Herbal Medicine Phytochemistry

Applications and Trends

Springer

Reference Series in Phytochemistry

This series provides a platform for essential information on plant metabolites and phytochemicals, their chemistry, properties, applications, and methods.

By the strictest definition, phytochemicals are chemicals derived from plants. However, the term is often also used to describe the large number of secondary metabolic compounds found in and derived from plants. These metabolites exhibit a number of nutritional and protective functions for human wellbeing and are used e.g. as colorants, fragrances and flavorings, amino acids, pharmaceuticals, hormones, vitamins and agrochemicals.

The series offers extensive information on various topics and aspects of phytochemicals, including their potential use in natural medicine, their ecological role, role as chemo-preventers and, in the context of plant defense, their importance for pathogen adaptation and disease resistance. The respective volumes also provide information on methods, e.g. for metabolomics, genetic engineering of pathways, molecular farming, and obtaining metabolites from lower organisms and marine organisms besides higher plants. Accordingly, they will be of great interest to readers in various fields, from chemistry, biology and biotechnology, to pharmacognosy, pharmacology, botany and medicine.

The Reference Series in Phytochemistry is indexed in Scopus.

Preface

The advancement of evidence-based herbal medicine practice relies on understanding the chemical composition of medicinal plants and their bioactive components. Utilization techniques in herbal medicine draw from the traditional wisdom, knowledge, understanding, and practices of local healers. To ensure the safety and effectiveness of herbal medicines, ongoing quality assessment, and research are essential to help bridge the gap between traditional knowledge and modern scientific and societal methods. Herbal medicine phytochemistry identifies bioactive plant compounds, their mechanism of action, standardized herbal products, and the validation of traditional remedies. Challenges include the need for scientific validation, quality control, regulatory compliance, etc. Opportunities exist in the discovery of new medicines as well as the integration of herbal medicine into mainstream conventional healthcare. Quality assessment such as the precise identification of plant and phytochemicals and advanced chemical analysis can boost the cultural and ethical aspects and provide background for establishing relevant regulatory frameworks. Herbal medicine phytochemistry research is vital to integrate herbal medicine into modern healthcare effectively.

This book, entitled *Herbal Medicine Phytochemistry: Applications and Trends*, presents a roadmap through a broad interdisciplinary collection of reviews written by researchers, intellectuals, experts, practitioners, and professionals. The book focuses on various aspects of phytochemistry and herbal medicine. It delves into the historical context and the classification of phytochemicals in plants with herbal value as well as their utilization patterns. The book explores the diversity of medicinal plants used to treat viral, parasitic, bacterial, and viral diseases, emphasizing their nutritional profiles, bioactive components, and therapeutic potential. It also looks into specific plants like *Cola acuminata*, *Rosmarinus officinalis*, *Garcinia kola*, *Citrus aurantifolia*, *Citrus aurantium*, *Aframomum melegueta*, *Solanum torvum*, and others. It discusses herbal medicine and the use of plants in managing and treating various health conditions, including cardiovascular, respiratory, neurological, gastrointestinal, skin, cancer, arthritis, reproductive issues, eye, wound healing potential, and pregnancy. The utilization approach and practices in herbal medicine were also explored to highlight the significance of chemopreventive practices, trends in orthodox medicine practices, and the role of xenobiotics in traditional medicine. It further discusses quality control strategies, utilization methods in Africa and Asia, the value of herbal medicine in sustainable development, and its socioeconomic impact. The synergy of artificial intelligence in traditional medicine and its role in addressing antimicrobial resistance is also discussed. The book looks into herbal medicine's quality assessment and research needs, emphasizing topics like chemical and microbial contamination of herbal remedies, regulations, policies, and sustainability. It also covers the application of biotechnology in herbal medicine; the use of big data in herbal medicine; research needs related to medicinal plants; conservation and sustainable use of these plants; sustainable supply chain management in the herbal medicine industry; and the intersection of business, sustainability, and herbal medicine.

The book will be useful to students (undergraduates and postgraduates), academicians, researchers, experts, and practitioners in the fields of natural, life, health, clinical, and biomedical sciences, such as pharmaceuticals, herbal medicine, pharmacology, pharmacognosy, phytochemistry, industrial, food and public health scientists, human nutrition and dietetics, plant biology, and biotechnology/microbiology clinicians.

Acknowledgments

Numerous individuals made significant contributions to ensure the successful completion of this book project. In particular, we thank the editors of the Reference Series in Phytochemistry, notably Prof. Kishan G. Ramawat, for his invaluable guidance and advice. We are equally thankful to the dedicated editorial team at Springer, including Ms. Lydia Mueller, Dr. Sofia Costa, Dr. Sylvia Blago, Ms. Johanna Klute, and others, for their unwavering commitment to the success of this book. Our heartfelt thanks also go to all the contributors who played a vital role in different work sections. We are grateful to our spouse and children for their patience, sacrifice, and understanding. To our mentors, we sincerely appreciate your shared knowledge, which has contributed to enriching humanity through this book.

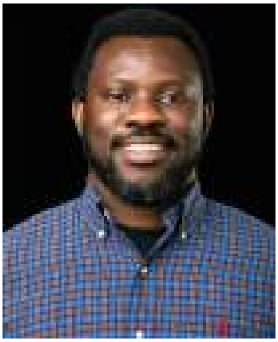
About the Editors

Dr. Sylvester Chibueze Izah
Bayelsa Medical University
Yenagoa, Bayelsa State, Nigeria

Dr. Sylvester Izah holds a Ph.D. in Public Health, and Applied Microbiology and Environmental Health, an M. Sc. in Applied Microbiology, and a B.Sc. in Biological Sciences from Niger Delta University, Nigeria. He is a licensed Environmental Health Specialist in Nigeria. He brings over ten years of experience from his work with an environmental consultancy firm specializing in soil, water, and atmospheric assessments. During the early stages of his career, Dr. Izah conducted studies on vegetation cover and biodiversity, focusing on species diversity, composition, and utilization. Presently, he serves as a lecturer at Bayelsa Medical University in Yenagoa, Nigeria, where he holds the position of Assistant Director of Academic Planning, Research, and Innovations. Dr. Izah's extensive research portfolio encompasses water, air, and soil quality, applied microbiology, biotechnology, public and environmental health, risk assessment, bioenergy, toxicology, medicinal plants, herbal medicine, and biodiversity. He has an impressive track record of over 300 peer-reviewed publications, including journal articles, book chapters, and edited books. Dr. Izah's Google Scholar total citation, h-index, and i10-Index are >6330, 44, and 169, respectively. His current research interests are centered around Sustainable Human-Environmental Health Interactions, covering areas such as environmental sustainability trends, toxicology, hygiene, sanitation, food science, public-environmental health assessment, medicinal plants, herbal medicine, bioactive and natural compounds, vegetation, and wildlife. Dr. Izah has also collaborated on research projects with colleagues worldwide and actively contributes as an editorial and review board member for several esteemed journals.



Prof. Matthew Chidozie Ogwu
Appalachian State University
Boone, NC, USA

Dr. Ogwu is an assistant professor of Integrated Ecology and Sustainable Development in the Goodnight Family Sustainable Development Department at Appalachian State University, USA. He obtained his Ph.D. in Biological Sciences with a research focus in the Molecular Biology of Soil Microbial and Geographical Ecology from Seoul National University. He holds an M.Sc. (Distinction) and a B.Sc. (First Class) in Plant Diversity and Conservation and Plant Biology and Biotechnology respectively from the University of Benin, Nigeria. After receiving his Ph.D., he worked as a researcher at the Centre for Floristic Research of the Apennines, Italy, where he contributed to numerous European Union-funded research including the famous NATURA 2000 project for sustainable ecosystem and biodiversity management. Before that, Dr. Ogwu was a lecturer at the University of Benin, Nigeria, where he taught courses in plant biology and biotechnology, biometry, economic botany, cytogenetics, etc., and supervised and co-supervised honors and graduate students' theses. Dr. Ogwu is an interdisciplinary academic with transdisciplinary skills pertinent to the assessment of coupled human and natural as well as socio-ecological systems and has numerous awards, research grants, and scholarships to his name. His research and teaching revolve around sustainable biodiversity and ecosystem management by assessing the realm of coupled systems for sustainable environmental development as well as addressing sustainable development issues arising from various scales of biogeographical interactions. Some of his research interests include soil microbial and geographical ecology, molecular and genomic characterization of economic plant species for breeding, conservation, and sustainable utilization as well as biodiversity issues and policies, climate change science, gut and fecal microbiota, bioinformatics, biosystems and bioeconomy, sustainable agriculture and food production systems, ethnoscience (including traditional biotechnological practices), land use patterns, waste management, microbial diversity, environmental and social systems integrity, landscape preservation, and pollution ecology. He is spearheading some convergence works (One Health and Eco Health) in the Human Environmental and Agricultural Laboratory (HEAL lab) at Appalachian State University. Dr. Ogwu has published over 100 peer-reviewed works including several in high-impact journals and has presented his results at different international conferences. Dr. Ogwu has attended numerous professional courses and serves on the board of and as a reviewer for many peer-reviewed international journals. He continues to volunteer his time and skills to promote sustainable community development, especially in the Global South. Dr. Ogwu is fluent in several languages and loves to travel and meet new people.

Dr. Muhammad Akram
Government College University Faisalabad
Faisalabad, Pakistan

Dr. Muhammad Akram is an associate professor in the Department of Eastern Medicine, Government College University Faisalabad, Pakistan, where he serves as the chairman of his Department. He received his Ph.D. from Hamdard University, Karachi, Pakistan, in 2013. Dr. Akram was chairman of the Department of Eastern Medicine and Surgery, University of Poonch, Rawalakot Azad Kashmir from 2015 to 2017. He received many honors and awards during his career. He serves as an editor and invited reviewer of several national and international journals. He has numerous publications and presentations to his credit, and he is an active member of several professional societies. Dr. Akram has authored and co-authored 16 books, 74 book chapters, and over 350 journal articles. Dr. Akram's research interests include hyperuricemia, xanthine oxidase inhibition by some selected medicinal plants, enzyme inhibition, traditional medicine, phytochemistry, poisonous plants, bioactivity, and phytopharmaceutical evaluation of herbal drugs and their natural products, biochemistry, and bioinformatics.

An Introduction to Herbal Medicine Phytochemistry: Applications and Trends

Background

The advancement of evidence-based herbal medicine hinges on a comprehensive grasp of the chemical makeup of medicinal plants and their bioactive elements, with phytochemistry as an indispensable element in this endeavor. The utilization techniques and approaches in herbal medicine, often involving the preparation of plant extracts and remedies with a historical lineage, are deeply rooted in traditional wisdom and the expertise of local healers. To guarantee the safety, effectiveness, and uniformity of herbal medicines, continual quality assessment and research efforts are imperative, especially as integrating modern scientific methodologies gains increasing significance within this field.

This book has three main components: phytochemistry and herbal medicine, utilization approach and practices in herbal medicine, and quality assessment and research needs of herbal medicine (Fig. 1).

Phytochemistry and Herbal Medicine

Phytochemistry is the field of chemistry that looks into plant compounds' molecular structures. It involves the breakdown, separation, characterization, and identification of the numerous chemical constituents present in plants, encompassing a wide range of compounds like terpenes, alkaloids, flavonoids, phenolic compounds, etc. Phytochemistry plays a pivotal role in comprehending the chemical composition of plants and their possible applications, particularly in medicine. The major facets of phytochemistry are summarized in Fig. 2.

Botanical medicine, also known as herbal medicine or phytotherapy, typically involves utilizing plant-based substances for their therapeutic properties. This traditional healing approach has served as a primary treatment method across various cultures worldwide for millennia, encompassing a diverse array of civilizations. The main elements of herbal medicine are summarized in Fig. 3.

Herbal medicine and phytochemistry are closely intertwined fields. Phytochemistry plays a pivotal role in identifying and isolating bioactive plant compounds,

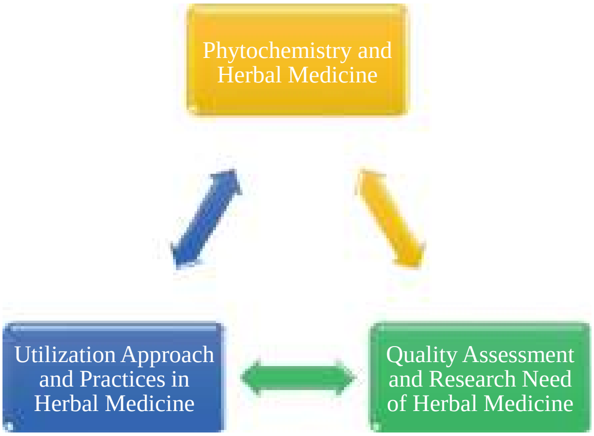

Fig. 1 Aspects of herbal medicine phytochemistry: trends and applications

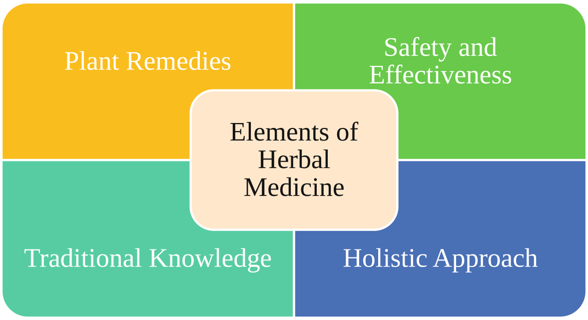
Fig. 2 The major facets of phytochemistry

which are subsequently employed in herbal medicine. This scientific understanding not only promotes the development of standardized herbal products, ensuring consistency in dosage and quality, but also substantiates the legitimacy of traditional herbal remedies by unveiling their chemical composition and pharmacological effects.

Both phytochemistry and herbal medicine share common challenges and potential prospects. Obstacles include the need for rigorous scientific validation, quality control of the products, and addressing regulatory issues. Nonetheless, they also

Fig. 3 The main elements of herbal medicine



offer promising opportunities, such as the potential for discovering novel medications, more potent natural remedies, and the integration of complementary and alternative medicine into mainstream healthcare.

This part of the book has 33 chapters which are summarized as follows:

i. Historical Perspectives and Overview of the Value of Herbal Medicine: Herbal medicine has a rich historical context and continues to play a crucial role in healthcare, offering a holistic approach to healing by harnessing the therapeutic potential of plant-based remedies.
ii. Plant Food for Human Health: Case Study of Indigenous Vegetables in Akwa Ibom State, Nigeria: Indigenous vegetables in Akwa Ibom State, Nigeria, hold substantial nutritional value, emphasizing the importance of these local plant foods in promoting human health and well-being.
iii. Classification of Phytochemicals in Plants with Herbal Value: The classification of phytochemicals within plants with herbal value provides insights into the diverse compounds responsible for their medicinal properties, facilitating a deeper understanding of their therapeutic potential.
iv. Nutritional Profile, Bioactive Components, and Therapeutic Potential of Edible Flowers of Chhattisgarh, India: Edible flowers in Chhattisgarh, India, are not only nutritionally rich but also contain bioactive components that offer therapeutic benefits, making them a valuable resource for both food and health.
v. Phytochemical Constituents of *Rosmarinus officinalis* Linn. and Their Associated Role in the Management of Alzheimer's Disease: *R. officinalis* harbors phytochemical constituents that may contribute to the management of Alzheimer's disease, shedding light on its potential role in neurological health.
vi. Plants Used in the Management and Treatment of Male Reproductive Health Issues: Case Study of Benin People of Southern Nigeria: The Benin people in Southern Nigeria rely on specific plants for the management and treatment of male reproductive health issues, illustrating the significance of traditional herbal remedies in addressing such concerns.

vii. *Cola acuminata*: Phytochemical Constituents, Nutritional Characteristics, Scientific Validated Pharmacological Properties, Ethnomedicinal Uses, Safety Considerations, and Commercial Values: *Cola acuminata* exhibits a diverse range of phytochemical constituents, nutritional properties, validated pharmacological benefits, cultural significance, safety considerations, and commercial value, making it a multi-faceted plant of interest.

viii. Diversity of Medicinal Plants Used in the Treatment and Management of Viral Diseases Transmitted by Mosquitoes in the Tropics: Medicinal plants in tropical regions serve as a diverse resource for treating viral diseases transmitted by mosquitoes, offering potential solutions to public health challenges.

ix. Medicinal Plants in the Tropics Used in the Treatment and Management of Parasitic Diseases Transmitted by Mosquitoes: Administration, Challenges, and Strategic Options for Management: Medicinal plants in tropical areas are integral in combating parasitic diseases transmitted by mosquitoes, though challenges in administration require strategic management approaches.

x. Efficacy of Ethnoherbal Medicines with Anti-inflammatory and Wound Healing Potentiality: A Case of West Bengal, India: Ethnoherbal medicines in West Bengal, India, demonstrate efficacy in anti-inflammatory and wound healing applications, highlighting their valuable role in traditional healthcare.

xi. Classification Methods and Diversity of Medicinal Plants: The categorization of medicinal plants sheds light on the rich diversity of plant species used in traditional medicine worldwide. Also, the classification methods provide insights into the vast array of medicinal plants employed for diverse health purposes.

xii. Plants Used in the Management and Treatment of Cardiovascular Diseases: Case Study of the Benin People of Southern Nigeria: The Benin people in Southern Nigeria use herbs to manage and treat cardiovascular diseases, thereby offering valuable insights into traditional remedies for heart health. This practice also highlights the potential of indigenous knowledge in cardiovascular disease management, thereby bridging the gap between traditional and modern medicine.

xiii. Mechanistic Approaches of Herbal Medicine in the Treatment of Arthritis: The mechanism by which herbal medicine effectively treats arthritis, thereby contributing to the understanding of alternative therapies for debilitating conditions. The elucidation of the mechanisms may offer a scientific foundation for the use of herbal remedies in arthritis treatment.

xiv. Phytochemicals and Overview of the Evolving Landscape in Management of Osteoarthritis: The exploration of phytochemicals in osteoarthritis management provides an overview of how bioactive compounds found in plants are shaping the evolving landscape of treatment options.

xv. Assessment of the Phytochemical Constituents and Metabolites in the Medicinal Plants and Herbal Medicine Used in the Treatment and Management of Respiratory Diseases: The assessment scrutinizes the phytochemical constituents and metabolites in medicinal plants and herbal remedies, thereby focusing on their application in the treatment and management of respiratory diseases. This could contribute to the understanding of the therapeutic properties of herbal remedies for respiratory conditions.

xvi. Assessment of the Phytochemical Constituents and Metabolites in Medicinal Plants and Herbal Remedies Used in the Treatment and Management of Reproductive Diseases: Polycystic Ovary Syndrome: The phytochemical constituents and metabolites in medicinal plants and herbal remedies could be essential in the treatment of reproductive diseases such as polycystic ovary syndrome (PCOS). Findings could help address a critical area of herbal medicine application in women's healthcare.

xvii. Assessment of the Phytochemical Constituents and Metabolites in the Medicinal Plants and Herbal Medicine Used in the Treatment and Management of Skin Diseases: Phytochemical constituents and metabolites found in medicinal plants and herbal medicine emphasize their significance in the treatment and management of skin diseases. This chapter sheds light on the potential of herbal remedies in dermatological care.

xviii. Metabolites and Phytochemicals in Medicinal Plants Used in the Management and Treatment of Neurological Diseases: The role of metabolites and phytochemicals in medicinal plants and their application in managing and treating neurological diseases, providing insights into alternative therapeutic approaches for brain-related conditions. This contributes to the growing body of knowledge about herbal remedies for neurological health.

xix. Diabetes Treatment and Prevention Using Herbal Medicine: The chapter centers on using herbal medicine to treat and prevent diabetes, offering a holistic and natural approach to managing this prevalent metabolic disorder. This chapter underscores the potential of herbal remedies as a complementary strategy for diabetes care and prevention.

xx. Therapeutic Applications of Herbal Medicines for the Prevention and Management of Cancer: This chapter explores the potential of herbal remedies in preventing and managing cancer, focusing on their therapeutic applications and outcomes.

xxi. Herbs and Herbal Formulations for the Management and Prevention of Gastrointestinal Diseases: This chapter looks into the use of medicinal plants and herbal formulations to address gastrointestinal disorders, thereby shedding light on their role in disease prevention and management.

xxii. Herbal Medicine and Pregnancy: This chapter addresses herbal medicine during pregnancy, providing insights into its safety and efficacy, and emphasizing the well-being of expectant mothers.

xxiii. Herbal Medicine and Rheumatic Disorders Management and Prevention: This chapter discusses how herbal remedies can be employed to manage and prevent rheumatic disorders, highlighting their potential to improve the quality of life for affected individuals.

xxiv. Physiological and Biochemical Outcomes of Herbal Medicine Use in the Treatment of Hypertension: This chapter offers an overview of herbal medicine's physiological and biochemical effects on hypertension, shedding light on its role as an alternative treatment.

xxv. Evidence from the Use of Herbal Medicines in the Management and Prevention of Common Eye Diseases: This chapter provides evidence-based insights into utilizing herbal medicines for managing and preventing common eye diseases, emphasizing their potential benefits.

xxvi. Assessment of the Phytochemical Constituents and Metabolites of Some Medicinal Plants and Herbal Remedies Used in the Treatment and Management of Injuries: This chapter assesses the phytochemical constituents and metabolites of medicinal plants and herbal remedies used in injury treatment and management.

xxvii. Plants Used in the Management and Treatment of Female Reproductive Health Issues: Case Study from Southern Nigeria: This chapter offers a case study of plants used in the treatment of female reproductive health issues, focusing on the practices in Southern Nigeria.

xxviii. *Citrus aurantium*: Phytochemistry, Therapeutic Potential, Safety Considerations, and Research Needs: This chapter presents an overview of *Citrus aurantium*, discussing its phytochemical composition, therapeutic potential, safety considerations, and areas for further research.

xxix. Medicinal Spice, *Aframomum melegueta*: An Overview of the Phytochemical Constituents, Nutritional Characteristics, and Ethnomedicinal Values for Sustainability: This chapter provides an overview of *A. melegueta*, highlighting its phytochemical constituents, nutritional characteristics, and cultural significance for sustainability.

xxx. "Turkey berry (*Solanum torvum* Sw. [Solanaceae]): An Overview of the Phytochemical Constituents, Nutritional Characteristics, and Ethnomedicinal Values for Sustainability: This chapter discusses *S. torvum* and its phytochemical constituents, nutritional qualities, and ethnomedicinal significance in the context of sustainability.

xxxi. *Garcinia kola* Heckel. (Clusiaceae): An Overview of the Cultural, Medicinal, and Dietary Significance for Sustainability: This chapter explores the cultural, medicinal, and dietary importance of *G. kola*, emphasizing its role in sustainable practices.

xxxii. *Vernonia amygdalina* Delile (Asteraceae): An Overview of the Phytochemical Constituents, Nutritional Characteristics, and Ethnomedicinal Values for Sustainability: This chapter provides an overview of *V. amygdalina*, focusing on its phytochemical constituents, nutritional attributes, and ethnomedicinal value within the context of sustainability.

xxxiii. *Citrus aurantifolia*: Phytochemical Constituents, Food Preservative Potentials, and Pharmacological Value: This chapter focuses on *C. aurantifolia*, detailing its phytochemical components, potential for use as a food preservative, and its pharmacological value.

Utilization Approach and Practices in Herbal Medicine

Herbal medicine has a rich history of transcending cultures, emphasizing plant diversity, traditional knowledge, and holistic care. It has influenced medicine throughout history, with roots in traditional systems, European herbalism, and a twentieth-century resurgence. Today, herbal medicine finds uses in supplements, integrative healthcare, and personalized medicine. Despite its growth, it faces challenges including quality control, safety concerns, the need for scientific evidence, and ethical issues related to cultural appropriation (Fig. 4). Therefore, herbal medicine's holistic, plant-based approach remains significant, requiring continued research and responsible practices to ensure its safety and effectiveness in contemporary healthcare.

This part of the book has 16 chapters which are summarized as follows:

i. Chemopreventive Practices in Traditional Medicine: This chapter focuses on traditional medicine incorporated in a wide range of practices aimed at preventing disease, including dietary modifications and the use of specific medicinal plants, often rooted in historical knowledge and cultural traditions.
ii. Chemopreventive Strategies in Herbal Medicine Practice: Current Aspects, Challenges, Prospects, and Sustainable Future Outlook: This chapter focuses on herbal medicine practices especially chemopreventive strategies, with a focus on identifying specific medicinal plants and phytochemicals that exhibit cancer prevention properties, which can contribute to mainstream healthcare but face challenges in terms of standardization and regulatory compliance. Furthermore, the sustainable future outlook for herbal medicine in chemoprevention lies in strengthening scientific validation, addressing quality control

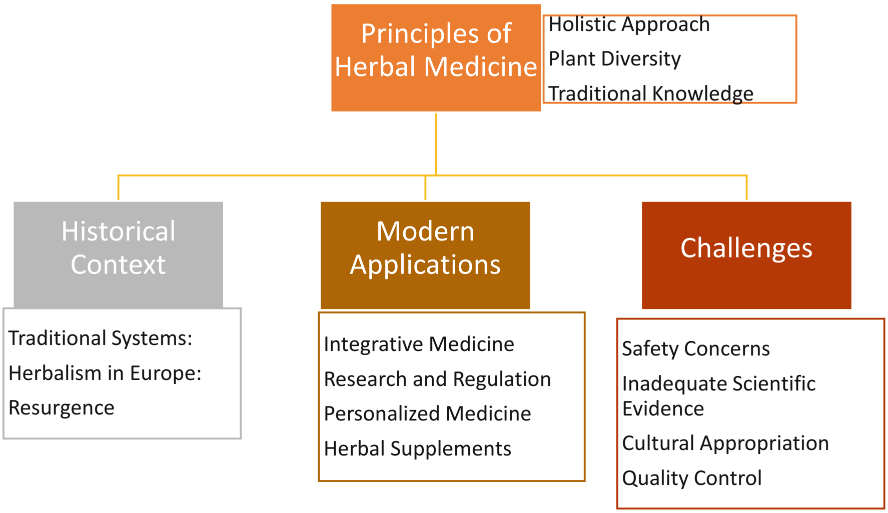


Fig. 4 Overview of the utilization approach and practices in herbal medicine

concerns, and fostering greater collaboration between traditional knowledge and modern research.

iii. Sustainable Current Trends and Future Directions in Orthodox Medicine Practice in Sierra Leone: In Sierra Leone, orthodox medicine practices are experiencing a shift toward more sustainable and community-oriented healthcare delivery, emphasizing accessibility, affordability, and cultural relevance. The future of orthodox medicine in Sierra Leone holds the promise of improved healthcare infrastructure, strengthened primary care, and integration with traditional healing practices to provide holistic health services.

iv. Herbal Medicine: A Case Study of Kherias, Lodhas, and Mundas Tribes in Southwest Bengal of India: The Kherias, Lodhas, and Mundas tribes in Southwest Bengal have preserved and continue to practice herbal medicine, employing a rich repertoire of plant-based remedies passed down through generations. This case study highlights the cultural significance and knowledge preservation of indigenous herbal medicine and underscores the need for their inclusion in discussions on healthcare sustainability.

v. Herbal Medicine—Exploring Its Scope Across Belief Systems of Indian Medicine: Herbal medicine in India transcends various belief systems, including Ayurveda, Siddha, and Unani, demonstrating a holistic approach to health and well-being that combines ancient knowledge with contemporary healthcare practices. This exploration sheds light on the versatility of herbal medicine across belief systems, fostering a more comprehensive understanding of its potential benefits.

vi. Xenobiotics in Traditional Medicine Practices and Quality Control Strategies: Traditional medicine practices sometimes involve the use of xenobiotics, foreign substances that require rigorous quality control measures to ensure safety and efficacy. Addressing the presence of xenobiotics in traditional medicine underscores the importance of quality control and regulation in these practices to safeguard public health.

vii. Herbal Medicine for Health Management and Disease Prevention: Herbal medicine offers an array of preventive and health management solutions, demonstrating its potential to reduce the burden of chronic diseases and improve overall well-being. The utilization of herbal medicine in health management presents an opportunity for a more holistic and cost-effective approach to healthcare.

viii. Utilization Methods and Practices of Herbal Medicine in Africa: Across Africa, diverse utilization methods and practices of herbal medicine are integral to healthcare, driven by cultural traditions and local knowledge. Understanding the rich tapestry of herbal medicine practices in Africa is vital for enhancing healthcare accessibility and addressing health disparities on the continent.

ix. Herbal Medicine Methods and Practices in Nigeria: In Nigeria, herbal medicine methods and practices have been deeply rooted in the culture and tradition, often involving the use of locally sourced plants and knowledge passed down through generations. These methods include the preparation of decoctions, infusions, and the use of specific plant parts for various ailments, showcasing the rich diversity of herbal remedies within the country.

x. Value of Herbal Medicine to Sustainable Development: Herbal medicine plays a vital role in sustainable development by offering affordable and locally available healthcare solutions, reducing the strain on modern healthcare systems and pharmaceutical industries. Additionally, the cultivation and sustainable harvesting of medicinal plants for herbal medicine contribute to biodiversity conservation and support the livelihoods of many rural communities.

xi. Herbal Medicine and Sustainable Development Challenges and Opportunities: Challenges related to herbal medicine and sustainable development include the need for quality control, standardization, and regulations to ensure safe and effective herbal remedies. However, opportunities lie in the potential for herbal medicine to provide alternative, ecofriendly healthcare solutions and promote sustainable practices in plant cultivation and harvesting.

xii. Current Trends on Phytochemicals Toward Herbal Medicine Development: Current trends in phytochemical research focus on identifying and isolating bioactive compounds from plants, understanding their mechanisms of action, and exploring their potential in developing new herbal medicines. The use of advanced analytical techniques and bioinformatics is enhancing our knowledge of phytochemicals, driving innovation in herbal medicine development.

xiii. Proximate Analysis of Herbal Drugs: Methods, Relevance, and Quality Control Aspects: Proximate analysis is essential for determining the nutritional and chemical composition of herbal medicine, ensuring its quality, safety, and efficacy. These methods are highly relevant in quality control, enabling the detection of contaminants and variations in herbal drug preparations, which is crucial for consumer safety and regulatory compliance.

xiv. Socioeconomic Values of Herbal Medicine: Herbal medicine contributes significantly to the socioeconomic well-being of communities involved in its production and trade, offering employment opportunities and income generation. Moreover, it serves as an accessible and cost-effective healthcare option for many people, particularly in regions with limited access to modern medicine.

xv. Harmonizing Tradition and Technology: The Synergy of Artificial Intelligence in Traditional Medicine: The integration of artificial intelligence with traditional medicine practices holds promise in enhancing the diagnosis, treatment, and management of health conditions based on extensive data analysis and predictive algorithms. This harmonization of tradition and technology showcases the potential for artificial intelligence to support the preservation and modernization of traditional medicine.

xvi. Antimicrobial Resistance and the Role of Herbal Medicine: Challenges, Opportunities, and Future Prospects: Herbal medicine presents opportunities to address antimicrobial resistance by providing alternative treatment options and potentially reducing the overuse of antibiotics. However, challenges include the need for scientific validation, quality control, and regulatory frameworks to harness the full potential of herbal medicine in combating this global health threat.

Quality Assessment and Research Needs of Herbal Medicine

Assessing the quality of herbal medicine is integral to ensuring the safety and reliability of these natural products. This process involves several key considerations, including precise plant identification to reduce the risk of adverse effects and contamination (Fig. 5). Advanced chemical analysis techniques, such as spectroscopy and chromatography, are essential for determining the chemical composition of herbal extracts and standardizing formulations. Moreover, establishing quality control protocols and guidelines is crucial to maintaining uniformity, safety, and potency in herbal products (Fig. 5).

There is a growing acceptance of herbal medicine in healthcare, but it requires further research to advance and integrate it into modern medical practices. This necessitates comprehensive studies to validate the therapeutic benefits and safety profiles of herbal remedies, addressing the concerns of both patients and healthcare professionals. Investigating the phytochemical composition of medicinal plants is vital to understanding the bioactive components underlying their therapeutic effects, facilitating the development of evidence-based herbal treatments. Furthermore, research must uncover potential interactions between herbal and pharmaceutical drugs to ensure patient safety and effective treatment approaches (Fig. 5). Acknowledging herbal medicine's cultural and ethical aspects is essential to preserve

Fig. 5 Quality assessment of herbal medicine practices

indigenous practices and prevent the exploitation of traditional knowledge. Strict regulatory frameworks, encompassing labelling laws and quality requirements, are needed to safeguard consumer confidence and public health. Additionally, more research is needed to determine how herbal medicine can be seamlessly integrated into conventional healthcare practices, considering its potential in complementary and alternative medicine approaches.

Research and quality assessment in herbal medicine (Fig. 6) are imperative for ensuring safety and effectiveness. First, accurate botanical identification is crucial, as using the wrong plant species can be harmful or ineffective; modern techniques like DNA barcoding and microscopy aid in precise identification. Moreover, the growing conditions of medicinal plants, influenced by factors like farming practices, climate, and soil quality, significantly affect their chemical composition and therapeutic potential, necessitating careful consideration for consistent quality. Good agricultural and collection practice provides a sustainable cultivation and harvesting framework, emphasizing quality control throughout production. Detection of authentication and adulteration is essential, as periodic substitutions with subpar or hazardous components can occur; analytical techniques like high-performance liquid chromatography and mass spectrometry help identify adulterants. Additionally, standardization of extraction, processing, and herbal product combination methods is essential for ensuring uniform quality and therapeutic efficacy (Fig. 6).

This part of the book has 19 chapters which are summarized as follows:

Fig. 6 Research needs in herbal medicine

i. Trace Metals Contamination of Herbal Remedies: Trace metals contamination in herbal remedies poses health risks due to potential toxic effects. Stringent quality control measures and standards are necessary to ensure consumer safety. Regulations and policies should address trace metal limits in herbal medicines, monitor their presence, and enforce compliance to safeguard public health.
ii. Regulations and Policies for Herbal Medicine and Practitioners: Establishing comprehensive regulations and licensing for herbal medicine practitioners is essential to ensure patient safety and standardize the practice. Striking a balance between traditional knowledge and modern regulations is key to promoting the integration of herbal medicine into mainstream healthcare systems.
iii. Toward Sustainability in the Source of Raw Materials for Herbal Remedies: Sustainable harvesting and cultivation practices are vital to conserve medicinal plant species and maintain a consistent supply of herbal remedies. Developing guidelines and incentives for sustainable sourcing can help preserve biodiversity and support local communities.
iv. Microbial Contaminants of Herbal Remedies: Health Risks and Sustainable Quality Control Strategies: Microbial contamination in herbal remedies can jeopardize consumer health. Quality control strategies, such as microbial testing and Good Manufacturing Practices, are essential for product safety. Sustainable sourcing, processing, and storage practices can mitigate microbial contamination risks in herbal medicines.
v. Adoption and Application of Biotechnology in Herbal Medicine Practices: The integration of biotechnology offers opportunities to enhance the quality, efficacy, and safety of herbal medicines. Regulation and ethical considerations must guide its responsible application. Biotechnological methods like tissue culture and genetic profiling can aid in the cultivation and conservation of valuable medicinal plant species.
vi. Challenges and Future of Nanotechnology in Global Herbal Medicine Practices: Nanotechnology holds promise for improving drug delivery and enhancing the therapeutic potential of herbal medicines, but challenges related to safety and regulation must be addressed. Collaborative efforts among scientists, regulators, and herbal practitioners are crucial to unlock the full potential of nanotechnology in herbal medicine.
vii. Eco-metabolomic Studies of Medicinal Plants and Herbal Medicine: Eco-metabolomic studies provide insights into the interactions between medicinal plants and their environments, aiding in sustainable cultivation and conservation efforts. This ecological perspective can guide the responsible use of medicinal plants and the development of herbal medicine industry practices that support environmental health.
viii. Physiological Ecology of Medicinal Plants: Implications for Phytochemical Constituents: Understanding the physiological ecology of medicinal plants helps elucidate how environmental factors influence the production of bioactive compounds, contributing to the standardization of herbal remedies.

Conservation strategies should consider the ecological requirements of medicinal plants to ensure a stable supply of quality raw materials.

ix. Big Data Application in Herbal Medicine – the Need for a Consolidated Database: The accumulation of big data can revolutionize herbal medicine research and practice, but a consolidated, accessible database is essential to harness this potential fully. Data sharing and standardized data collection methods can facilitate collaborative research and evidence-based decision-making in herbal medicine.

x. Challenges in the Storage of Herbal Medicine Products and Strategies for Sustainable Management: Proper storage of herbal medicine products is crucial to maintaining their efficacy and safety. Sustainable packaging and storage solutions can reduce environmental impacts. Strategies should address issues like humidity control and temperature stability, ensuring the long-term viability of herbal remedies.

xi. Herbal Medicine Formulation, Standardization, and Commercialization Challenges and Sustainable Strategies for Improvement: Herbal medicine formulation and standardization are necessary to ensure consistent product quality and efficacy. Sustainable practices can enhance market competitiveness. Collaboration between traditional healers, scientists, and industry stakeholders can lead to improved formulations and sustainable commercialization of herbal remedies.

xii. Research Needs of Medicinal Plants Used in the Management and Treatment of Some Diseases Caused by Microorganisms: Research is crucial to identify and develop herbal remedies for diseases caused by microorganisms. Collaboration between researchers and traditional healers can expedite discovery and validation. Addressing research needs can lead to the development of effective, evidence-based herbal treatments for infectious diseases.

xiii. Conservation and Sustainable Uses of Medicinal Plants Phytochemicals: Medicinal plants play a crucial role in traditional healthcare, with phytochemicals as their active compounds. Conservation efforts are essential to ensure the sustainable use of these plants, preserving their phytochemical richness and cultural significance.

xiv. Threats and Conservation Strategies of Common Edible Vegetables that Possess Pharmacological Potentials in Nigeria: Common edible vegetables in Nigeria possess valuable pharmacological properties, but they face threats from habitat loss and overharvesting. To safeguard these resources, conservation strategies must be developed to balance nutritional needs with sustainability.

xv. Sustainable Supply Chain Management in the Herbal Medicine Industry: Herbal medicine relies on various plant resources, making sustainable supply chain management crucial to ensure a consistent and ethical source of ingredients, while also supporting the livelihoods of local communities involved in cultivation and harvesting.

xvi. Consumer Perception and Demand for Sustainable Herbal Medicine Products and Market: Consumer demand for herbal medicine products with sustainability and ethical sourcing practices is on the rise. Understanding consumer perceptions and preferences is key to creating a thriving market for sustainable herbal remedies.

xvii. Indigenous Knowledge and Phytochemistry: Deciphering the Healing Power of Herbal Medicine: Indigenous knowledge plays a vital role in understanding the healing potential of herbal medicine. By combining traditional wisdom with modern phytochemistry, we can unlock the therapeutic properties of these natural remedies.

xviii. The Nexus of Business, Sustainability, and Herbal Medicine: The intersection of business, sustainability, and herbal medicine is an exciting frontier. It involves innovative approaches to commercializing herbal products while promoting environmentally friendly practices and ethical standards in the industry.

xix. Healing Trails: Integrating Medicinal Plant Walks into Recreational Development: Integrating medicinal plant walks into recreational development creates a unique experience for nature enthusiasts. These trails offer a blend of education, wellness, and conservation by introducing people to the world of medicinal plants while ensuring their sustainable use.

Conclusion

Herbal Medicine Phytochemistry: Applications and Trends offers a comprehensive exploration of the dynamic and ever-evolving world of herbal medicine and phytochemistry. Throughout this book, the rich tapestry of natural compounds found in plants, their intricate chemistry, and their diverse applications in healthcare, wellness, and beyond are presented. This is paramount considering the remarkable resurgence of interest in traditional herbal remedies, driven by the pursuit of natural alternatives, sustainability, and a profound understanding of the phytochemical treasures hidden within the plant kingdom, ancient cultures, and societies.

The book will take readers on a journey from the historical roots of herbal medicine to its modern renaissance, showcasing the valuable contributions of phytochemistry in unlocking the secrets of these medicinal plants. From the laboratories to the fields, it has revealed the diverse applications of herbal medicine, encompassing its use in traditional healing, mainstream healthcare, dietary supplements, and even cosmetics. It explores the transformative power of phytochemistry in identifying, isolating, and harnessing bioactive compounds that have the potential to combat diseases, alleviate symptoms, and enhance well-being. The innovative chapters featured in this book have illuminated the promising future of phytochemicals in modern medicine, paving the way for novel drug development, the creation of herbal formulations, and the enhancement of healthcare practices. It underscores the importance of responsible sourcing, sustainability, and quality control in the herbal medicine industry, highlighting the need to preserve nature's biodiversity and protect the heritage of indigenous knowledge. It has emphasized the imperative for rigorous research, safety evaluations, and standardized formulations to ensure that herbal medicine remains a safe and effective choice for individuals seeking natural solutions.

In a world where the demand for holistic and sustainable approaches to health is growing, *Herbal Medicine Phytochemistry: Applications and Trends* serves as an invaluable resource, shedding light on the boundless potential of phytochemistry and its impact on our lives. The book is a testament to the enduring significance of herbal medicine and the pivotal role of phytochemistry in the ongoing quest for wellness and the harmonious coexistence of humanity with the natural world. It is noteworthy that the world of herbal medicine and phytochemistry is a constantly evolving landscape. It is our hope that this book will provide readers, professional, practitioners, researchers, students, and enthusiasts with a deeper understanding of these fields and inspire curiosity, further research, policy establish, and responsible engagement. With this knowledge, we can look forward to a future where the healing powers of nature are harnessed, celebrated, and integrated into the healthcare systems of tomorrow.

Abstract

Herbal medicine practices are as old as human history. Plants have been used to treat and manage different disease conditions in different parts of the world since time immemorial. Currently, about 80% of the global population uses herbal medicine directly or indirectly to manage or treat disease conditions. The use of plants to treat diseases depends on the local knowledge and cultural practices of the indigenous people of the area and requires a certain level of inborn skills or formal/informal training for the efficient and effective utilization of the herbal formulations. In herbal medicine, plants are used for spiritual processes including libation, sacrifice, appeasing of the gods, invocation, divination, food preparation, and as medicine. Whole plant or their parts are formulated into herbal medicine that is dependent on the bioactive constituents of the plant and their parts. Some diseases that have been successfully managed using herbal medicine include memory loss, cardiovascular issues, arthritis, osteoarthritis, digestive and respiratory diseases, reproductive problems, skin diseases, neurological issues, diabetes, diverse types of cancers, hypertension, and many others. Herbal medicines may be utilized in powder or liquid form and depending on the ailment may be ingested or externally applied on the affected parts of the body, but dosages are often unspecified or unclear. Herbal medicine is at a critical development stage, and there is a need for research and regulatory policies to support and standardize the processes involved in the exploration of raw materials, production of herbal remedies, branding, and marketing as well as sustainable utilization. Through research and regulatory policy, there will be greater clarity about herbal medicine processing, procedures, delivery routes, dosages, and compatibility, which will position the agelong process to be competitive, integrated into, or practiced alongside conventional medicine.

1 Introduction

Medicinal plants are the source and foundation for the effectiveness and efficacy of both traditional and modern medicine. In both industrialized and developing countries, medicinal plants are crucial in the management of diseases and are the foundation for many maladies that have been treated for thousands of years [85]. Traditional medicine is becoming more popular in both developed and developing nations due to its natural origins and perceived lack of negative side effects. Herbal medicine has gained increased attention at the policy level, as evidenced by the

Astana Declaration on Primary Healthcare [12], which promotes the impartial integration of both herbal medicine and scientific knowledge in basic healthcare. The declaration calls for greater political commitment to organizations and individuals that contribute to the provision of primary healthcare to everyone around the world. Herbal medicine is vital to primary healthcare because of the knowledge and capacity-building considerations. Nonetheless, it is impossible to not overstate the therapeutic significance of traditional medicine.

According to the World Health Organization (WHO), around 80% of the people in the world are reliant on herbal medicine for their basic healthcare needs ([85]; WHO, [208]). Based on the most recent estimates, two-thirds of the global populace are heavily reliant on unorthodox medical treatments because they are more widely accessible, more affordable, and more in line with patients' ideologies, placate the fears of negative effects from chemosynthetic medicines, satisfy the inclination for individualized healthcare, and enable widespread public access to personal and relevant health records [1, 37, 40]. As a result, several more individuals have embraced the use of indigenous plants. Chemically synthesized drugs are widely spread over the past century and have profoundly reformed medical services in several countries across the globe. Nevertheless, a larger fraction of the developing nation population continues to depend on natural remedies and traditional alternative medicine practitioners for their primary care. At least 90% of the African populace and 70% of the Indian descendants count on herbal medicine to aid and/or satisfy their healthcare needs [30, 49, 120]. Over 40% of all healthcare services provided in China are traditional medicine, whereas over 90% of general hospitals already established departments for traditional health medicine practice [54, 211, 216]. Furthermore, the use of traditional medicine is not restricted to third-world nations only; the last 200 years have witnessed an upsurge in the people's interest in natural remedies in developed nations, along with an expansion of the use of ethnobotanicals. Herbal medicine is at the heart of several healthcare systems across the globe – Western Herbal Medicine (WHM) is practiced in New Zealand, Canada, Australia, Great Britain, and Western Europe; Traditional Chinese Medicine (TCM) in China; Ayurveda in India; and Kampo in Japan. In addition, a variety of over-the-counter medicines approved by the European Union's Traditional Herbal Medicinal Product Regulation are widely available in pharmacies [62].

This chapter aims to provide a historical background to herbal medicine resources, practices and techniques, products, values, and challenges to the promotion of the agelong medical practice and highlight areas in need of attention to help increase the competitiveness of the practice and help integrate it into or ensure it is sustainably practiced alongside conventional medicine. It is organized into five parts – history of herbal medicine, utilization of herbal medicine, herbal medicine techniques, trends in herbal medicine, and herbal medicine research needs. This is the oldest form of medicine known to humans all over the world and is proven to be effective in the treatment and management of diverse diseases and ill health conditions. This work highlights the need for globally standardized procedures and research support to help clarify processing methods, routes of administration, doses, and compatibility issues.

2 Historical Perspectives of Herbal Medicine

It is difficult to clearly distinguish the history of herbal medicine into different eras because human societies evolved different herbal medicine practices and systems in isolation which contributed to the various forms of medicine available today. However, here we adopt a system that presents the views and historical practices of herbal medicine in some ancient human societies around different parts of the world, and these are arranged in no particular order.

2.1 Ancient Babylonians

The ancient Babylonians used plants as medical remedies as far back as 60,000 years ago. Written accounts of herbal medicine are at least 5000 years old in China and 2500 years old in Asia Minor and Greece [160]. There are several herbal medical systems, and each one's beliefs and practices are shaped by the area where it initially emerged [211]. Traditional Chinese medicine, which has been practiced for centuries, is the country's unique system [202]. The world's first known herbal book was published over 2000 years ago (*Devine Farmer's Classic of Herbalism*) and was written in China. Many herbal pharmacopeias and other monographs on certain plants are also available [200].

2.2 Ancient Hindustani Doctors

Ancient Hindu doctors and saints established Ayurveda, a medical system that has been practiced in India for over 5000 years. In its material medica, more than 1500 plants and 10,000 formulas are fully described. In contrast to Western medicine, the Indian government has acknowledged Ayurveda as a full healthcare system [53]. The Japanese herbal medication Kampo medicine has roughly 148 formulas and is over 1500 years old [205]. The majority of people continue to practice Ayurvedic medicine in India, Kampo medicine in Japan, Traditional Chinese Medicine, and Unani medicine in the Middle East and South Asia. The demand for herbal medicine and other botanicals by Western cultures has been continuously rising in the recent herbal renaissance period. Acupuncture and herbal treatment, which are both parts of TCM, are now more popular than ever in Western nations [21]. Together with herbal medications, other herbal items including cosmetics, perfumes, teas, health foods, and nutraceuticals are also widely used and make up a sizable component of the worldwide herbal market.

In actuality, it likely predates contemporary *Homo sapiens*. In Neanderthal graves in Iraq going back 60,000 years, archaeologists have discovered pollen and flower pieces from several different medicinal plants. Among them were species of *Ephedra*, *Centaurea*, *Senecio*, *Althea*, and *Achillea*. This can be evidence of the widespread usage of different herbal treatments at that very early time. According to legend, China has utilized *Cannabis* plant (*C. sativa* L.) for more than 8000 years [41].

The opium produced from the poppy (*Papaver somniferum* L.), which was first grown in Mesopotamia around 5400 years ago [19], has been used for medical purposes continuously ever since. Two fragments of the birch fungus *Piptoporus betulinus* (Bull.) Karst was found inside the mummified human body known as the "Iceman" that was found in the Italian Alps in 1991. According to scientists, this 5300-year-old person may have been utilizing the fungus as a medicine to cure intestinal parasites [24]. It is without dispute that herbal therapy has a long history.

2.3 Chinese Medicine

Chinese people have employed Traditional Chinese Medicine since ancient times. While components from animals and minerals have been employed, plants are the main source of cures. About 500 of the more than 12,000 items used by traditional healers are regularly used [103]. Botanical products are only used after being processed, which could include stir-frying or soaking in vinegar or wine, for example. In clinical practice, a complex and frequently individualized treatment may be prescribed after a conventional diagnosis. In China, conventional Chinese medicine is still widely practiced. Traditional medicine is regularly used by more than 50% of people, with rural areas having the highest rates of use. In China, there are over 5000 traditional medicines that makeup about one-fifth of the country's pharmaceutical sector [103]. Numerous herbal treatments made their way from China to the Japanese traditional medical systems. In the ninth century, the earliest pharmacopoeia of Japanese traditional medicine included a classification of native Japanese herbs [173].

2.4 Arab Herbalists

It is generally known that in the Middle Ages, Arab herbalists, pharmacologists, chemists, and doctors modified and enhanced classical Hippocratic-Greek medical knowledge. In addition, the vast majority of Arabs are Muslims, and Islamic philosophy and Arabic culture are intimately intertwined. As a result, Arabic medicine (AM), Arabic materia medica (AMM), and Arabic herbal medicine (AHM) are also known as Greco-Arab or Islamic medicine. Arabs in the Baghdad area were the first people in history to distinguish between medicine and pharmaceutical science in the eighth century. The Arab world is where the first pharmacies were opened (Baghdad, 754 CE). Certain medication formulations may still be found in pharmacopoeias today, and the forms utilized at the time are still used in treatment [116]. Mesopotamia produced the oldest records of herbs, which were recorded on clay tablets and written in cuneiform (dating back to 2600 BCE). The Ebers Papyrus, which dates back to 1500 BCE, is the most famous Egyptian medical record. It lists 700 herbal remedies (mostly derived from plants) and their dosage forms, including gargles, snuffs, poultices, infusions, pills, and ointments, as well as their carriers, including beer, milk, wine, and honey [171].

AHM has been practicing the use of organic and inorganic natural medicines for the prevention and cure of illnesses since the eighth century, including camel urine [123]. It is interesting to note that camel urine therapy had a significant cytotoxic impact on mouse bone marrow cells, according to pharmacological investigations [115]. Just 200–250 plant species are still used in traditional Arab medicine to treat different ailments, despite the Middle East being home to more than 2600 plant species, more than 700 of which are known for their usage as medical herbs or botanical insecticides [6].

From Alexandria to Sallum in Egypt, the western Mediterranean coastal area has 230 species of plants from 48 families; 89% of them were useful for medicine, 62% were common, around 24.9% were unusual, and 15% were rare [14]. The Mediterranean area and/or the worldwide market still sell or trades 236 plant species, 30 animal species, 29 organic compounds, and 9 materials of other or mixed sources that are still used to cure human ailments [6]. Around 250–290 plant species are still in use in the Mediterranean area, according to ethnopharmacologists' surveys of the region's plant species [101, 172]. A total of 129 plant species are used in AM in Israel to treat a range of illnesses. About 40 species of these plants are used to cure skin conditions, 27 species for digestive issues, 22 species for liver issues, 16 species for respiratory conditions and coughing, 22 species for different types of cancer, and 9 species for weight reduction and cholesterol lowering [15]. Yet throughout the Arab Empire, Islamic doctors employed more than 1400 different types of herbal remedies (632–1258). The late nineteenth and early twentieth centuries, up to the implementation of the Food and Drugs Act of 1906, were likely the height of herbal medicine use in the USA. Hundreds of patent herbal preparations, many of which included a significant amount of alcohol, were easily accessible on the US market before this regulation. Some of these, such as Swift's Syphilitic Specific, later shortened to SSS Tonic [191], and Lydia E. Pinkham's Vegetable Compound [192], continued to be sold and are still well remembered by many people today. Yet, the majority of these items and the absurd advertising that supported them were put out of business by the 1906 Act.

2.5 Aztec Medicine

This is a system of herbal medicine that evolved within Aztec societies where human health is managed holistically using spiritual and material bodies (plants and animal products and by-products). It began among the Nahuatl-speaking indigenous people of Mexico. Today, Mexico is the nation with the second-highest number of registered medicinal plants after China and has a long history of using medicinal plants [7, 50]. [36]. Indigenous traditional medicine in Mesoamerican societies began to emerge about 1500 B.C., beginning with the Olmec, the mother culture, and continuing with the Toltecs, Teotihuacans, and Mayans [170]. This came to an end, however, with the collapse and invasion of the Aztec empire in 1521 by Spanish colonizers, who lost a great deal of knowledge about the use of plants as medicines. After the conquest, however, it was possible to reconstruct the Aztecs' medical history. The *de la Cruz-Badiano Codex* (Código de la Cruz-Badiano), which was produced in 1552 by Nahuatl native Martin de la Cruz and translated by Juan Badiano, is the earliest book on medicinal plants used by Native Americans on the American continent [68]. Religion, astronomy, divination, and the polarity of cold and warm served as the foundation for Aztec medical doctrine. The estimated number of Indigenous people in Mexico now is 25.5 million (or 21.5%) [69]. The majority of herbal medicine used to treat common ailments is used by these Indigenous groups [29].

2.6 Indigenous or Native American Societies

Presently, 4.9% of Canada's population, or 1.7 million people, and 1.7%, or 5.6 million people in the USA, identify as Indigenous [110, 184]. The Indigenous people who resided on the land and were assimilated into several nations in Canada before the advent of European invaders, such as the Inuit and Metis, are known as First Nations [184]. Native Canadians' traditional medical practices are in danger of disappearing since they were historically replaced by the modern medical system and lost the trust of the populace as a result of conquering. As a result, governments, medical professionals, and European Canadian missionaries gradually banned indigenous healing practices [39]. For instance, with the Indian Act of 1876, Federal Indian policies increased and codified the monitoring and control of Native Americans' lives [52, 98].

Children from these villages were taken away by force in the 1960s and put in foster care to be adopted by non-Native families in Canada. Intergenerational trauma resulted from the assumption that the parents of these children did not have enough residences and educational opportunities to care for them [39, 88]. As a result, it has been challenging for the Indigenous community to transmit their ancestors' traditional medical knowledge. Nonetheless, this persecution and cultural marginalization have been reversing in recent decades. Indigenous peoples of Canada have used their traditional knowledge of medicinal plants for thousands of years, and it has been handed down verbally down the generations. Particularly significant in this sense for Indigenous peoples like the Metis, Cree, Dene, Sekani, Innu, Ojibwa, Chippewa, Abekani, and others are the boreal forest regions of Canada [195].

According to the most recent population census, the majority of the Indigenous people in the USA are American Indians, Alaskan Natives, and Hawaiian Natives, with a combined population estimated at five million (1.5%) [194]. Before the coming of European colonizers, Native Americans in the USA engaged in health practices that, during therapeutic sessions supported by goods like herbs, emphasized the connections between individuals (family and social groups) and the environment [215]. The loss of lands and other resources experienced by the American Indians and Alaskan Natives in particular during colonialism influenced their way of life, particularly the repression of their spiritual and healing practices, which is still happening today [215]. With the loss of their rights came the relocation of American Indians and Alaskan natives to reservations, separation from their holy places and medically significant flora and fauna. Congress was given extensive constitutional authority to negotiate with these groups in 1787. The American Indian Religious Freedom Act was enacted by the US Congress in 1978. However, many American Indians and Alaskan Natives are not recognized by the federal government [215].

Before the coming of the European conquistadors, traditional Native American medicine was used for generations. Yet these techniques were outlawed, and this information was given a lower value. Because of this, little is known about how these activities affect human health, and it is challenging to interpret both archaeological and human remains. The 1990 Native American Graves Protection and Repatriation Act, in particular, restricts research on the latter [193]. However, the contemporary tribal tribes are attempting to revive these historical rituals [215]. In the USA, the study of traditional indigenous medicine made from wild plants dates back more than a century [156]. The mesophytic woods of Appalachia are thought to include 1100 plant species of therapeutic use [25]. Eastern Tennessee, Western North Carolina, and Southeastern Virginia make up these woods; this area has a wide range of temperatures that favor the development of a wide diversity of plants. Although, traditional medicine and the use of medicinal plants can be traced back to Mesopotamia and Egypt, the foundation of European medicine was established by physicians and philosophers during Greek antiquity and the time of the Roman Empire, who began establishing a written consensus about what was considered effective medical knowledge. The oldest known fragment of a Greek herbal is preserved in the ninth book of Theophrastus of Eresos' (c. 370–287 BC) *Enquiry into Plants*, which is about the juices and therapeutic characteristics of plants [65]. Hippocrates of Kos (c. 460–370 BC), Galen (129–c. 199/200 or 216–217 AD), and Pedanios Dioscorides (first century AD) were the most illustrious and significant ancient writers who successfully merged botanical and medicinal knowledge. The most significant herbals ever published are considered to be Dioscorides' *De Materia Medica* and Galen's first alphabetical compilation of simple medications (*De simplicium medicamentorum facultatibus libri XI*). These writings had an impact on Mediterranean and European medicinal plant usage up to the eighteenth century via the constant copying and distribution of their content [11, 196].

Dioscorides discussed the therapeutic use of almost 900 herbal species, 600 medicinal plant species, 35 animals, and 90 mineral remedies [166]. A century later, Galen recorded roughly 850 simple medicines, most of which were similar to those named by Dioscorides but had far fewer medical use [100]. Each plant taxon was frequently referred to by a "code" made up of a list of the vernacular names and was known by various languages. This rigorous cross-referencing of names and uses served as a protocol for academic rigor to ensure accurate plant identification between regions, allowing herbal texts to be applicable in a wider geographical and cultural context and fostering the growth and consolidation of scientific knowledge.

2.7 Greek-Roman-European Herbalism

Greek herbals have a rather well-documented history, including their mutual effect and phylogeny. Lost copies may even be found by looking for missing connections [181]. Dioscorides, for example, cites and alludes to a variety of various writers and books, some of which have survived (such as works attributed to Theophrastus and Hippocrates) and others of which are now lost or have only partial copies left. Translations into Syriac served as a crucial intermediary step that permitted the transfer of Greek and Byzantine medical knowledge into Arabic and to the medieval Islamic world [169]. In addition to preserving classical medical knowledge, the Arab culture advanced it and made it possible for it to be transmitted back to the Occident via al-Andalus and the School of Salerno (about 1000–1300 AD) (711–1492; [196]). The analysis of the so-called Syriac Galen Palimpsest is likely to provide new and important insights on the transfer of Greco-Roman medical knowledge to the Arabic world. The earliest copy of Galen's writings on herbal remedies is now this manuscript, which is significant because it offers other readings from the more recent Greek versions that may be used to spot interpolations and other textual interpretations [18].

The middle and Northern European herbals were also affected by the traditional Mediterranean materia medica in terms of their organization, literary style, and substance. Back in the Medieval Ages according to monastic law, Benedictine monks were required to maintain therapeutic herb gardens, such as those at the abbeys at Montecassino, Italy, and St. Gall, Switzerland [190]. Classic Greco-Roman herbals and medicinal books underwent rigorous examination, commentary, and translation into contemporary languages throughout the Renaissance, garnering significant print runs. Renaissance herbals, however, also included the consensus of northern and central European medical folklore and were accompanied by woodcut drawings enforcing the commentators' botanical identifications.

The *Gart der Gesundheit* is recognized as the first thorough German herbal, authored by Johann Wonnecke von Kaub (ca. 1430–1504), physician to the city of Frankfurt and illustrated by Dutch artist Erhard Reuwich (1445–1505). [121]. The 435 monographs in the *Gart der Gesundheit* are based on texts from the Mediterranean region, including Pliny's *Natural History* from the first century AD, *The Canon of Medicine* by Avicenna (Ibn Sina, ca. 980–1037), the *Pseudo-Serapion* (Aggregator) by Ibn Wafid from the eleventh century in Toledo, and the *Circa Instans* by Matthaeus Platearius from the twelfth century [114].

The printing press' development led to a surge in the creation of European herbals and a race among writers, who weren't always free of nationalist emotions. The documentation of traditional folk knowledge on central and northern European materia medica was combined with the translation, commentary, and integration of ancient Greco-Roman knowledge by Peter Schoffer (1425–1503), Jan Stanko (1430–1493), Jean Ruelle (1474–1537), Otto Brunfels (1488–1534), Adam Lonitzer (1528–1586), Leonhard Fuchs (1501–1566), Hieronymus Bock (1498–1554), and William Turner (1508–1568). Nevertheless, a thorough examination of the problems of which plant species and applications were first recorded and in which herbal and how much materials were used is still absent.

The Greco-Roman and Arabian medical treatises were a major source of inspiration for the first formal pharmacopoeias. In addition to Hippocrates, Pliny, Dioscorides, and Galen, Matthaeus Platearius (twelfth century), Rhazes (865–925), and Avicenna were all significant figures (ca. 980–1037; [196]). Three texts written after 1000 AD at the School of Salerno, namely, the Antidotarium Nicolai (ca. 1100), the Antidotarium Nicolai Myrepsi (thirteenth century), and the Antidotarium or Grabadin of Pseudo-Mesue (ca. thirteenth century), are considered to be the forerunners of the official city pharmacopoeias due to the format and presentation used [196]. Constantinus Africanus (eleventh century), a Carthage herbal trader who collected Arabic medical works in North Africa and translated them into Latin, contributed a significant amount to the corpus of work created at the School of Salerno [121].

Roman era records of early imports of spices and herbal medicines from the Orient well-documented both the New World and Southeast Asia, showing the significance of exotic goods for European pharmacopoeias [198]. Prior to the creation of the European Pharmacopoeia, there were several factors that prevented attempts to synchronize pharmacopoeias, official or not, including the notion that locally sourced medicines would have a disproportionately high level of positive effects and the economic case for supporting locally produced goods [196]. The quest for effective treatments, often known as the trial and error method, during the outbreak of new epidemics (such as syphilis) and the testing of imported “strange” plant species supplied the laboratory for experimentation at the same time. After the Conquest, when Christopher Columbus and his ship returned from the Caribbean with their cargo, the syphilis pandemic was transferred from the Americas to Europe. The core wood of *Guaiacum officinale* L., a remedy used by the native people of the West Indies to treat syphilis, was imported to Europe and advertised against the disease, but later proved to be ineffective. This was because it was believed that the origin of specific diseases would be connected with the source of effective medicines [111]. Matthioli was the first to identify mercury’s particular usefulness against syphilis, even though Arabian pharmacists had brought the substance to Europe as a therapy for skin conditions [111].

The Swiss physician Paracelsus (1493–1541) attempted to depart from the traditional medical theories of the time, particularly those of Galen and Avicenna, and promoted high hygienic standards for surgery. Paracelsus is best known for developing the fundamental toxicology principle that “the dose makes the poison” [111]. Yet even Paracelsus, an alchemist, was susceptible to esoteric and symbolic thinking. The “doctrine of signatures” was put out by Paracelsus in De natura rerum in 1537 as a holistic and harmonic theory that could foretell the medicinal properties of plants based on characteristics like form, color, smell, and taste [121]. While the theory of signatures’ fundamental premise is founded in folk medical practices all over the globe, Paracelsus systematized it in conceptual contrast to Galen’s humoral pathology [121]. The German physician Samuel Hahnemann (1755–1843) developed homoeopathy, which still adheres to the idea of signatures today, although conventional herbal therapy in Europe is likely losing ground in this regard.

Since there were fewer early herbals and because they had more time to exert their causal influence on the spread of medical knowledge and popular herbal knowledge, the earlier herbals were generally more important. Due to their large print runs, which are estimated to have exceeded 30,000 for the older editions of *I Discorsi* alone, others, like Matthioli's Renaissance commentary on Dioscorides' Materia Medica (*I Discorsi*), originally published in 1544, also had a significant influence [99]. The work of Dioscorides was included into Matthioli's herbal, which also included 600 new medicinal species. It was also published in Italian and translated into more vernacular languages, including French, German, Czech, and Arabic, with a total of almost 60 distinct editions (Barberi, 1967–1970). *I Discorsi* was founded on Matthioli's experience as a medical doctor and botanist who was acquainted with the Mediterranean flora, making Matthioli's translation simple to understand [185].

2.8 Alkebu-Lan or African Herbalism

Alkebu-lan medicine may be the oldest form of herbal medicine practice and system from which every other system evolved considering the history and origin of humans. The lack of scripts and high secrecy associated with the practice in most parts of Africa makes it difficult to trace most of these practices, but remnants still exist to date in the form of African traditional medicine (ATM) on which a large proportion of the population depends on for their primary health care because it is cheap, easily accessible, and highly relatable [132, 134, 138, 139, 147, 152]. In large part, the system is connected to how plants are used both as food and medicine and their conservation [128–131, 133, 135–137, 140–142, 149–151]. According to Ozioma and Chimwe [153], ATM involves spiritualism, divination, and herbalism and permeates the culture, religious beliefs, attitudes, knowledge, and understanding systems of African communities. Practices include the use of materials (plants and or animal parts) with incantations, sacrifice, and exorcisms. The system was challenged and almost pushed out by the European and Arab colonizers who seek to increase the spread of their religion and modern medicine practice while the locals where challenged with economic (poverty) and other developmental issues. Enslaved Africans who were taken to different parts of the world may have contributed to the growth and development of the practice in those parts. Although enslaved they maintained small plots containing medicinal plants that are used in the preparation of herbal tinctures, decoctions, teas, incense, etc. for the treatment and management of diverse ailments. According to Okaiyeto and Oguntibeju [143], some factors contributing to the preservation of ATM include:

1. Accessibility and cost-effectiveness.
2. The perception that it is natural and safe.
3. Connection to their gods, dead relatives, and nature.
4. Superior efficacy to modern medicine.

5. Ability to self-medicate.
6. High levels of confidentiality associated with ATM.
7. Fear of erroneous diagnosis in the hand of modern medicine practitioners.
8. Long waiting periods are often associated with modern medicine in Africa.
9. Advertisement of herbal products, practices, and practitioners.

3 Utilization of Herbal Medicine

Globally, the interest and use of medicinal herbs have seen exponential growth with an estimated market value of USD 152 billion and a forecast of USD 350 billion by 2030 [47]. In Europe, Germany has the largest market for herbal medications with medical claims and those that are typically prescribed in pharmacies [62]. According to German manufacturer prices, the market costs €1.33 billion annually, which is proportionate to 20.7% of the entire European market. Other significant nations in conformity with the provision and sales of herbal medicines include Spain (6.3%), Poland (7.2%), Italy (17.1%), Russia (9.2%), and France (13.0%) [62]. A survey by Rashrash et al. [164] revealed that more than a third of adults in the USA utilize alternative medicine for the management of their health. The most frequently utilized alternative medicine, except for vitamins and minerals, was herbal products [16]. In most developed countries, over-the-counter sales of herbal medicine products can take in the form of plant oils, herbal supplements, or teas (such as chamomile, ginger tea, peppermint tea, green tea, etc.) sold in drug stores alongside conventional medicine. Traditional medical practices vary considerably from one nation to another and area to region due to influences from such things as culture, history, philosophy, and individual attitudes. Usually, their theory and practical application differ markedly from those of mainstream medicine [210].

Traditional medicine has been utilized in Nigeria to treat a variety of illnesses. In a study by Abubakar et al. [3], it was found that 85% of the respondents used traditional medicine to treat a variety of health issues, including diabetes, typhoid fever, pneumonia, pile, cancer, fever, measles, diarrhea, and cough. Accessibility, affordability, perceived safety, and therapeutic recommendation potential for treating numerous ailments are believed to be the major driving factors for the surge in the utilization of herbal medicine [124]. As such, the upkeep of human health has become the primary focus of the widespread usage of herbal medicine [4, 5, 70]. Past studies have revealed that Nigerians of various socioeconomic status engage in the use of herbal medicine [45]. Botanical treatments persisted in the form of tinctures, fluid extracts, and concentrated extracts. One might argue that such galenical medicines served as the cornerstones of period medicine. Products like the fluid extract of Ergot U.S.P. and the tincture of *Digitalis* U.S.P. were quite popular. With the advent of sulfanilamide in the middle of the 1930s, the first suppression of plant treatments started. The race was on as synthetic organic chemists created hundreds of novel compounds with potential therapeutic qualities in response to this new German antibacterial medication. Old plant medications were quickly superseded by new, often very helpful, synthetic pharmaceuticals for two reasons [167]. They could be marketed at a premium price to pay the expenses of the research needed in generating them while still allowing the maker to make a sizable profit since they were unique chemical entities covered by patent protection. Also, since they were unique chemical entities, it was simple to standardize their action and achieve predictable potency. In contrast, many of the traditional botanicals were likewise efficient but were abandoned since they could not be patented and did not guarantee profit margins. They were challenging to standardize since they often ascribed their action to many constituents, many of which remained unknown. Almost impossible was action uniformity. The issue is typified by Digitalis (*Digitalis purpurea*). The herb is prized as a treatment for congestive heart failure because it contains both short-acting and long-acting glycosides with rapid and slow onset, making it basically superior to any single glycoside isolated from it. However, it was difficult to accurately standardize the leaf in any way. Researchers eventually gave up after trying a variety of animals with little success, including guinea pigs, goldfish, chick hearts, frogs, cats, water fleas, and pigeons. As a result, digitalis leaf is no longer used in America. Eventually, almost all herbal remedies vanished from pharmacy shelves, and by the 1960s, American medications, unlike those used in the majority of other nations, were almost entirely synthetic. According to local custom, herbal remedies are utilized in several EU nations. For instance, according to the Allensbach Study from 2017, 70% of Germans have tried "natural medicines," with herbal treatments being the most popular kind. Without a prescription, by mail order, or in pharmacies, herbal medications worth 1.36 billion market data were sold in Germany alone in 2015 [67]. In addition to properly approved medications, other goods have been registered as traditional medicines due to their extensive history of usage. This presents some significant issues for ethnopharmacology, particularly in terms of how to establish a solid evidence foundation for the use of such items and define what exactly qualifies as a tradition of usage as a medicine. In the 1970s and 1980s, sophisticated European nations, particularly Germany, started to publish scientific and clinical papers demonstrating the medicinal and financial value of herbal treatments, which had never been completely abandoned in that region [175]. The oldest and maybe most diverse treatment approach is African Traditional Medicine. With its great biological variety and cultural diversity, which is reflected in regional variations in healing methods, Africa is regarded as the birthplace of humanity [10, 56]. Sadly, the systems of medications are still not well documented. Traditional African Medicine encompasses the body and mind holistically in all of its manifestations. Before administering medications, especially medicinal plants to address the symptoms, the traditional healer often determines the psychological cause of a disease and treats it [57].

The main natural resources ever employed by humanity for maintaining preventive, curative, and rehabilitative health in Africa include plants, minerals, and animals. These materials have been employed by traditional healers for more than 10,000 years, much like any other continent. In traditional African medicine, herbalists, midwives, and diviners are all involved. The diagnosis of illnesses, which in certain circumstances are said to be brought on by ancestor spirits and other forces, is the responsibility of diviners. Native plants are often used by traditional midwives to facilitate delivery. A herb trading market in Durban reportedly draws between 700,000 and 900,000 merchants annually from South Africa, Zimbabwe, and Mozambique since herbalists are so well-liked on the continent. There are smaller herb markets in almost every town [58].

4 Herbal Medicine Applications and Techniques

Plants contain a wide range of compounds, including minerals (molybdenum, potassium, calcium, sodium, zinc, magnesium, and so on) and phytonutrients which include sugars (cellulose, starch, rhamnose, sucrose, ribose, fructose, maltose, etc.), carotenoids (flavonoids, lignans, lutein, carotene, plant sterols, isothiocyanates, lycopene, and others), and polyphenols (cinnamic acid, vanillic acid, curcumin, ellagic acid, tannins, etc.) all of which play integral roles in the prevention of diseases and health management [59, 86, 95]. A majority of these compounds possess antioxidant properties, enhance immunity, prevent cancer, suppress inflammation, protect the brain, and effectively reduce the progression of aging [66, 95, 182, 199]. Plant components are used directly as chemotherapeutics; thus, ethnobotanicals are crucial in pharmacognosy research, drug discovery, and development. They can also be used as building blocks in the design and production of drugs or serve as models for pharmacodynamic substances [104]. Morphine (named after Morpheus – the Greek god of dreams) was the first physiologically effective pure compound, isolated from Papaver somniferum (opium) by Friedrich Serturner at the start of the nineteenth century [13]. This stimulated an avalanche of research on medicinal plants and led to the discovery of numerous lifesaving bioactive compounds of natural origin. Some known examples include artemisinin (*Artemisia annua*), aspirin (*Salix* spp.), atropine (*Atropa belladonna*), cannabinoids (*Cannabis sativa*), cocaine (*Erythroxylum coca*), codeine (*Papaver somniferum*), digoxin (*Digitalis purpurea*), galanthamine (*Galanthus nivalis*), quinine (*Cinchona officinalis*), and reserpine (*Rauwolfia* spp.), among others [13]. This epoch of drug discovery was further broadened to include microorganisms by Fleming's discovery of penicillin which established the scientific and economic platform for modern medicine and the biopharmaceutical industry [38].

According to recent aging studies, bioactive compounds have exhibited enormous promise for managing even the most severe ailments and may one day replace conventional medications [197]. Nevertheless, the effects of many plant products on humans are largely a mystery, despite the multitudes of research in this area. The best active ingredients and doses can be chosen to produce the optimal beneficial effects from herbal medicines by carefully analyzing the mechanisms by which they affect the aging process. It is better to examine in vivo the efficacy of biologically active substances and plant extracts with geroprotective characteristics. The animal model systems employed for this purpose include but are not limited to zebra fish (*Danio rerio*), mice (*Mus musculus*), fruit fly (Drosophila melanogaster), nematode

(*Caenorhabditis elegans*), and rats (Rattus norvegicus) [64, 118]. These models make it easier to thoroughly research how newly created medications affect the aging process. However, the model organism *C. elegans* is gaining increasing popularity in these studies because of its numerous advantages. They include a short life span; easy lab maintenance; transparent body for real-time imaging; advanced genetic, genomic, and molecular tools and manipulations; high genetic homology with humans; etc. [189]. Havermann et al. [61] revealed that the bioactive compound baicalein extended life span and improved stress resistance via the activation of Keap-1/Nrf-2 signaling pathway using C. elegans. In addition, luteolin and chrysin demonstrated life span extension via the activation of AMPK pathway in both *D. melanogaster* and *C. elegans* [97]. Rosmarinic acid, a natural polyphenol, has been shown to increase the average life span of *C. elegans* by upregulating the S pathway via *ins-18* and *daf-16*, the MAPK pathway via *skn-1* and *sek-1*, and stress resistance and antioxidant genes like *ctl-1*, *sod-3*, and *sod-5* [106]. Curcumin has also been reported to increase life span in *C. elegans*, which is dependent on the functions of *age-1*, *skn-1*, *sir-2.1*, *sek-1*, *unc-43*, *osr-1*, and *mek-1*, which are related to the S, MAPK, and JNK signaling pathways [105].

Furthermore, natural products remain the fulcrum of more than 60% of cancer therapeutics that are available or undergoing investigation. Over 70% of the globally approved 177 anticancer drugs are derivatives of natural products, and several of them have been optimized using combinatorial chemistry. Camptothecin (*Camptotheca acuminata*), a precursor for irinotecan and topotecan; combretastatin derived from *Combretum erythrophyllum*; paclitaxel, isolated from *Taxus brevifolia*; vincristine from *Catharanthus roseus*; noscapine from *Papaver somniferum*; and flavopiridol, a structural isomer of rohitukine derived from *Dysoxylum binectariferum* are some examples of plant-derived medications that have been employed for cancer therapeutics [31, 32, 158, 178]. In addition, alpinumi isoflavone and 4′-methoxylicoflavanone isolated from the stem bark of *Erythrina suberosa* exhibited cytotoxicity against human leukemia (HL-60 cells) through the suppression of the membrane potential in the mitochondria and activation of apoptotic proteins [96]. The chemoprotective and anticancer activity of curcumin has also been well established both in vivo and in vitro. Some of its known mechanisms include apoptotic stimulation via the inhibition of cyclin D1, cyclo-oxygenase-2, and other relevant NFκB target genes [188]; autophagy [27], mitotic arrest [55], and antioxidant and anti-inflammatory activities [48].

In addition, the inherent capacity of herbal medicine to fight COVID-19 became an important research focus during the global pandemic. Due to their potent suppression of SARS-CoV-2, traditional Chinese medications garnered a lot of interest. For instance, Qingfei Paidu decoction demonstrated an outstanding clinical efficacy of >90% in treating COVID-19 patients at all phases [119, 163, 201]. Shuanghuanglian, also popular in TCM, suppresses SARS-CoV-2 Mpro replication in a dose-dependent manner [187]. Natural products such as graveospene A, deguelin, and erianin have been utilized mono-therapeutically for the management of lung cancer in vitro, while baicalein, resveratrol, and ginkgolic acid were employed during the fight against SARS-CoV-2 [217]. Moreover, the combination of some Food and Drug Administration (FDA)-approved drugs with biologically active compounds has been reported to mitigate the pernicious effect of SARS-CoV-2 [217]. For instance, the combination of nelfinavir and cepharanthine, remdesivir and linoleic acid, cisplatin, and curcumin have all been reported [217]. It is noteworthy that more than 40% of pharmaceuticals approved by the FDA have come from natural sources or their derivatives [157].

Possibly, due to the phytochemical content of plants, many of them have been reported to be used as an alternative agent for the treatment of several diseases. Hence, they can be used to treat diseases caused by microbes possibly due to their antimicrobial potentials [42–44, 71–73, 77–83, 89–93]. It can be used to control vectors or insects such as mosquitoes [17, 74–76, 176, 177, 218]. They can be used as preservatives. Other diseases and conditions that can be managed with plants include memory loss, cardiovascular diseases, arthritis, osteoarthritis, digestive, respiratory, reproductive, skin, neurological diseases, diabetes, cancer, hypertension, gastrointestinal, and conditions such as pregnancy, etc. Two main factors that support the continued interest in traditional medicine in the African healthcare system include affordability and accessibility. Contemporary medical care is often too expensive, or not available. Secondly, although having an almost worldwide distribution, certain diseases like malaria and HIV/AIDS, disproportionately affect Africans more, and the reliability of traditional medicine makes them try it out [126, 127]. Medicinal plants are often the community's primary readily available source of healthcare in many regions of Africa. Also, they are often the patients' first choice. For the vast majority of these individuals, traditional healers provide information, counseling, and therapy to patients and their families in a personal way while also being aware of their patient's surroundings [10, 56, 58]. Africa is endowed with abundant biodiversity [144, 145, 161, 162, 174]; it is thought to have between 40 and 45,000 plant species with the potential to become developed, of which 5000 species are utilized medicinally. This is not unexpected given that Africa has a tropical and subtropical climate and that plants naturally collect significant secondary metabolites as a method of surviving in a harsh environment [109].

Written records of herbal medicine go back 5000 years in Egypt. The Edwin Smith, Ebers, and Kahun papyri include a wealth of information on Ancient Egyptian medicine. The Edwin Smith Papyrus and the Ebers Papyrus, both published in 1930 by Breathed and Bryan, respectively, are from the seventeenth and sixteenth centuries BCE. It is thought that these writings came from previous sources. These include spells and recipes for a wide range of illnesses and symptoms. They go through illness diagnosis and provide anatomical facts. They go into great depth into the anatomy, physiology, and medicine of the Ancient Egyptians. A gynecological literature called the Kahun Papyrus [51] discusses issues such the reproductive system, conception, pregnancy testing, childbirth, and contraception. Crocodile dung, honey, and sour milk are some of the substances that are recommended for contraception [168]. Pygeum (*Prunus africana*), a traditional African remedy for mild-to-moderate benign *prostatic hyperplasia*, has gained widespread acceptance outside of Africa. It has been offered in Europe since the 1970s. Pygeum barks are gathered annually in Madagascar and Cameroon in quantities of 600 metric tons and 2000 metric tons, respectively. The bark is brewed into tea in Africa [125].

It is offered everywhere in the globe in the forms of powders, tinctures, and tablets; often, it is mixed with other herbs thought to be beneficial for prostate issues. Customers experience less inflammation and cholesterol buildup, as well as easier urination. The significance of this therapeutic method in Africa may be shown by comparing the numbers of traditional healers and physicians. There is one traditional healer for every 700–1200 individuals in the Venda region of South Africa, compared to 1 doctor for every 17,400 people. For every 110 individuals, Swaziland has one traditional healer. The percentage is the same in Benin City, Nigeria. In urban Kenya, there is 1 traditional healer for every 833 people.

The chiefs of state and government of the former Organization of African Unity (OAU) in Africa acknowledged that 85% of the continent's people rely on it for their healthcare requirements. The OAU proclaimed 2001 to be the Decade of Traditional Medicine. Following this historic pledge by African leaders, the Plan of Action and implementation mechanism that were endorsed by the AU summit heads of state and government in Maputo in 2003 were adopted by the First AU Session of the Conference of African Ministers of Health (CAMH1), held in April 2003 in Tripoli, Libya. The Plan of Action's primary goal is for all Member States to recognize, embrace, advance, and institutionalize traditional medicine within the region's public healthcare system by 2010. [58]. Additionally, the Maputo Declaration on Malaria, HIV/AIDS and Other Related Infectious Diseases (ORID) of July 2003 resolved to keep supporting the Plan of Action for the AU Decade of African Traditional Medicine (2001–2010), particularly research in the area of treatment for HIV/AIDS, tuberculosis (TB), malaria, and ORID. The Lusaka Summit proclaimed the years 2001–2010 to be the OAU Decade for African Traditional Medicine in July of the same year. The 11 priority areas, which have been developed into strategic activities, are institutional arrangements, information, education, and communication, resource mobilization, research and training, cultivation and conservation of medicinal plants, protection of traditional medical knowledge, local production of standardized African traditional medicines (SATMs), partnerships, and evaluation. The African Union (AU) Member States have been carrying out the plan of action of the AU Decade of African Traditional Medicine and the priority interventions of the WHO regional strategy since 2001, namely, policy formulation, capacity building, research promotion, development of local production, including cultivation of medicinal plants, and protection of traditional medical knowledge and intellectual property rights [168].

5 Trends in Herbal Medicine

Now, several nations throughout the globe are still reacting to the Beijing statement from November 8, 2008. The World Health Organization assembly urged nations to take charge of their citizens' health by creating national policies, rules, and standards that would guarantee the proper, safe, and efficient use of traditional medicine [212]. Since traditional medicine has helped millions of people throughout the globe get cheap treatment, it has shown the ability to meet the WHO's goal for universal healthcare [26]. Studies demonstrate that patients who see a general practitioner with extra training in alternative medicine have lower healthcare expenses and death rates than those who do not support this claim [94]. Less use of prescription medications and hospital stays was said to have reduced costs. Hence, every government in the world has made the significance of complementary and alternative medicine (CAM), which mostly employs plant items as pharmaceuticals, a top priority. These medications are prescribed over the counter, utilized as over-the-counter home treatments, and serve as pharmaceutical industry raw ingredients. They make up a significant share of the global medication industry and help millions of people throughout the globe get basic healthcare. This section will examine the use, regulation, integration, and quality control trends for herbal medicine on a worldwide scale. Almost 100 million individuals in Europe use traditional medicine-related goods and procedures, with 5% utilizing it as an alternative to mainstream treatment and the same amount as a supplement to it [148]. According to reports from the UK, 40% of doctors reportedly recommend patients to alternative healthcare providers. Complementary and Alternative Medicine (CAM) is used by the populations of France, Canada, and Australia at rates of 49, 76, and 46%, respectively. In Asia, China is reported to have produced 83.1 billion US dollars worth of Chinese herbal medicine in 2012, while the Republic of Korea increased its yearly spending on traditional medicines from 4.4 billion US dollars in 2004 to 7.4 billion US dollars in 2009 [148].

Regarding regulation, conventional Western medicine is completely controlled by government agencies, as is the use of Traditional Chinese Medicine. Almost 1146 species had been listed by 2005 in the well-established Chinese Pharmacopoeia, which was created to assure the quality of Chinese material medicine. These species may be examined using over 479 different HPLC techniques, 45 TLC methods, and 47 GC methods [33, 34]. The Ministry of Standardization and Methodology in Japan has accepted and standardized over 148 formulas from various manufacturers [60]. In addition, over 210 formulations are available over the counter and are utilized in medical institutions. In Hong Kong, traditional healers are consulted by around 60% of the population. For instance, local researchers in Singapore employ software to examine multi-herb mixtures [203]. The usage of straightforward preparations (cut and dried) and those in other dosage forms is regulated by law (an example is existing statutes in Singapore). Only items that adhere to the necessary safety and quality criteria may be listed and authorized for production, importation, supply, or sale. In the USA, it was predicted that 14.8 billion dollars were spent directly on natural goods in 2008. According to further South American figures, traditional medicines are used by 71% and 48% of the populations of Chile and Colombia, respectively. In several of these nations, medical schools educate about traditional remedies. To assure the identification, quality, purity, potency, and consistency of herbal medications, the US FDA suggests a variety of tests. Chemical assays, distinctive markers, and chromatographic fingerprints are used in many testing for drug substances and products. Raw material process controls and drug substance validation are also conducted. Moreover, in the USA, the creation of herbal monographs has benefited greatly from microscopy [9].

Several African nations have not yet included these types of medications in their primary healthcare systems. According to Ghana, traditional medicine has been incorporated into South Africa's and Nigeria's current healthcare systems [209]. Others have partly incorporated it, such as Tanzania, Ethiopia, and Rwanda. More nations, such as Uganda, Chad, and Gabon, are creating integration policies. According to the World Health Organization, traditional medicines are the primary source of healthcare for 70–90% of Africa's rural population [210]. In a 10-year assessment, the World Health Organization found that the majority of African communities continue to rely on herbal therapy [213]. According to research by Chatora et al. [28], the majority of basic healthcare on the African continent is still provided by traditional medical practices and products. To substantiate Chatora's research report from 2003, Abdullahi [2] references the increased usage of traditional medicines in Africa despite the problems it faces. This indicates that, despite the changing circumstances, the need for herbal treatments has grown over time due to the growing population. The growth in chronic and noncommunicable illnesses, as well as their availability and cost, have all been linked to an increase in the use of traditional medicine, particularly herbal remedies, across the world [26, 102]. One reason for the widespread usage, for instance, is that middle- and low-income nations in Africa lack access to contemporary pharmaceuticals. According to a survey conducted in 36 low- and middle-income countries by Cameron et al. [23], a significant portion of the population cannot afford traditional medications. The evidence from nine African nations may support this.

The World Health Organization has created a traditional medicine plan for the years 2014–2023 to improve the integration of herbal medicines into member nations' primary healthcare systems. The main objectives of the approach are to assess, control, incorporate, and maximize the potential of traditional medicine for people's health and welfare [214]. By 2023, the plan will have identified some of the problems harming traditional medicines and strategies to work with the relevant member states and other stakeholders to resolve them. Its continuous use, expanding economic significance on a worldwide scale, advancements in research and development, intellectual property rights, and integration with healthcare systems are among the problems [214]. Evaluation of both safety and efficacy, quality control, regulatory and safety monitoring, education, and training of health authorities and control agencies are some of the areas in which research is required [211]. Australia is an island continent that has been inhabited by Aboriginal people for thousands of years. The many ecofloristic zones, including wet tropics, savannahs, evergreen forests, shrublands, grasslands, and wetlands, have taught over 500 different clan groupings or countries to coexist peacefully [87, 117]. While there are many distinct tribal groups in these very diverse places, what unites them all is their close and deep connection to nature and their utilization of its resources [107]. Native plants are an important part of their culture and are used to manufacture a variety of products, including food, medicine, narcotics, stimulants, adornments, ceremonial artifacts, weapons, clothing, shelter, tools, and artwork [35, 186]. Using local flora, animals, and abiotic resources over thousands of years, this native wisdom has developed [155]. Aboriginal lore serves as a means of knowledge preservation and transmission in the absence of written language. Songs, storytelling, dance, and other forms of art have been used to pass down practices and stories from one generation to the next. There are still hundreds of Aboriginal people who speak their native language and maintain the knowledge, songs, and rituals of their ancestors despite the disruption of oral traditions and lore practices by colonial contact, with English being the second or third language [113, 159]. Several Aboriginal clan groupings continue to practice Aboriginal ethnomedicine, although the amount to which it is employed varies greatly across rural and urban areas of Australia and between communities [146].

Aboriginal cultures still use numerous plants such as bush food and bush medicine, particularly in isolated locations. This makes Aboriginal plant knowledge the oldest surviving pharmacopoeia [154]. Australia has a total of 1511 plant species that have been documented as being used medicinally [154, 204]. The Aboriginal groups in the Northern Territory, New South Wales, South Australia, and Western Australia are responsible for the majority of the medicinal plant knowledge that has been documented in the literature [179]. Just a few publications on Aboriginal medicinal plants of Cape York Peninsula have been made, and there hasn't been much written on Native medicinal plants of Queensland [122, 180]. Several Native medicinal plants continue to be either unreported in the literature or unavailable to the general population [179]. Like many indigenous knowledge throughout the globe, Australian Aboriginal knowledge has been underexplored in a "Western scientific" sense and is at grave risk of disappearing entirely [84]. According to Stack [183], because the European immigrants brought their ailments and utilized their traditional treatments, Aboriginal traditional medicine did not play a role in their lives 200 years ago. Nonetheless, there exist documents that demonstrate that certain doctors and botanists collaborated with Native healers and conducted experiments with local plants for therapeutic reasons throughout the early years of European arrival. For instance, Denis Considen, the first assistant surgeon to Surgeon-General John White in the first fleet (1788–1794), claimed to have discovered indigenous medicinal plants before any other European physicians; however, his methods of discovery are unknown, and it is unclear whether he enlisted the help of indigenous informants [108]. Macpherson and Considen [108] noted the effectiveness of various indigenous medicinal plants, such as native sarsaparilla (*Smilax glyciphylla*) as an antiscorbutic and myrtle (*Eugenia australis*) and yellow gum (*Xanthorrhoea hastilis*) for dysentery [108]. In addition, local sarsaparilla was reportedly thought to be more pleasant than Jamaican or Central American varieties, according to Macpherson and Considen [108]. He said that Sydney herbalists had used it often as a trade item before 1927. Macadamia nuts were one of the plants that both the Aboriginal people and the European settlers traded regularly (*Macadamia* sp.). Notwithstanding the disruption of Native medical traditions by Europeans, Aboriginal people have made some significant contributions to global medical knowledge. For instance, Pearn [159] claims that Native childcare ethnomedicine is among "the world's oldest pediatric traditions" [159]. Native ethnomedical traditions are still a vibrant part of many Aboriginal communities today. Many groups in Australia employ various medicinal herbs depending on their local flora and habitat [146].

For instance, Southern Australia uses the fruits of the native plant *Solanum laciniatum*, whereas Eastern Australia once utilized *Solanum aviculare* (Kangaroo Apple) [183]. For joint swelling, both species were used as poultices [183].

The alkaloid solasodine, found in both of these *Solanum* species, serves as a precursor to cortisone and other steroids used in the creation of oral contraceptives (often known as "the pill") [112]. Due to their ability to biosynthesize this important phytochemical, these plants have been introduced to Russia and Eastern Europe, where they are now grown extensively [183]. A similar study was conducted on the congeneric *Duboisia myoporoides* when it was discovered that the native Australian Aboriginal narcotic plant pituri (*Duboisia hopwoodii*) was particularly useful. Aboriginals were chewing "pituri," a plant, in a manner like that of tobacco or East Indian betel, according to Joseph Banks, the first European botanist to visit the East Coast of Australia (in 1770) [46]. Ferdinand von Mueller, a botanist for the Victorian Government, recognized the plant as *Duboisia hopwoodii* a century later (in 1872) [165]. The related *Duboisia myoporoides* were discovered to generate hyoscine, now known as scopolamine, an alkaloid that is a very efficient remedy for motion sickness as reported by Von Mueller [63].

6 Research Needs in Herbal Medicine

There is a significant amount of work that needs to be done in the field of herbal medicines; however, this could be counterbalanced by the potential advantages of using these products, which are demonstrated by their consumption by significant populations, particularly in nations that are still developing. Be that as it may, it is necessary to research to ensure the identification of the specific compounds and bioactive elements contained within these herbal formulations [78, 79]. This will allow for the formulations to be purified and put to use treating specific diseases, as opposed to treating the disease with the whole plant [72, 73]. In addition, research is required to determine whether or not the use of extracted bioactive substances is preferable to the utilization of entire herbs. There is a significant need for additional studies to be conducted on the standardization procedures used to prepare herbal products. The evaluation of herbal medicine does not have a study approach that is considered adequate or generally acknowledged. It is necessary to have precise and repeatable procedures for the preparation of these medications to guarantee the distribution of the same herbal products despite differences in brand names and manufacturers. It is necessary to research to guarantee the safety of herbal goods in general. Further research is necessary to determine the processing methods, routes of administration, dosages, and compatibility with other herbal remedies or conventional treatments.

7 Conclusion

Herbal remedies have been used traditionally as medicine from the beginning of recorded human history. Plants have been used by humans in many parts of the world as a form of treatment and management for a wide variety of diseases and conditions. According to the World Health Organization (WHO) [206, 207], more than 80% of people all over the world utilize herbs as a kind of treatment when they are sick. Education is a crucial component in the usage of herbs since the capacity to utilize herbs as a therapy for diseases is based on the amount of information possessed by the native people of the area. Plants play a vital part in a wide variety of traditional religious rites, such as libation, sacrifice, the appeasing of the gods, invocation, and divination. In addition, plants are used in the production of food and the delivery of medicine. Plant parts are typically used in the manufacture of herbal treatments since these plant parts are the active elements in herbal medications. Some of the diseases and conditions that have been successfully managed by using herbal medicine include memory loss, cardiovascular disease, arthritis, osteoarthritis, digestive illness, respiratory illness, reproductive illness, skin illness, neurological illness, diabetes, cancer, hypertension, gastrointestinal illness, conditions such as pregnancy, and prenatal and postnatal procedures. Herbal therapy has also been shown to be effective in the treatment of a variety of other diseases and disorders. Herbal drugs are often administered either in powdered or liquid form, with the powdered form being the more prevalent of the two. Some of these products are intended to be used internally, while others can be put on the skin or rubbed into the part of the body that is problematic. There is still a significant amount of work that has to be done in the field of herbal medicines; however, this can be counterbalanced by the potential advantages that can be gained through the utilization of these items. Despite this, it is very necessary to conduct a study to guarantee the accurate identification of the particular chemical components as well as the physiologically active components that are found in these herbal treatments. There is a need for research to be conducted so that it can be determined whether or not the use of herbs in their unprocessed form, as opposed to the use of bioactive substances that have been extracted from the herbs, is more beneficial. There is a major need for additional studies to be conducted on the standardization procedures that are utilized during the manufacturing of herbal goods. This research should be conducted as soon as possible. To ascertain the processing methods, routes of administration, doses, and compatibility with other herbal medicines or conventional treatments, additional research is required.

Abstract

The people of a particular culture and locale utilize plant resources within their environment for diverse purposes, e.g., as food. Plants that are utilized as food also contribute to the health and well-being of the populace. This chapter assesses the relationship between the people of Akwa Ibom State, Nigeria, and the crop plants found in their locality that contribute to health security. People from Akwa Ibom State rely mostly on vegetables for their diet and as medicines, and these plants play numerous roles in their culture. A total of 88 plants from 15 higher plant families were found to be used as food and medicine by the Akwa Ibom people. This chapter will describe these plants as well as their cultural practices, conservation status, and traditional knowledge and utilization patterns. These plants are either used solely or in combination with other plant resources to prepare different local relishes that possess medicinal value for the treatment and management of diverse ailments. These plants include *Cucurbita maxima, Gongronema latifolium, Abelmoschus esculentus*, *Piper guineense*, *Amaranthus hybridus, Justicia schimperi, Ocimum gratissimum, Telfairia occidentalis, Gnetum africana, Crassocephalum crepidioides, Heinsia crinita, Talinum triangulare, Vernonia amygdalina, Lasianthera africana, Colocasia esculentus, Cucumis sativus,* and *Ipomoea batatas*. Plants have been used as food and medicine for decades by all age groups in Akwa Ibom State, Nigeria, although some of them are considered underutilized. However, their utilization as food and medicine is on the increase in the present day, and they will most likely continue to be relevant in the future. Nonetheless, practical measures like value addition, better packaging, and conservation strategies are necessary.

Keywords

Ethnobotany · Indigenous vegetables · Akwa Ibom · Nigeria · Plant Conservation · Plant medicine · Food as medicine

1 Introduction

Ethnobotany is concerned with the dynamic relationship between people of a particular culture and their interactions with the diverse plant resources in their locality in terms of how they are utilized, what they are used for, when they are used, as well as their general relevance to life within the community or society. The field of ethnobotany evolved from the study of plants used by primitive societies [6, 42, 74, 76]. Subsequently, many other workers [43, 93] improved the concepts to include an interdisciplinary and holistic approach that focuses on the realm of the human-plant relationship. This realm of interaction between plants and human defined by economic, sociocultures, and environmental relationships is not limited to the use of plants for food, clothing, and shelter but also include their use for religious ceremonies, ornamentation, and health care [72, 80]. For instance, a previous survey revealed some vegetables eaten by Akwa Ibom people residing in Benin City, Nigeria, which highlighted ten vegetables including Ikong-ubong (*Telfairia occidentalis*), Mmong-mmongikong (*Talinum triangulare*), Atama (*Heinsia crinita*), Afang (*Gnetum africanum*), and Editan (*Lasianthera africana*), either consumed alone or in combination with other plant-based food resources or used in traditional medicines [99]. An ethnobotanical survey of plants is useful in identifying plants that serve in the alleviation of ailments [79, 80]. These plants work either in combination with one or more plants or are used solely. These plants have served and are still serving as leads in the production of orthodox medicines.

Indigenous vegetables are edible plant species peculiar to a particular locality or region with their diversity and distribution depending on geographical location and edaphic and climatic conditions [44, 46, 73, 75, 80]. Some of these plants are naturalized species and are well adapted to specific local conditions. According to Ogwu et al. [76, 77], these plants are grown for their leaves, succulent stems, young shoots, fruits, and/or combination of these plant parts. They may not require formal cultivation because they grow easily in the wild [69]. As protective foods, these indigenous vegetables are widely consumed in tropical regions including Nigeria as important sources of proteins, vitamins, and essential minerals [99]. The knowledge of indigenous plants used as food and medicines is often embedded in indigenous cultures but is slowly eroding with modernization. The decline of cultural diversity and the gradual erosion of human knowledge of medicinal plant species as well as their distribution, management, and methods of extracting medicinal chemicals is a contemporary challenge that is likely to increase in the future unless they are linked to their use as food [23, 24, 81].

This chapter aims to highlight some important vegetables with medicinal properties that are used by the people of Akwa Ibom State, Nigeria, and share their culinary uses and value in the treatment and management of diverse ailments. The chapters begin with an introduction to indigenous vegetables, Nigeria and Akwa Ibom State, and climax by presenting a list of indigenous vegetables associated with people from Akwa Ibom State and discussing their botany, traditional knowledge, and practices as well as their ethnomedicinal usage. The list of indigenous vegetables associated with Akwa Ibom people was sourced from personal knowledge of these vegetables, the work of Etukudo [31], and a few scholarly articles [95, 99]. The essence of the work is to give proper documentation of some of these species for easy access and to make recommendations on the need to conserve these vegetables as they are seen as underutilized crops.

2 Akwa Ibom State, Southern Nigeria

Akwa Ibom State (latitudes 4°32 and 5°53 North and longitudes 7°25 and 8°25 E) is flanked on the east, west, and north by Cross River, Abia, and Rivers states, respectively in the south-southern axis of Nigeria on the sandy deltaic coastal plain of the Guinea Coast (Fig. 1). To the south of the state is the Atlantic Ocean.

Akwa Ibom has a total land area of 8412 km^2 with altitudes of 45–70 m.a.s.l. and includes the Qua Iboe River basin and the lower Imo River basin [28, 99, 103]. The state is located within Nigeria's forest zone and has a tropical rainy climate. It has 31 local government areas composed mainly of the Ibibio, Eket, Annang, Oron, and Okobo ethnic groups. Ibibio is the largest ethnic group in Akwa Ibom and speaks the Ibibio language with diverse dialects [117]. The majority of the populace engages in farming, fishing, trading, hunting, wood-carving, raffia works, blacksmithing, pottery, ironworks, tailoring, and crafts creation. Native diets are mainly plant-based and are extolled for their medicinal values including efere afang, Edikang ikong,

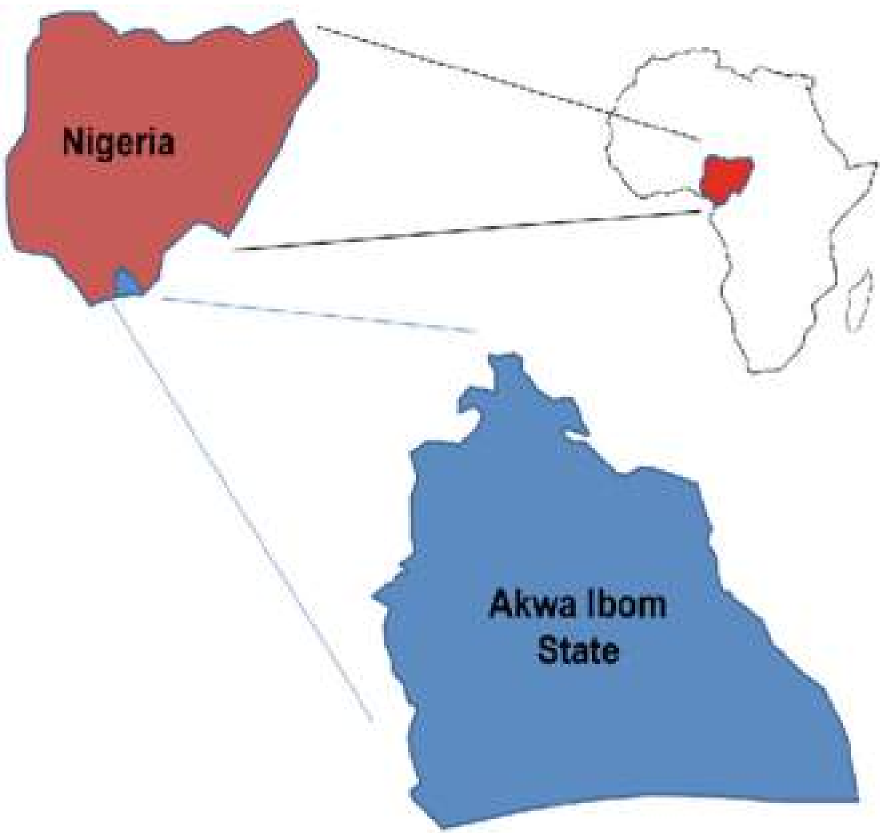

Fig. 1 Map of Africa showing Nigeria with Akwa Ibom highlighted in blue. (Source: Ref. [9])

efere etidot (bitter leaf soup), efere atama, efere editan, efere ikon, efere otong, afiaefere, eferendekiyak, efere etighi, efere ndukpauyo, efere mmongmmongikong, and eferenyama. Most of these soups go with coarse starchy food such as garri, pounded yam, wheat flour, and fufu.

3 Indigenous Vegetables Used as Food and Medicine in Akwa Ibom

The term vegetable is not strictly botanical but arbitrary and largely based on the mode of plant utilization rather than on their plant morphology [37]. For instance, Vainio and Bianchini defined vegetables as all edible plant parts including stem, stalk, root, tuber, bulb, leaves, flowers, fruits, or seeds, whereas Remison [106] suggested that plants are grown for their useable parts like leaves or young shoots, fruits, or a combination of usable plant parts like leaves and fruits. Vegetables can be fruity or leafy and may be soft and fleshy plant parts eaten raw or cooked, mature or immature, or both. Some plants used as vegetables also have horticultural values. Asaolu et al. [12] reported that vegetables are widely consumed in the processed, semi-processed, or raw form as part of a main dish or salad because of the taste they add to food. Many plants used as vegetables in Akwa Ibom are native to the Flora of Nigeria and considered resilient, adaptive, and tolerant to adverse climates. Knowledge of these plants has been transmitted from one generation to the next orally and without adequate documentation. The practice is still prevalent among rural and tribal communities within the state albeit unsustainable because of the potential loss of information about important species and best practices such as the method of propagation, mode of preparation, and preservation. These indigenous vegetables are cheap, flavory, and colorful and add aesthetic appeal to local diets [62]. They make up an important part of daily diets because of their carbohydrate, protein, mineral, vitamins, fiber, and other nutritional contents [32, 65]. In Akwa Ibom, despite their low calorific value, they are eaten either in the form of leaves, seeds, fruits, flowers or pods, roots, stems, and tubers and are a source of many nutrients including potassium, folic acid, vitamin A, and vitamin C [85, 91]. The low caloric content of these local vegetables is because plants produce food in the leaves but many do not store food in the leaves [32, 45, 73, 83]. Fibers in vegetables are known to promote digestion and prevent constipation [46, 64, 96–98]. The nutrients in vegetables can be absorbed as regulatory and protective nutrients, as well as for bodybuilding [12]. During the rainy season, vegetables are abundant in the wild, market, and home gardens and are relatively cheaper unlike in the dry season when there is general scarcity leading to higher prices as demands cannot be met [94]. A few of these vegetables are domesticated and marketed, thus serving as a source of household income.

Akwa Ibom State indigenes are well known for their local delicacies with high food and medicinal values. These delicacies are prepared using traditional methods. The scientific and common names of some of these vegetables are presented in Table 1, while their plant family distribution is presented

Table 1 Indigenous vegetables common to Akwa Ibom people

Family	Species	Names in Akwa Ibom
Gnetaceae	*Gnetum Africana*	Afang
Rubiaceae	*Heinsia crinita*	Atama
Portulaceae	*Talinum triangulare*	Mmongm mongikong
Cucurbitaceae	*Telfairia occidentalis*	Nkong
Icacinaceae	*Lasianthera Africana*	Editan
Asteraceae	*Vernonia amygdalina*	Etidod
Asclepiadaceae	*Gongronema latifolium*	Utasi
Malvaceae	*Abelmoschus esculentus*	Etighi
Lamiaceae	*Ocimum gratissimum*	Nton
Piperaceae	*Piper guineense*	Odusa
Amaranthaceae	*Amaranthus hybridus*	Iyanafia
Acanthaceae	*Justicia schimperi*	Mmemme
Araceae	*Colocasia esculentus*	Eka ikpori
Asteraceae	*Crassocephalum crepidioides*	Mkpafid
Convolvulaceae	*Ipomoea batatas*	Ediam makara
Cucurbitaceae	*Cucumis sativus*	Okokon
Cucurbitaceae	*Cucurbita maxima*	Ndise
Euphorbiaceae	*Microdesmis puberula*	Ntanebid, Ntabid
Zingiberaceae	*Aframomum melegueta*	Ntuen-ibok
Amaryllidaceae	*Allium sativum*	Etebe-owo inua
Liliaceae	*Aloe vera* (and *A. barbadensis*).	Akokafid
Gentianaceae	*Anthocleista djalonensis*	Ibu
Acanthaceae	*Acanthus montanus*	Mbara ekpe
Amaranthaceae	*Achyranthes aspera*	Udok mbiok, Udok mbiet
Amaranthaceae	*Alternanthera bettzickiana*	Nkpok isip essien
Amaranthaceae	*Cyathula prostrata*	Nkibe ubuk
Amaryllidaceae	*Allium cepa*	Ayim
Caricaceae	*Carica papaya*	Okpod, popo
Polygalaceae	*Carpolobia lutea*	Ikpafum
Anacardiaceae	*Lannea acida*	Ayara nsukakara
Anacardiaceae	*Lannea nigritana*	Odok eto
Anacardiaceae	*Anacardium occidentale*	Cashew
Anacardiaceae	*Mangifera indica*	Mango
Annonaceae	*Uvaria chamae*	Nkarika ekpo, atama nkana
Annonaceae	*Monodora myristica*	Enwun
Araceae	*Caladium bicolor*	Ikpon ekpo, udia edi
Araceae	*Xanthosoma sagittifolium*	Ikpon mbakara
Asteraceae	*Tridax procumbens*	Ayara utimense
Asteraceae	*Emilia sonchifolia*	Utime nse, usio mmon
Asteraceae	*Crassocephalum crepidioides*	Mkpafit
Boraginaceae	*Heliotropium indicum*	Otukeyin eka, esin ono
Bignoniaceae	*Spathodea campanulata*	Esenim
Bignoniaceae	*Newbouldia laevis*	Itumo, oboti

(continued)

Table 1 (continued)

Family	Species	Names in Akwa Ibom
Bignoniaceae	*Kigelia Africana*	Ntabinim
Bromeliaceae	*Ananas comosus*	Eyop mbakara
Burseraceae	*Dacryodes klaineana*	Eben ikot
Clusiaceae	*Allanblackia floribunda*	Udiaebion, ekporo-enin
Combretaceae	*Combretum micranthum*	Asaka
Combretaceae	*Terminalia ivorensis*	Nkot ebene
Convulvulaceae	*Ipomoea quamoclit*	Ediam ikanikot
Convulvulaceae	*Ipomoea pileata*	Mkpafiafian
Costaceae	*Costus afer*	Mbritem
Crassulaceae	*Bryophyllum pinnatum*	Ndodop afiaiy
Cucurbitaceae	*Citrullus colocynthis*	Ikon, ikpan
Cucurbitaceae	*Momordica balsamina*	Mbiadon edon
Dioscoreaceae	*Dioscorea dumetorum*	Enem, edidia iwa
Euphorbiaceae	*Euphorbia hirta*	Etinkene ekpo
Euphorbiaceae	*Jatropha curcas*	Ukim eyio
Euphorbiaceae	*Manihot esculenta*	Iwa
Euphorbiaceae	*Manniophyton fulvum*	Ekonikon
Euphorbiaceae	*Mallotus oppositifolius*	Uman nwariwa
Fabaceae	*Afzelia Africana*	Eyin mbukpo
Fabaceae	*Afzelia bella*	Eyin mbukpo
Fabaceae	*Albizia lebbeck*	Ubam
Fabaceae	*Baphia nitida*	Afuo
Fabaceae	*Cajanus cajan*	Nkoti
Fabaceae	*Cassia alata*	Adaya okon
Fabaceae	*Glycine max*	Nkoti eto
Fabaceae	*Lonchocarpus cyanescens*	Awa
Fabaceae	*Parkia biglobosa*	Ukon uyayak
Fabaceae	*Pentaclethra macrophylla*	Ukana
Fabaceae	*Pterocarpus erinaceus*	Ukpa
Fabaceae	*Pterocarpus santalinoides*	Nkpa-inyan
Fabaceae	*Tetrapleura tetraptera*	Uyayak
Hypericaceae	*Harungana madagascariensis*	Oton
Irvinginiaceae	*Irvingia gabonensis*	Uyo

in Fig. 2. Almost 80 plants from 15 higher plant families are presented here based on oral historical records and the work of Etukudo [31]. Cucurbitaceae and Asteraceae were the plant families with the highest representations. Earlier, Osawaru et al. [99] conducted an ethnobotanical survey of vegetables eaten by Akwa Ibom residents in Benin City, Nigeria, and reported a total of ten vegetables. Similarly, Ajibesin et al. [9] surveyed plants in Akwa Ibom State used for skin disease and other related ailments and documented 183 medicinal plant species representing 153 genera and 59 families.

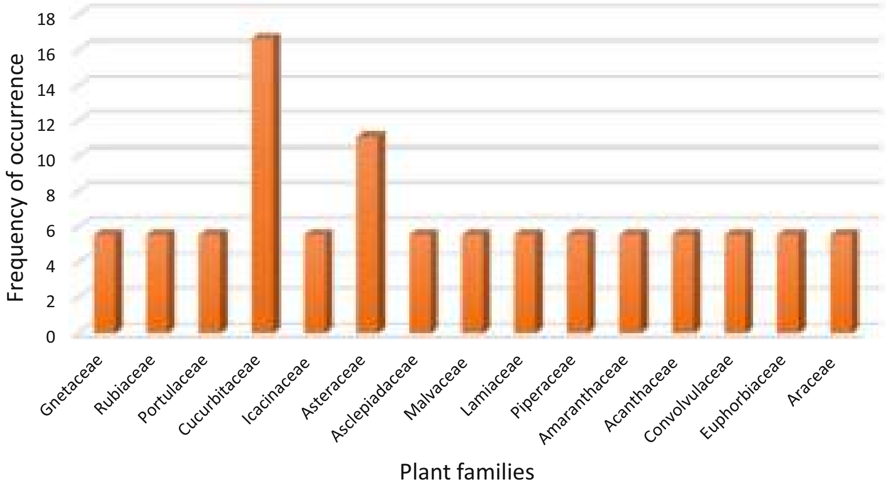

Fig. 2 Plant family distribution of indigenous plants used as food and medicine by Akwa Ibom people, Nigeria

The utilization mode and pattern, parts used, and cultivation status and sources of these indigenous vegetables used for food and health by Akwa Ibom people are presented in Table 2.

4 Botanical Description, Knowledge, and Practices Associated with the Vegetables Indigenous Used as Food and Medicine by Akwa Ibom People

The description and local utilization and knowledge and practices associated with some indigenous vegetables used as food and medicine in Akwa Ibom are presented below.

4.1 *Gnetum africanum*

Description, utilization, knowledge, and practices. It is a creeping vine. The leaves are collected as forest products. The leaves are used in the preparation of the local delicacy "Efere afang." The different recipes on how the dish is prepared mark the cultural identity of the Akwa Ibom people. Soup is one of the main meals for any kind of ceremony. The stem is used in preparations for medical concoctions to ease childbirth. The seeds and leaves are used in the treatment of piles, sore throat, and high blood pressure. It also serves as a purgative and the supple stem is sometimes used as rope. The mineral element composition of *G. africanum* is as follows: Ca, 130 ppm; Mg, 89.0 ppm; Fe, 76.1 ppm; and Zn, 1.3 ppm, while cadmium and lead were not detected [48].

Table 2 Status, utilization, and conservation status of the indigenous vegetables

Species	Status	Utilization (food and/or medicine)	Part used
Gnetum Africana	Wild; cultivated	Food, medicine	Leaves, stem, and seeds
Heinsia crinita	Wild; cultivated	Food, medicine	Leaves
Talinum triangulare	Wild; cultivated	Food, medicine	Leaves, stems
Telfairia occidentalis	Cultivated	Food, medicine	Leaves, seeds
Lasianthera Africana	Cultivated; wild	Food, medicine	Leaves
Vernonia amygdalina	Wild; cultivated	Food, medicine	Leaves
Gongronema latifolium	Wild; cultivated	Food, medicine	Leaves
Abelmoschus esculentus	Cultivated	Food, medicine	Leaves, seeds, pods
Ocimum gratissimum	Cultivated	Food, medicine	Leaves
Piper guineense	Cultivated	Food, medicine	Leaves
Amaranthus hybridus	Cultivated	Food, medicine	Leaves
Justicia schimperi	Cultivated	Food, medicine	Leaves
Colocasia esculentus	Cultivated, wild	Food	Whole plant
Crassocephalum crepidioides	Cultivated	Food, medicine	Leaves
Ipomoea batatas	Cultivated	Food, medicine	Leaves, roots
Cucumis sativus	Cultivated	Food, medicine	Whole plants
Cucurbita maxima	Cultivated	Food, medicine	Leaves, seeds, roots
Microdesmis puberula	Cultivated	Food, medicine	Whole plant
Aframomum melegueta	Cultivated	Medicine	Leaves, seeds
Allium sativum	Cultivated	Food, medicine	Bulb
Aloe vera (and *A. barbadensis*)	Cultivated	Medicine	Leaves, juice
Anthocleista djalonensis	Wild	Medicine	Bark, leaves
Acanthus montanus	Wild	Medicine	Stem, leaves
Achyranthes aspera	Wild	Medicine	Seeds, leaves
Alternanthera bettzickiana	Wild, cultivated	Medicine	Leaves, young shoot
Cyathula prostrata	Cultivated	Medicine	Leaves
Allium cepa	Cultivated	Food, medicine	Bulb, leaves
Carica papaya	Cultivated	Food, medicine	Leaves, seeds, fruits
Carpolobia lutea	Cultivated	Food, medicine	Leaves, fruits, stembark
Lannea acida	Semi-cultivated, wild	Medicine	Bark, leaves
Lannea nigritana	Cultivated, wild	Food, medicine	Seeds, fruit, roots
Anacardium occidentale	Cultivated, wild	Food, medicine	Bark, leaves, fruits
Mangifera indica	Cultivated	Food, medicine	Fruits, leaves, stem

(continued)

Table 2 (continued)

Species	Status	Utilization (food and/or medicine)	Part used
Uvaria chamae	Wild	Medicine	Root
Monodora myristica	Cultivated	Food, Medicine	Seeds
Caladium bicolor	Wild	Medicine	Leaves, rhizome, corm
Tridax procumbens	Wild	Medicine	Leaves
Emilia sonchifolia	Wild	Medicine	Leaves, young shoot
Crassocephalum crepidioides	Wild	Medicine	Leaves, roots
Heliotropium indicum	Wild	Medicine	Leaves
Spathodea campanulata	Cultivated	Medicine	Seeds, roots, bark
Newbouldia laevis	Cultivated	Medicine	Stem- bark
Kigelia africana	Cultivated	Medicine	Seeds, fruits
Ananas comosus	Cultivated	Food, medicine	Fruit
Dacryodes klaineana	Cultivated	Food, medicine	Fruit, leaves
Allanblackia floribunda	Semi-cultivated, wild	Medicine	Seed, bark
Combretum micranthum G	Cultivated	Medicine	Seed, leaves, roots
Terminalia ivorensis	Cultivated, wild	Medicinal	Bark, root
Ipomoea quamoclit	Cultivated	Medicine	Leaves
Ipomoea pileata	Cultivated	Medicine	Leaves
Costus afer	Wild, cultivated	Medicine	Leaves, fruits
Bryophyllum pinnatum	Cultivated	Medicine	Leaves
Citrullus colocynthis	Cultivated	Food, medicine	Seed, fruit
Momordica charantia	Cultivated	Food, medicine	Fruit, young shoots, leaves
Dioscorea dumetorum	Cultivated	Food, medicine	Root, tuber
Euphorbia hirta	Wild	Medicine	Young leaves and shoot
Jatropha curcas	Cultivated	Food	Seeds
Manihot esculenta	Cultivated	Food, medicine	Tuberous roots, young leaves
Manniophyton fulvum	Wild, semi-cultivated	Medicine	Seed, root, leaves, stem
Mallotus oppositifolius	Wild, semi-cultivated	Medicine	Leaves, stem bark
Afzelia africana	Semi-cultivated	Medicine	Leaves
Afzelia bella	Cultivated	Medicine	Leaves, bark
Baphia nitida	Cultivated	Medicine	Seeds
Cajanus cajan	Cultivated	Food, medicine	Seeds, shoot, leaves
Cassia alata	Wild, cultivated	Medicine	Leaves, seedpods
Glycine max	Cultivated	Food, medicine	Seeds

(continued)

Table 2 (continued)

Species	Status	Utilization (food and/or medicine)	Part used
Lonchocarpus cyanescens	Cultivated	Medicine	Leaves, roots
Parkia biglobosa	Cultivated	Food, medicine	Seed, Leaves
Pentaclethra macrophylla	Cultivated	Food, medicine	Stem, fruit, seed
Pterocarpus erinaceus	Cultivated	Medicine	Stem bark
Pterocarpus santalinoides	Cultivated	Medicine	Seed, leaves, root
Tetrapleura tetraptera	Cultivated	Food, medicine	Seed
Harungana madagascariensis	Cultivated	Food, medicine	Fruit, bark
Irvingia gabonensis	Wild, cultivated	Food, Medicine	Seed

Cultivation requirements and management within Akwa Ibom: The vegetables are often grown in the wild although some are cultivated in the home gardens. The stem cuttings are usually planted in the soil and properly watered till the plant germinates. As they grow, the plant requires some support such as a tree to grow into.

4.2 *Heinsia crinita*

Description, utilization, knowledge, and practices: It is usually cultivated or wild. The vegetable is used in the preparation of the local dish "Efere Abak." It is also used in pediatric care for the treatment of measles. The mineral element composition of *H. crinita* is reported as follows: K, 84.41 mg/g; Ca, 24.20 mg/g; Mg, 11.31 mg/g; and P, 9.14 mg/g [89].

Cultivation requirements and management within Akwa Ibom: The vegetable is propagated by seed and stem cuttings on loamy soil. The cultivated crops grow into a shrub or trees and are available all year round.

4.3 *Talinum triangulare*

Description, utilization, knowledge, and practices: The leaves and stems are used as a softener when cooking fibrous vegetables such as Afang (*G. africanum*), Atama (*H. crinita*), and fluted pumpkin (*T. occidentalis*). It is also used for its high medicinal value, usually in the treatment of diuretics and stomach problems [67].

Cultivation requirements and management within Akwa Ibom: Waterleaf is propagated by seed but also vegetatively by cutting 15–20 cm of the matured stem. It is a fast-growing plant that once established can easily reseed itself because it is selfpollinating and produces flowers early year-round. It is an ephemeral crop that is due for harvest between 35 and 45 days after planting (Udoh and Etim 2008). Some are wild or weedy.

4.4 *Telfairia occidentalis*

Description, utilization, knowledge, and practices. It is a vine plant often grown in a homestead garden. Due to its creeping nature, it is usually staked into a framework of bamboo, or a shelf is made for it to climb on when twining [88]. *Telfairia occidentalis* shoots and leaves are used in preparing Edikang ikong soup. Much importance is placed on the crop for its edible seeds which are rich in protein and fat and can be eaten as a whole by boiling. The sliced leaves can be mixed with coconut water and salt used for the treatment of convulsion. The leaves are also used in the management of anemia because of the high iron content, while the roots are used as rodenticides [35, 68].

Cultivation requirements and management within Akwa Ibom: Seeds are planted directly in the soil, typically in groups of three to increase output in a case of a failed germination. Although dependent on soil type, the fluted gourd can grow and subsequently produce many flushes of fruit over long periods [7]. The seeds cannot be stored for more than 3 days once they are extracted from the fruit.

4.5 *Lasianthera africana*

Description, utilization, knowledge, and practices. It is a perennial, glabrous shrub. The leaves are highly valued for their medicinal properties including the ability to relieve stomach complaints with or without diarrhea, as vermifugal, and for cold as a wash against headache. Leaf sap is considered anti-psoric and is crushed in warm water, which raises an abundant froth that is used to bathe feverish infants. Pulped leaf or pulped bark is made up into a dressing to bind over fractures. Tests for alkaloids have given mild response for the leaf, moderate for the bark, and strong for the root, and tannin is present in all these parts. Notwithstanding the presence of alkaloids and tannin, certain tribes like the Akwa Ibom people put the leaf in soup. The leaves are used as antacid, analgesic, antispasmodic, laxative, antipyretic, antiulcerogenic, antidiabetic, and antimalarial because of their bacteriostatic, anti-ulcer, fungicidal, antidiabetic, and antiplasmodial properties [29, 49, 50, 86, 87]. The plant also has social roles in ceremonies as well as in food preparation. The mineral element composition of *L. Africana* is as follows: potassium, 56.24 mg/g; calcium, 31.43 mg/g; magnesium 31.99 mg/g; and phosphorus, 5.00 mg/g [89].

Cultivation requirements and management within Akwa Ibom: It is cultivated through the propagation of adult stem cuttings [84].

4.6 *Vernonia amygdalina*

Description, utilization, knowledge, and practices. It is a shrub and can grow into a small tree. The leaves have a characteristically bitter taste and the extracts are used medicinally in the treatment of cough, fever, and pile and as a laxative. The vegetable is used in the preparation of the local relish such as efere etidod, and efere ikon. The leaves are washed before use to get rid of their bitter taste. The stems are used as a chewing stick for oral hygiene as well as the management of dental problems. They can be found as weeds in the wild and cultivated in the home garden. The active ingredient (vernonioside B) possesses antiparasitic, antitumoral, and antibacterial agents [114].

Cultivation requirements and management within Akwa Ibom: It is cultivated through the propagation of adult stem cuttings.

4.7 *Gongronema latifolium*

Description, utilization, knowledge, and practices: It is a climbing shrub usually used as a spice and vegetable [119]. In soups, it imparts its beautiful and agreeable bitter taste to the food. It is also eaten alone raw or added to other meals like plantain porridge, yam porridge, etc. The leaves are also incorporated into salads. The twigs and branches are used as chewing sticks [31]. Abbiv [1] records that the leaves are rubbed on joints to enable children to walk early. It is a cough, diabetes, malaria, and hypertension remedy [30]. Leaf extract or cold infusion of pounded leaf mixed with lime or pineapple juice is used as a blood tonic and is also known to expel intestinal worms and help with upset stomach and for the treatment of typhoid fever [30].

Cultivation requirements and management within Akwa Ibom: *G. latifolium* is propagated by soft stem or hard stem cuttings.

4.8 *Abelmoschus esculentus*

Description, utilization, knowledge, and practices. It is a tall erect annual plant with edible leaves, pods, seeds, and flowers. The leaves, flowers, and young shoots are eaten as vegetables. It contains mucilage which gives the soup a slimy, sticky texture. It can be sliced, dried, powdered, and preserved for future use. This serves as a flavoring and as a soup thickener. The seeds are eaten as snacks after roasting.

Cultivation requirements and management within Akwa Ibom: *A. esculentus* are cultivated through seedlings. Usually, the seeds are soaked overnight to have uniform germination. Two to three seeds are sowed per hole at 3 cm depth. The crop is usually watered regularly.

4.9 *Ocimum gratissimum*

Description, utilization, knowledge, and practices: It is a perennial shrub. The leaves have a strong fragrance with a strong aroma. The leaves are used as a seasoning in the preparation of pepper soup. Medicinally, it is used in the treatment of high fever and piles. The leaves may be taken for catarrh medication. A paste of the leaves is applied topically against ringworm and skin diseases. Crushed leaf extract together with leaf extracts is used to treat diabetes and pile. More so, most of the respondents claim that the scent from the leaves of the plant is also used to protect against snakes.

Cultivation requirements and management within Akwa Ibom: *O. gratissimum* is propagated by seeds and soft stem cutting and is usually available all year round.

4.10 *Piper guineense*

Description, utilization, knowledge, and practices: It is a climbing shrub commonly used as a spice in the preparation of meals especially soups like efereetek, edikangikong, afiaefere. This crop is used to facilitate the swallowing of coarse-textured starchy food. The vegetable is also used by Akwa Ibom people to add flavours to their local dishes. Ethnomedicinally, it is used in the regulation of the menstrual cycle. The fruits and leaves are used as a spice for preparing soup for postpartum women.

Cultivation requirements and management within Akwa Ibom: The crop is propagated by seeds.

4.11 *Amaranthus hybridus*

Description, utilization, knowledge, and practices: It is an erect annual plant with leaves used as vegetables in cooking porridge and vegetable sauce and also in the local delicacy ekpang nkukwo [125]. The crushed leaves are useful as an antidote for snake and scorpion bites. The plants are also used by the tribal people to feed animals.

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds and they germinate readily if the soil is warm.

4.12 *Justicia schimperi*

Description, utilization, knowledge, and practices: It is an annual or perennial herb. The leaves are edible and are used in cooking soups, plantain porridge, and many other delicacies. The leaves are cooked in a palm fruit filtrate and fed to babies.

It is used as an enema to treat umbilical problems in infants. The leaves are also used in treating chest and heart problems (Inyang [31]).

Cultivation requirements and management within Akwa Ibom: It is usually propagated by seeds and germinates readily with the availability of rain.

4.13 *Colocasia esculentum*

Description, utilization, knowledge, and practices: It is a perennial plant commonly grown for its starchy edible underground tuber that is consumed after boiling, frying, or roasting with soup or stew. It can be cooked as cocoyam porridge or grated and used to prepare ayan ekpang which is eaten with a mucilaginous soup rich in meat, periwinkle, and fish [31]. The corm and leaves are used for the preparation of the local delicacy ekpang nkukwo. They are mostly cultivated in home gardens around the homestead, while some can be found as weeds. The tender petioles are leaves that are also eaten when young. The matured leaves are used as wrapping materials. Consumption of the plant (corm and leaves) is believed to have effect on constipation, diarrhea, skin rash, injuries and neurological disorders.

Cultivation requirements and management within Akwa Ibom: The top of the corm or the whole cormel is used for propagation usually on ridges when the rains are reliable [106].

4.14 *Crassocephalum crepidioides*

Description, utilization, knowledge, and practices: It is an annual herb with soft stems. The leaves and tender shoots are edible as vegetables or spinach, especially by elderly people on very auspicious occasions. The leaves when used as soup cure indigestion and give general comfort and well-being to the gastrointestinal system [31].

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds or through stem cuttings.

4.15 *Ipomoea batatas*

Description, utilization, knowledge, and practices: It is a herbaceous perennial creeping vine. The tender leaves and young shoots are eaten as vegetables or spinach. They are also used to wrap grated cocoyam mash during the preparation of ekpang nkukwo, especially in the dry season when the usual wrapping leaves are scarce and costly. Leaves are antidiabetic and antiscorbutic.

Cultivation requirements and management within Akwa Ibom: Cultivation is done by stew cuttings about 30 cm long or portions of tubers. Planting is usually done in ridges or mold. The crops are planted when the rains are well established [106].

4.16 *Cucumis sativus*

Description, utilization, knowledge, and practices: It is a trailing or climbing monoecious annual herb with an extensive and largely superficial root system [106]. The green fruits are eaten fresh in salad and are rich in vitamin B, iron, and calcium and believed to have diuretic and purgative effects. The leaves are eaten as vegetables either raw in a salad or cooked [20]. The fruit contains 95% water. Proteins, fat, carbohydrates, fiber, and ash make up the chemical composition of *Cucumis sativus*.

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds. The seeds are sown directly in ridges or molds or prepared planting holes. Plants seeded directly may be thinned to two or three plants per stand after establishment. The plant is sometimes stalked especially for some creeping cultivars [106].

4.17 *Cucurbita maxima*

Description, utilization, knowledge, and practices. It is an annual herb with thick climbing or creeping stems [107]. The leaves, tender shoots, and flowers of the plants are used as vegetables or pot-herb cooked in soups and is believed to help relive intestinal infections, stomach discomfort, and kidney issues. They are also used to prepare yams, cocoyam, sweet yam, and water porridge. The pulp is eaten after the whole fruit had been cooked. It can be eaten salted with stew or soup or as a vegetable.

Cultivation requirements and management within Akwa Ibom: It is propagated through direct seedlings in homestead gardens and grows well on organic matter [107].

4.18 *Microdesmis puberula*

Description, utilization, knowledge, and practices: *Microdesmis puberula* is a shrub or miniature tree. Edible leaves are used to prepare afang soup. The leaves may be pounded and mixed with alligator pepper seeds or ginger and applied on sprains, burns, and bruises for healing [31]. The twigs are used as chewing sticks to clean teeth and strengthen gums. It is sometimes taken orally or applied as an enema to treat diarrhea and is prescribed for pregnant women and young children [128].

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds and can germinate massively in fallow land.

4.19 *Aframomum melegueta*

Description, utilization, knowledge, and practices: It is a perennial herb. The seeds are used as a traditional spice (ground or whole) for native ceremonies to welcome guests and ward off evil spirits. The seeds have a hot, pungent black-peppery flavor with a hint of citrus [113]. It is used traditionally in threes or sevens. It is used in almost if not all medicaments. The seeds are revulsive and carminative. They are used to strengthen drinks among other uses. The seeds are edible and are a stimulant.

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds.

4.20 *Allium sativum*

Description, utilization, knowledge, and practices: It is a perennial herb. It is used to flavor soups, salads, and sausages. It is a classic ingredient of many cuisines and has a pungent, spicy flavor. The leaves are also edible. It is used in the treatment of several health-related issues like dysuria, and bronchitis [31]. They can also be used as antibiotics and antiseptics [102].

Cultivation requirements and management within Akwa Ibom: Propagation is by asexual reproduction. The cloves are planted in the soil and probably watered.

4.21 Aloe vera (*A. barbadensis*)

Description, utilization, knowledge, and practices: It is a perennial herb up to 160 cm tall, usually with or without a stem. It is a well-known medicinal plant with dermatological and other health benefits in Akwa Ibom. It is used in skin care, to alleviate stress, for heartburns, indigestion, etc. among other uses.

Cultivation requirements and management within Akwa Ibom: It is propagated vegetatively.

4.22 *Anthocleista djalonensis*

Description, utilization, knowledge, and practices: It is a tree growing in the wild. It is widely used as a strong purgative and diuretic. The bark is usually used to cure painful menstruation and gonorrhea. It is used as an abortifacient [26]. It is used in the treatment of several other ailments.

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds.

4.23 *Acanthus montanus*

Description, utilization, knowledge, and practices: It is a prickly semi-woody herb, nearly 2 m high. The plant is used as an ornamental because of its beautiful flowers and peculiar leaves. The leaves are taken by pregnant women to stop internal lower abdominal heat. Similarly, leafy twigs are used to cure several problems such as upset stomach, painful menstruation, cough, and whooping cough [31].

Cultivation requirements and management within Akwa Ibom: It is vegetatively propagated.

4.24 *Achyranthes aspera*

Description, utilization, knowledge, and practices: *Achyranthes aspera* is a perennial, erect herb used in the treatment of dropsy, piles, and boils in children as well as of asthma, bleeding, bronchitis, cold, cough, colic, debility, dog bite, dysentery, headache, ear complications, leukoderma, pneumonia, renal complications, scorpion bite, snake bite, and skin diseases [51]. It is also used as herbal medicine, especially in obstetrics and gynecology to treat abortion, induction of labor, and postpartum bleeding [56].

Cultivation requirements and management within Akwa Ibom: It grows in the wild as an invasive species.

4.25 *Alternanthera bettzickiana*

Description, utilization, knowledge, and practices: *Alternanthera bettzickiana* is an herbaceous perennial herb. It is used in amenity planting [31]. The leaves are cooked as a vegetable and used in the management of anemia in children, as well as hepatitis, tight chest, and asthma, and to improve general health and well-being [60].

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds or cuttings.

4.26 *Cyathula prostrata*

Description, utilization, knowledge, and practices: It is an annual to perennial branched herb/shrub often harvested for local use, especially as a medicine but also as food. It is used to treat many ailments including dysentery, wounds, and eye trouble [20].

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds and stem cuttings.

4.27 *Allium cepa*

Description, utilization, knowledge, and practices: It is a perennial plant grown as an annual. It is used as a spice, flavoring agent, food plant, and vegetable. The immature and matured bulbs may be eaten fresh or cooked and eaten as a vegetable. *Allium cepa* is added to soups and sauces as a seasoning and flavoring agent. Onions are eaten raw to ease cough [31]. It is used as hypotensive, diuretics, and depurative.

Cultivation requirements and management within Akwa Ibom: It is propagated by sowing the bulb directly into the soil.

4.28 *Carica papaya*

Description, utilization, knowledge, and practices: Large herbaceous perennial plant with a soft single stem and sparely arranged leaves at the top of the trunk, whereas the lower trunk is scarred where leaves and fruits are born [112]. The fruits are edible. It is also used medically for weak digestion. Pawpaw juice is used in the treatment of eczema and ulcer [31]. Traditionally, the leaves are used in the treatment of malaria as well as an abortifacient and purgative agent or smoked to help remedy asthma (Titanji et al. 2008).

Cultivation requirements and management within Akwa Ibom: This plant is cultivated by seed.

4.29 *Carpolobia lutea*

Description, utilization, knowledge, and practices: It is a shrub or small tree with sweet edible fruits. The soft stem is used as a chewing stick. It is used to cure stomachaches and bone fractures and to boost sexual performance [70]. The root is used in the treatment and management of reproductive issues including as an aphrodisiac, the facilitation of childbirth, and treatment of sterility as well as other ailments like headache and worm infestation [63].

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.30 *Lannea acida*

Description, utilization, knowledge, and practices: It is a multipurpose shrub cultivated for its medicinal and edible values. Its berry-like fruits occur in large clusters and may be consumed fresh or dried [66]. The plant parts are used in the treatment of various ailments including skin injuries and inflammations, general body pain, gastrointestinal problems, fever and malaria, gynecological and pregnancy disorders, hemorrhoids, skin diseases, and infections [39].

Cultivation requirements and management within Akwa Ibom: Propagation is done by seeds.

4.31 *Lannea nigritana*

Description, utilization, knowledge, and practices: It is a small shrub with brownish flowers and fruits. It is used for amenity planting. The leaves are used to treat burns hence its Ibibio name (Uma-ikan). The bark is used by Akwa Ibom people to treat intestinal pains and dysentery. The leaves are administered as an enema for treating abdominal complaints [19].

Cultivation requirements and management within Akwa Ibom: Propagation is done by seeds.

4.32 *Anacardium occidentale*

Description, utilization, knowledge, and practices: It is a shrub cultivated for diverse uses including as medicine and as a source of commodities (raw material). The fruits are eaten raw or cooked and usually have an astringency that leaves the mouth feeling furry. The leaves are used as a febrifuge and in the treatment of malaria [10]. The fruit is anti-scorbutic, astringent, and diuretic [109]. The nutshell is used locally to draw tattoos. The sap or bark is considered to be a contraceptive [15]. The root is used as a purgative.

Cultivation requirements and management within Akwa Ibom: Propagation is done by seeds and usually requires very little management practices.

4.33 *Mangifera indica*

Description, utilization, knowledge, and practices: *M. indica* is a large, evergreen tree grown for its edible fruits. It is one of the oldest cultivated plants. The fruit is consumed for its fresh spicy flavored taste. The bark is used either through decoction or infusion is used to treat jaundice, rheumatism, diarrhea, and dysentery. The flowers are used to repel mosquitoes [15]. The leaves have astringent properties and are infused to reduce blood pressure and treat asthma, cough, and diabetes [15].

Cultivation requirements and management within Akwa Ibom: Propagation is done by seeds and usually requires very little management practices.

4.34 *Uvaria chamae*

Description, utilization, knowledge, and practices: It is a climbing shrub or small tree. The plant is harvested from the wild for edible fruits, while the medicinally important roots are sold in local markets. The root purgative, respiratory, and antipyretic benefits are used by Akwa Ibom people to treat dysentery, nasal congestions, and catarrh [31].

Cultivation requirements and management within Akwa Ibom: It grows in the wild.

4.35 *Monodora myristica*

Description, utilization, knowledge, and practices: it is a perennial edible plant. The seeds are used as a spice because of the nutmeg-like odor and taste. The seed has anti-sickling properties and is consumed to maintain good health [122]. The stem and bark are used in the treatment of stomachaches, fever pains, and eye disease [57].

Cultivation requirements and management within Akwa Ibom: It is cultivated by seeds.

4.36 *Caladium bicolor*

Description, utilization, knowledge, and practices: *Caladium bicolor* also called fancy-leafed caladium, elephant's ear, and heart of Jesus because of its leaves and ornamental value. In Akwa Ibom, it grows in the wild as tubers and produces berry fruits with several small ovoid seeds. Fresh leaves are used in the treatment of angina, while dried powdery leaves are placed on sores for them to heal and as facial treatments [17].

Cultivation requirements and management within Akwa Ibom: It grows in the wild.

4.37 *Tridax procumbens*

Description, utilization, knowledge, and practices: *Tridax procumbens* is a prostrate herbaceous plant that is covered with erect stiff hairs [120]. The leaves are opposite, simple, and thick and with dense hairs. The extracts of *Tridax procumbens* leaves have antimicrobial activity and stimulate wound healing [115]. In Akwa Ibom, the leaves are crushed and used in the treatment of skin spots [31].

Cultivation requirements and management within Akwa Ibom: It grows in the wild.

4.38 *Emilia sonchifolia*

Description, utilization, knowledge, and practices: *Emilia sonchifolia* is a branching, annual herb with lyrate-pinnatilobed leaves [52, 66]. In Akwa Ibom, the plant leaves are crushed to release the juice which is then applied to wound, measles, and rashes.

Cultivation requirements and management within Akwa Ibom: It is propagated wild by seed.

4.39 *Crassocephalum crepidioides*

Description, utilization, knowledge, and practices: It is an erect annual, slightly succulent herb. The fleshy, mucilaginous leaves and stems may be eaten despite the presence of plant toxins [5, 25, 38]. The leaves and stems help with indigestion and act as a laxative, purgative, and remedy for lever problems [13]. In Akwa Ibom it is also used to treat wounds, boils, and burns.

Cultivation requirements and management within Akwa Ibom: It is propagated wild by seed.

4.40 *Heliotropium indicum*

Description, utilization, knowledge, and practices: *Heliotropium indicum* is a robust annual herb that occurs as a weed [101, 105]. Traditionally, the plant leaves are used for wound healing, antidote, bone fracture, boils, febrifuge, eye infections, menstrual disorders, nerve disorders, kidney problems, and antiseptic purposes [116].

Cultivation requirements and management within Akwa Ibom: It is propagated wild by seed.

4.41 *Spathodea campanulata*

Description, utilization, knowledge, and practices: It is a tree that grows between 7 m and 25 m (23–82 ft) tall and is valued for its timber used as firewood, fodder, and fence [33, 41, 120]. The sap sometimes stains yellow on fingers and clothes. The seeds are used as a poison to kill pests [21]. The stem, bark, and leaves of *Spathodea campanulata* may be crushed and soaked in water or gin and used for the treatment of skin eruption, skin lesions, burns, ulcers, and bruises [8].

Cultivation requirements and management within Akwa Ibom: It is propagated wild by seed.

4.42 *Newbouldia laevis*

Description, utilization, knowledge, and practices: Newbouldia laevis is a fast-growing evergreen shrub or small tree [19]. In Akwa Ibom, the stem, bark, and root are used to prepare concoctions for treating boils, skin lesions, and spots.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.43 *Kigelia africana*

Description, utilization, knowledge, and practices: *Kigelia africana* is a tree grows that bears poisonous fruits and can grow up to 60 cm. The wood of *Kigelia africana* is pale brown or yellowish, undifferentiated, and not prone to cracking. [108]. The stem and bark are used in Akwa Ibom in the treatment of wounds and sore.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.44 *Ananas comosus*

Description, utilization, knowledge, and practices: Ananas comosus is a herbaceous, monocot biennial, or perennial tropical plant that produces fleshy, edible fruits. In Akwa Ibom, it is commonly known as Eyop mbakara. Mature pineapple is used in traditional medicine by mixing the fruit peel with other materials to treat rashes [8] or stomachache.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.45 *Dacryodes klaineana*

Description, utilization, knowledge, and practices: *Dacryodes klaineana* is an evergreen perennial tree known as Eben Ikot in Akwa Ibom. The leaves and roots are used in the treatment of skin spots and rashes.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.46 *Allanblackia floribunda*

Description, utilization, knowledge, and practices: *Allanblackia floribunda* is an evergreen tree, which grows up to 30 m [55]. The seeds are eaten fresh or made into jams and jellies. Stem decoction and leaves are used to treat skin infections.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.47 *Combretum micranthum*

Description, utilization, knowledge, and practices: *Combretum micranthum* is a shrub is known as Asaka in Akwa Ibom. The seeds are edible. Infusions of the leaves are used in the treatment of skin lesions and spots [8].

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.48 *Terminalia ivorensis*

Description, utilization, knowledge, and practices: *Terminalia ivorensis* is known as Nkot ebene in Akwa Ibom. The plant is useful in the treatment of ulcers, cuts, wound sores, body pains, high temperatures, hemorrhoids, and diuresis, as well as malaria and yellow fever [20, 59].

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.49 *Ipomoea quamoclit*

Description, utilization, knowledge, and practices: Ipomoea quamoclit is a herbaceous vine from the family Convolvulaceae known as Ediam ikanikot in Akwa Ibom. The leaves are Poultice and are used traditionally for the treatment of boils and small open injuries.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.50 *Ipomoea pileata*

Description, utilization, knowledge, and practices: *Ipomoea pileate* is an annual or perennial twining herb that grows from a thick taproot. In Akwa Ibom, it is commonly known as Mkpafiafian. The leaves are crushed in water and applied to skin spots.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.51 *Costus afer*

Description, utilization, knowledge, and practices: *Costus afer* is a tall perennial semi-woody herb. In Akwa Ibom, it is generally known as Mbritem and is mostly used for several ailments including arthritis, rheumatism, eye treatments, nasopharyngeal affections, stomach pains and laxatives, sexual stimulants, antidepressants, venereal diseases, febrifuges, leprosy, dropsy, swellings, oedema, and gout stem.

Cultivation requirements and management within Akwa Ibom: It is propagated by seed.

4.52 *Bryophyllum pinnatum*

Description, utilization, knowledge, and practices: *B. pinnatum* is commonly called the resurrection plant or cathedral bells. In Akwa Ibom, it is generally known as Ndodop Afiaiyo. The leaf extract is used for the treatment of kidney stones, ulcers, bacterial and viral infections, asthma, and ulcers. It has analgesic properties, and recent research shows that it has antimutagenic and anticancer properties [127].

Cultivation requirements and management within Akwa Ibom: Propagation is done by seeds. In addition, plantlets arise from the edges of their leaves and take root when it drops on the ground. It requires little care, but during the hot seasons, it should be shielded from direct sunlight or else the leaves will be burned.

4.53 *Citrullus colocynthis*

Description, utilization, knowledge, and practices: *C. colocynthis* is a perennial creeping herbaceous vine commonly found in desert areas. It looks like a watermelon, and common names include bitter apple, desert gourd, bitter apple, vine of Sodom, etc. In Akwa Ibom, it is called Ikon. The seed oil has antioxidant, anticancer, antidiabetic, and insecticidal properties. The fruit is bitter and pungent and used as a purgative, anthelminthic, and carminative cure for tumors, ulcers, asthma, leukoderma, etc. The seeds are crushed and used to clear skin spots and abscesses [2].

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds. It requires good light and good soil-based compost. It requires care only at the initial stage because it thrives in pots and nursery beds at the initial stage.

4.54 *Momordica charantia*

Description, utilization, knowledge, and practices: *M. balsamina* is commonly called an African pumpkin. In Akwa Ibom, it is called Mbiadon Edon. It is a tendril-bearing, wild climber with small lobed leaves, monoecious flowers, and ovoid ellipsoid fruits which are softly warted and fleshy. The leaves, fruits, seeds, and bark contain resins, alkaloids, flavonoids, glycosides, steroids, terpenes, cardiac glycosides, and saponins that are known to have medicinal properties including antiviral, antiplasmodial, antidiarrheal, antiseptic, antibacterial, antiviral, antimicrobial, analgesic, and hepatoprotective properties [40]

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds. Care is required at the initial stage because it thrives better in a nursery.

4.55 *Dioscorea dumetorum*

Description, utilization, knowledge, and practices: *D. dumetorum* is commonly called bitter yam. In Akwa Ibom, it is called Anim. It has distinct trifoliate leaves each having 3–7 veins per leaflet. The vine has ridged ascending prickles and a characteristic twining to the left. The vine grows annually from the underground tubers which are deeply lobed and occur in clusters just below the surface of the soil.

Bitter yam lowers blood sugar level, boosts fertility, reduces inflammation, enhances brain function, and prevents cancer [4].

Cultivation requirements and management within Akwa Ibom: Propagation is by seed or cutting off the tuber, setts, or bulbils. It requires staking for maximum yield.

4.56 *Euphorbia hirta*

Description, utilization, knowledge, and practices: *E. hirta* is commonly referred to as an asthma plant and is a hairy herb In Akwa Ibom, it is called Etinkene ekpo. It exudes white latex as soon as it is cut. It is used as a traditional medicine to treat asthma, skin ailments, and hypertension [110].

Cultivation requirements and management within Akwa Ibom: It goes in the wild.

4.57 *Jatropha curcas*

Description, utilization, knowledge, and practices: *J. curcas* is a semi-evergreen shrub or small tree. In Akwa Ibom, it is called Ukim Eyio. It is used for the treatment of rheumatism, toothache, jaundice, dysentery, and gum bleeding and inhibits HIV by inducing cytopathic effects with low cytotoxicity, etc. [100].

Cultivation requirements and management within Akwa Ibom: It can be cultivated by both seeds or stem cuttings and it needs little management to survive.

4.58 *Manihot esculenta*

Description, utilization, knowledge, and practices: *M. esculenta* is commonly called cassava.

In Akwa Ibom, it is called Iwa.

It is a perennial shrub plant with conspicuous, almost palmate alternate leaves which are deeply parted into 5–9 lobes. It produces elongated tubers. The stems can grow up to 5 m high. It is used to induce labor, treats dehydration in people with diarrhea, and is effective for tiredness and sepsis [11].

Cultivation requirements and management within Akwa Ibom: This is mostly propagated using stem cuttings. To enhance productivity, the stem cuttings must be planted in the right position on flat ground for soft soil and on mounds for hard soil.

4.59 *Manniophyton fulvum*

Description, utilization, knowledge, and practices: *M. fulvum* is a straggling bush or liane and in Akwa Ibom is called Ekonikon. Its stem can be about 30 m long to

10 cm thick. It is used for the treatment of whooping cough, leprosy, dysentery, piles, and painful menses [20].

Cultivation requirements and management within Akwa Ibom: It grows in the wild, although it can be propagated by seed and requires little management.

4.60 *Mallotus oppositifolius*

Description, utilization, knowledge, and practices: *M. oppositifolius* is a shrub or small tree with pale greenish-gray bark which is slightly rough and scaly and covered with mixed simple and stellate hairs [104]. In Akwa Ibom, it is commonly called Uman nwariwa. The leaves are useful for the treatment of epilepsy, diarrhea, inflammation, dysentery, convulsion, pain, etc. [3].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds, although vegetative propagation may be possible given its easy growth. They have a self-supporting growth form and hence do not need much management for survival. Similarly, it grows in the wild.

4.61 *Afzelia africana*

Description, utilization, knowledge, and practices: *A. africana* is a tree in Akwa Ibom called Eyin Mbukpo. The leaves are alternate, petiolated, or paripinnate, up to 30 cm long with 7–17 pairs of leaflets; it has sweet-smelling flowers and produces oblong straight flattened dehiscent pod fruits which are black-brown [27, 34, 92]. The leaves are used for pain relief and treating digestive problems such as constipation and vomiting and internal bleeding.

Cultivation requirements and management within Akwa Ibom: It is propagated by seeds and vegetative techniques through budding. Since the seeds are readily preyed upon by animals, care should be taken for the right depth while planting.

4.62 *Acacia ataxacantha*

Description, utilization, knowledge, and practices: *A. ataxacantha* is a woody, shrub or small tree growing up to 10 m in height. In Akwa Ibom, it is called Mbara Okpok and is used in the treatment of abscesses, backache, cough, dental caries, toothache, pneumonia, malaria, sores, wounds, stomach problems, etc. [61].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds as well as stem cuttings.

4.63 *Afzelia bella*

Description, utilization, knowledge, and practices: *A. bella* is a tall tree. The leaves produce sweet-scented flowers. The ground bark is used for the treatment of topical skin infections. Bark decoctions and macerations are taken to treat intestinal parasites, diarrhea, menstruation problems, rheumatism, and hemorrhoids and can be used as a tonic. Leaves are administered against constipation [71]. It is commonly called pod mahogany and referred to as Enyin Mbukpo in Akwa Ibom.

Cultivation requirements and management within Akwa Ibom: Propagation is via seeds which must be sown no deeper than 2 cm with the hilum facing downward. Little management is required.

4.64 *Baphia nitida*

Description, utilization, knowledge, and practices: *B. nitida* is commonly called camwood and Afuo in Akwa Ibom. It is a shrubby, leguminous, hardwooded tree with evergreen leaves. It can grow to about 4–5 m tall. It has characteristic smooth, green leaves which are oval shaped measuring about 10–15 cm long. It produces flowers that are white and pea-like and have a yellow center. The leaves have inflammatory, antidiarrheal, and analgesic effects. The extract of camwood can be formed into a soft soap-like material that promotes healthy skin [111].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds and cuttings (from young parts). It does not require special management [22].

4.65 *Cajanus cajan*

Description, utilization, knowledge, and practices: *Cajanus cajan* is called Nkoti in Akwa Ibom and is an erect, branched, hairy shrub. The leaves are used for treating diabetes, sores, skin irritations, hepatitis, measles, jaundice, dysentery, stabilizing menstrual period, expelling bladder stones, etc. [126].

Cultivation requirements and management within Akwa Ibom: Propagation is via seeds in holes 2 m apart. The management required constant weeding for the first 2 months.

4.66 *Cassia alata*

Description, utilization, knowledge, and practices: *Cassia alata* is called Adaya Okon in Akwa Ibom. It is an annual shrub or occasionally a biannual herb with zygomorphic flowers. Seed extracts are used to cure skin diseases, while the leaves are used to treat constipation and fresh leaves are applied to the skin to treat fungus [90].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds.

4.67 *Glycine max*

Description, utilization, knowledge, and practices: *Glycine max* is called Nkoti eto in Akwa Ibom. It is an erect, bushy, hairy annual legume. Seeds are used for the prevention and treatment of cardiovascular diseases, diabetes, cancer, obesity, cholesterol, etc. [14].

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds and requires little management.

4.68 *Lonchocarpus cyanescens*

Description, utilization, knowledge, and practices: *Lonchocarpus cyanescens* is a shrub. In Akwa Ibom, it is called Awa. All the plant parts are medicinal and can be used in the treatment of diarrhea, leprosy, yaws, arthritis, rheumatism, genital stimulants, dysentery, etc. [36].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds and it requires little management to thrive.

4.69 *Parkia biglobosa*

Description, utilization, knowledge, and practices: *Parkia biglobosa* is called Ukon Uyayak in Akwa Ibom and is a perennial deciduous tree. It is useful for the treatment of hypertension, wound healing, antimalaria, management of bacterial infection, etc. [53].

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds and it doesn't require special management.

4.70 *Pentaclethra macrophylla*

Description, utilization, knowledge, and practices: *Pentaclethra macrophylla* is called Ukana in Akwa Ibom. It is a large size tree with log bipinnate compound leaves. It has antibacterial and antimicrobial properties, and the seeds are used to treat infertility.

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds and little management is required to make it grow.

4.71 *Pterocarpus erinaceus*

Description, utilization, knowledge, and practices: *Pterocarpus erinaceus* is commonly called bar wood and also known as Ukpa in Akwa Ibom. The leaves are 3–7-cm-long petioles with hairy pinnae. It has a golden yellow flower that grows up to 13 mm long. The fruit is straw colored, circular, flattened, and indehiscent. It has a seeded pod of 4–7 cm in diameter. These pods contain seeds. It is used to treat inflammatory disease, malaria, anemia, ulcer, rheumatism, dermatitis, etc.

Cultivation requirements and management within Akwa Ibom: It is propagated by planting nursery-raised seedlings or rooted cuttings. Careful management is required for its survival before sowing which requires dipping the seeds in water or sulfuric acid for some time. After germination, frequent pruning is required [123].

4.72 *Pterocarpus santalinoides*

Description, utilization, knowledge, and practices: *Pterocarpus santalinoides* is a tree with slash yellowish-white exuding drops of red gum when slashed. It produces fruits that are orbicular with the flattened indehiscent pod which is hairy and pal brown in color. The pods have seeds [58]. It is commonly called Mututi in English and Nkpa-inyan in Akwa Ibom. It is used for the treatment of gastroenteritis.

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds.

4.73 *Tetrapleura tetraptera*

Description, utilization, knowledge, and practices: *Tetrapleura tetraptera* is commonly called aridan or gum tree in English and Uyayak in Akwa Ibom. It is a single-stemmed, robust, perennial tree [54]. It is used for the treatment of diabetes, hypertension, asthma, epilepsy, schistosomiasis, arthritis, etc.

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds that require scarification for germination due to their hard coats.

4.74 *Harungana madagascariensis*

Description, utilization, knowledge, and practices: *Harungana madagascariensis* is called Oton in Akwa Ibom and is a small bushy tree. It produces almond-scented white or cream flowers and globular berry-like small fruits [16]. It is used in the treatment of chest pain, urogenital infections, ringworm, eczema, malaria, etc.

Cultivation requirements and management within Akwa Ibom: Propagation is by seeds and it requires thinning after planting to enhance growth.

4.75 *Irvingia gabonensis*

Description, utilization, knowledge, and practices: *Irvingia gabonensis* is commonly called Uyo in Akwa Ibom. It is useful for weight loss and treatment of high cholesterol and diabetes [18].

Cultivation requirements and management within Akwa Ibom: Cultivation is by seeds.

5 Conclusion

The plants documented here are regularly used by Akwa Ibom people as food and medicine despite the lack of any elaborate institutional effort to manage, protect, and conserve the genetic resources. The food and medicinal benefits of these plants are linked to the phytochemical composition and non-secondary metabolites that are bioactive at different levels because their ingestion in diverse forms influence biological processes. This is unsustainable because of the ongoing biodiversity loss, climate change, and sociocultural transitions away from traditional past and calls for formal management strategies. Knowledge about the food and medicinal values of these plants are mostly held by community elders, village heads, chiefs, head of households, academics, researchers, and traditional medical practitioners. There is a need to undertake the collection, characterization, and conservation of the plant resources recorded in here to protect them from ongoing changes and ensure future generations can benefit from these resources. By documenting the relevant information connected to the utilization and cultivation of these plant resources as well as encouraging their cultivation on large scales, employing the use of plant breeding programs for better qualities and employing the use of conservation methods for all varieties, these resources and their inherent values can be saved

Abstract

This chapter discusses the diversity and classification of medicinal plants. Medicinal plants occupy a place of prime importance due to their complementary applications in modern medicines, and their use as food supplements, nutraceuticals, pharmaceutical intermediates, folk medicines, and secondary metabolites they provide for novel drugs. Therefore, an understanding of the diversity and classification of medicinal plants is useful for practitioners of ethnomedicine, botanists, and the common man for home remedies. Medicinal plants are mostly either angiosperms or gymnosperms with about 4171 and 706 plant species, respectively. Among angiospermic medicinal plants, dicotyledons have the most common representation of medicinal plants. Medicinal plants may be classified based on the following; parts used, habitat, habit, therapeutic, and ayurvedic formulations. The majority of medicinal plants are herbaceous, and about 51.3% grow mainly in the wild. Tropical rain forest provides the highest percentage of species (54.6%), followed by home gardens (25.4%) and unused land (19.5%). The medicinal use of about 72 (38.5%) plants has not before been reported. Many medicinal plants and their related indigenous values have not been adequately documented despite numerous investigations on medicinal plant products. The bulk of plant parts utilized in phytomedicine are the leaves (145 species), followed by the roots (119 species), and the stem (53 species). Herbs make up the highest percentage of species in terms of habit (44%), followed by trees (26%), shrubs (16%), lianas (5%), and others. Also, the sustainable use of medicinal plants should be ensured, and thorough documentation of the traditional knowledge linked with their usage should also be made and passed down across generations.

1 Introduction

A medicinal plant can be any plant in which one or more of its components contains bioactive substances, which can be utilized therapeutically or as precursors to the manufacture of valuable pharmaceuticals. Since time immemorial, natural plant products have occupied a place of prime importance in the field of medicine. They continue to be vital to many who do not have access to modern medicines or cannot afford synthetic drugs. Medicinal plants, for example, herbs and trees contain chemical compounds known to modern and ancient civilizations for their bioactive properties. Until the development of chemistry, particularly, the synthesis of secondary metabolites in the nineteenth century, medicinal plants and herbs have been the sole source of bioactive compounds capable of healing human ailments. Researchers believe that if medicinal herbs are taken in the appropriate doses and forms, they will be more effective than modern pharmaceutical drugs (synthetic drugs).

Plant products contain secondary metabolites that heal a variety of ailments and conditions in humans and animals. Over 75% of the world's population relies mainly on plants and their products for primary healthcare. Approximately 30% of all plant species were used for medical purposes at some point in history [1].

In developed nations like the United States, it has been estimated that up to 25% of all medications are made from plants. Fast-developing nations like China and Singapore make up as much as 80% of the total. As a result, countries like China use medicinal herbs for economic purposes considerably more frequently than the rest of the globe. Indigenous systems of medicine are employed to treat rural people, and these nations contribute two-thirds of the botanicals used in contemporary medical practices. Over 80,000 of the 250,000 higher plant species that exist on Earth are used for medicinal purposes [2].

Medicinal plants are plants that have the potency in the treatment of illnesses and the prevention of specific problems and diseases that impact both humans and animals. There are other varieties of herbal treatments that may differ from region to region, producing a similar pattern of "size" and "shapes." Natural plants have excellent secondary metabolites or chemical properties from their roots down to leaves even in their saps. Leaves of some herbs, for example, Karpooravalli (*Coleus ambonicus*), Bitter leaf (*Vernonia* species), Podina (*Mentha arvensis*), finger root (*Uvaria chamae*), Neem (*Azadirachta indica*), Thudhuvalai (*Solanum trilobatum*), Fern (*Diplazium sammatii*), Basil (*Ocimum sanctum*) and some edible species of fungi (mushroom), etc., are used by humans today. Some leaves have secondary metabolites that treat skin conditions, colds, headaches, constipation, and indigestion, among other conditions. Therefore, plants used for their specific health benefits to both human and animal health are considered medical plants [3, 4].

A significant number of plants are rarely used whole; at least one of its parts (leaf, stem, root, rhizome, bark, seeds, buds and leaves, etc.) can be utilized medicinally. The value of other parts of the same plant can vary. Plants that produce secondary metabolites can also be utilized as food, condiments, or even for purifying drinks. Since the beginning of time, the theory of signatures, which was systematized in the sixteenth century, has been essential and significant in the distinction by analogy of plants useful for human healing. From the seventeenth century, however, it has been expanded, contested, and canvassed, and by the eighteenth century, the elite community has completely abandoned it. According to data on plant use around the world, 14–28% of plants are included for their therapeutic properties. According to twenty-first-century surveys, 3–5% of patients in Western nations, 80% of local inhabitants in poor nations, and 85% of populations in the Southern Sahara chose medicinal plants as their primary form of treatment [2, 5].

There are still many people who practice traditional medical approaches. According to estimates, 80% of the world's population, or about four million people, cannot afford the goods produced by the Western pharmaceutical sector. They have to rely on the use of conventional medications, many of which have botanical origins. The inventory of medicinal plants, which includes over 20,000 kinds of plants, provides extensive documentation of this fact. Despite the overwhelming influence, reliance, and technological advancements in synthetic medications, a sizable portion of the global population still favours drugs derived from plants due to their accessibility and lower cost.

This chapter seeks to discuss the methods of classification of medicinal plants. We will also give details on their diversity, usage, formulation, habits, nutrition, habitats, nature, size, life span, as well as their therapeutic values.

1.1 Medicinal Plant Species and Their Therapeutic Value

Different plant groups have different medicinal plants that are synonymous to these groups depending on the number of species that belong to the said group. A breakdown of the different plant groups as well as the total number of species is given in Table 1. These plants and their bioactive components have been exploited

Table 1 Plant species with therapeutic value under different plant groups

Different plant groups	Number of plant species
Angiosperms:	
Monocotyledons	676
Dicotyledons	3495
Gymnosperms:	
Thallophytes	250
Bryophytes	54
Pteridophytes	402
Total	**4877**

Source: [6]

Table 2 Plant species, drugs, and their uses

Plant Species	Drugs	Uses
Catharanthus roseus	Vinblastine	Anti-cancer
Tradescantia spathacea	Taurine	Anti-inflammatory
Catharanthus roseus	Ajmalacine	Anti-cancer, hypotensive
Erythroxylum coca	Cocaine	Local anaesthetic
Rauvolfia serpentina	Rescinnamine	Tranquilizer
Rauvolfia serpentine	Reserpine	Tranquilizer
Papaver somniferum	Codeine	Anti-tussive
Cinchona species	Quinine	Antimalarial, amoebic dysentery
Erythroxylum coca	Cocaine	Tropical anaesthetic
Papaver somniferum	Morphine	Painkiller
Colchicum autumnale	Colchiceine, Amide	Anti-tumour
Xanthium strumarium	Tomentocin	Anti-sedative
Papaver somniferum	Codeine	Anti-cough
Digitalis species	Cardiac glycosides	Congestive heart failure
Artemesia annua	Artemisinin	Anti-malarial
Plumbago indica	Plumbagin	Anti-bacterial, antifungal
Gossypium species	Gossypol	Anti-spermatogenic
Allium sativum	Allicin	Anti-fungal
Xanthium strumarium	Xanthinin	Hair growth
Ricinus communis	Ricin	Anti-fungal
Digitalis thevetia	Digitoxin, Digoxin	Cardiotonic
Thevetia species	Nerrifolin	Cardiotonic
Podophyllum emodi	Podophyllin	Anti-cancer
Aspilia Africana	Aspicine	Wound healing
Musa parasidiaca	Musadine	Cuts and sores
Sesamum indicum	Sesamin	Anti-anaemic
Tithonia diversifolia	Tithonine	Skin diseases
Senna occidentalis	Carfeine	Pain relief
Tinospora cordifolia	Tinosporone	Anti-rheumatism
Eryngium foetidium	Arialgeine	Analgesic and inflammation
Colchicum autumnale	Colchicine	Anti-tumour, anti-gout

Sources: [7–10]

by pharmaceutical companies for many years now to produce drugs with several benefits, some of which are listed in Table 2.

2 Methods of Classifying Medicinal Plants

It has been estimated that there are 250,000 species of higher plants on earth; more than 80,000 species have at least some known medicinal uses. There are around 5000 species with specific medicinal benefits. They are classified according to: parts used, habit, habitat, therapeutic value, and Ayurvedic formulation [3, 9, 10].

2.1 Some Medicinal Plants Based on Parts Used

The following are some medicinal plants used based on their parts:

Whole plant: *Boerhaavia diffusa, Phyllanthus neruri, P. amarus, Euphorbia hirta*
Rhizome: *Curcuma longa*, *Zingiber officinale*
Roots: *Uvaria chamae, Daucus carota, Nuaclea latifolia*
Stem: *Tinospora cordifolia, Acorus calamus*
Bark: *Saraca asoca, Manifera indica, Azadiractita indica, Persea americana*
Leaf: *Indigofera tinctoria, Lawsonia inermis, Aloe vera, Sesamum indicum, Centalla asiatica*
Flower: *Biophytum sensitvum, Mimusops elenji*
Fruit: *Aframumum melequeta*, *Solanum* species, *Psidum gaujava, Cucumis melo*
Seed: *Datura stramonium, Cola nitida, Cola acuminata, Persea americana*

2.2 Some Medicinal Plant Based on Habit

The following are some medicinal plants used based on their habits:

Grass: *Cynodon dactylon*
Sedge: *Cyperus rotundus*
Herbs: *Vernonia cineria, Emilia sonchifolia*
Shrubs: *Solanum* species, *Capsicum* species
Climbers: *Asparagus racemosus, Dioscorea* species, *Phildendron domesticum, Cleome ciliate, Smilax anceps*
Creeper: *Commelina erecta, Commelina begalensis, Ipomoea batatas, Ipomoea cordatotriloba*
Trees: *Azadiractita indica, Mangifera indica, Dacroydes edulis, Croton* species.
Lianas: *Heinsia bussei, Tetracarpidium conophorum*

2.3 Some Medicinal Plant Based on Habitat

The following are some medicinal plants used based on their habitats:

Tropical: *Andrographis paniculata*
Sub-tropical: *Mentha arvensis*
Temperate: *Atropa belladona*

2.4 Some Medicinal Plant Based on Therapeutic Values

The following are some medicinal plants used based on their therapeutic values:

Anti-malaria: *Cinchona officinalis, Artemisia annua*
Anti-cancer: *Catharanthus roseas, Taxus baccata*
Anti-ulcer: *Azadirachta indica, Viscum album*
Anti-diabetic: *Catharanthus roseus, Musa acuminata, Dioscorea bulbifera*
Anti-cholesterol: *Allium sativum*
Anti-inflammatory: *Curcuma domestica, Desmodium gangeticum, Eryngium foetidum*
Anti-viral: *Acacia* species
Anti-bacterial: *Plumbajo indica*
Anti-fungal: *Allium sativum*
Anti-diaharrhoeal: *Psidium guajava, Curcuma domestica*
Anti-hypertensive: *Allium sativum, Persea appericara*
Anti-cardiotonic: *Digitalis* species*, Telfairia occidentalis, Peristrophe bicalyculata*

2.5 Medicinal Plant Based on Ayurvedic Formulation

This type of medicine is practiced in some parts of the world specifically in India, for example, *Desmodium gangeticum*, *Solanum indicum, Gmelina arborea, Premna spinosus, Ipomoea maxima, Emilia sonchifolia, Cardiospermum halicacabum, Ficus racemose, Ficus microcarpa, Phyllanthus emblica, Terminalia bellerica*.

3 Diversity in Medicinal Plants

Plantae as a Kingdom has existed for about 410 million years as green algae evolve from water to land, medicinal plants included. The land is a rich resource of medicinal plants and was comparatively not colonized. However, terrestrial habitats give more light and carbon dioxide needed by plant for growth and survival.

Medicinal plants are multicellular and mostly photosynthetic and may be terrestrial or aquatic and some are epiphytic or ephemeral. Medicinal plants can be found almost in all habitats on Earth.

According to research carried out at the Botanical Garden in the main campus of Akwa Ibom State University at Ikot Akpaden, Mkpat Enin Local Government Area of Akwa Ibom State – Nigeria by Okon et al. [11]. The Garden has a rich floral diversity of medicinal plants that have been conserved for the past ten years both in situ and ex situ mainly for research purposes. According to Sikolia and Omondi [12], the preservation of plants in botanical gardens dates back to the beginning of time. According to Botanic Garden Conservation International (BGCI), a botanic garden is an establishment that is accessible to the general public for assessment and evaluation, has a respectable level of permanence, and conducts scientific or technical research on plants (including species of wild origin) in its collections that are used for medicinal, ornamental, cultural, or other purposes. The Botanical Garden of Akwa Ibom State University (AKSU), Nigeria, was the site of a study by Okon et al. [11] that indicated the percentage habits of medicinal plants found in the highlighted

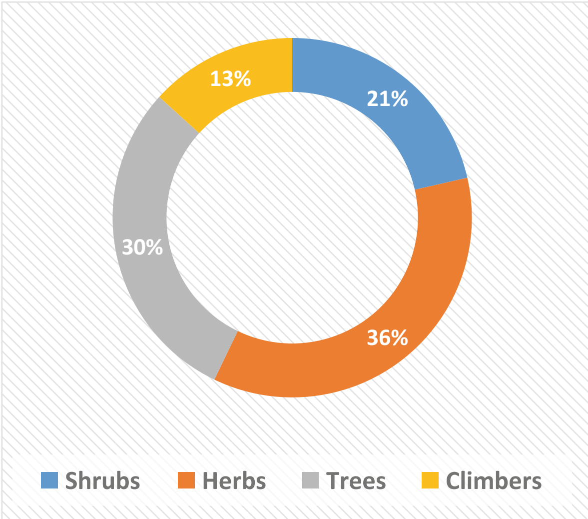

Fig. 1 Percentage distribution of medicinal plants habits in AKSU Botanical Garden, Nigeria [11]

area of the AKSU botanical garden examined documented diversity of medicinal plants based on their habits as follows: herbs as highest (35.71%), trees follow with 29.59%, then shrubs with 21.43%, while climbers were the least with 13.27% (Fig. 1).

Medicinal plant diversity can also be attributed to how well protected they are. To determine the condition of their conservation, the total number of plant species discovered in the AKSU Botanical Garden were cross-checked on the websites of two conservation organizations: the International Union for Conservation of Nature (IUCN) and Natural Resources/Nature Serve. Research indicates that 42.86% of the medicinal plants identified at the AKSU Botanical Garden are assessed as least concern/secure and face minimal risk, while 52.04% are rated as data deficient/ unranked. Near threatened species were recorded at 4.08% and 1.02% susceptible [11].

3.1 Medicinal Plant Diversity Based on Their Habitat

Based on the different characteristics and morphology of plants, there are diverse types of plants. Medicinal plants are grouped into the following categories according to their habitat [13, 14].

3.1.1 Hydrophytes

The word hydrophytes means plants that grow near water or in. These plants have weak vascular tissue (xylem and phloem), soft stems, and poor root systems. Here the majority of the tissue has air spaces and is spongy.

Hydrophytic Plants Include the Following Characteristic Features

a. Submerged plants, for example, *Elodea*, *Hydrilla*, *Sphgnum*, *Zostera*, *Vallisneria,* and *Potamogeton*, etc.
b. Fixed-floating and free-floating, for example, *Eichhornia, Utricularia*, *Wolffia, Salvinia, Egeria, Lemna, Ceratophyllum, Pistia*, *Trapa,* and *Eichornia,* etc.
c. Amphibious, that is, partly submerged, for example, *Sagittaria*, *Ranunculus aquatilis,* and *Alisma plantago*, etc.). Two angiosperms that are also marine, for example, *Thalassia* and *Zostera*.

3.1.2 Hygrophytes

Hygrophytic plants require wet, dark, and moist surroundings to develop and grow. Their fragile, spongy stems and root systems limited growth. Their leaves are completely formed and have stomata. Examples of common plants are several types of grasses, ferns, and begonias [6].

3.1.3 Halophytes

Halophytes are plants that can thrive in salty environments like soil or water. They can adapt or withstand high salt concentrations, such as those of NaCl, MgCl2, and MgSO4, quite well. They possess peculiar, negatively geotropic breathing roots known as pneumatophores, such as *Rhizophora racemosa, Rhizophora mangle Ceriops,* and *Avicennia* etc., which are some common examples.

3.1.4 Mesophytes

Mesophytes are mostly angiosperms that thrive in environments with little or moderate water supply. They always grow bigger and faster. They also have a strong root and leaf system. Both woody and herbaceous stems are possible. Some of them grow mesophytically in the summer and xerophytically in the winter, much like deciduous trees.

3.1.5 Xerophytes

Most xerophytic plants are medicinal. Examples include *Ziziphus*, *Nerium, Acacia, Euphorbia, Amaranthus, Argemone,* etc. These plants do well in xeric, arid, or places with insufficient water availability. Due of their ability to store water in their stems, many xerophytes are succulents like *Opuntia*, leaves like *Bryophyllum* species, and *Agave* or roots, for example, *Asparagus* species [7].

3.1.6 Epiphytic Plants

These plants can be found growing as an epiphyte on trees or on the trunks or branches of other plants, such as orchids or lichen like *Mangifera indica, Persia americana, Citrus* species, *Kola* species, and *Pterocarpus* species, etc. Epiphytic plants are thought of as the parasitic space occupants on other plants. The interaction between an orchid, a commensal, and a tree, the host, is an illustration of commensalism where the host is unharmed [13].

3.1.7 Parasitic Plants

Parasitic plants such as *Cuscuta, Nuytsia floribuda, Monotropa uniflora, Castilleja,* and *Striga* are parasites that grow on other plants on the roots of *Sorghum bicolor* (jowar). They produce a specialized structure mainly for feeding called haustoria that form a functional cap between the two plants.

3.2 Medicinal Plant Diversity Based on Habit

Medicinal plants in the group of angiosperms are categorized into four different groups depending on their form, shape, and size [14, 15].

3.2.1 Herbaceous Plants

These are plants with short, green, and soft stems. Usually with a brief or short life span like wheat or gram. Many herbaceous plants have a much-reduced underground stem portion, but the aerial branch with flowers at the apex develops from the underground part during reproduction. Such a stem is recognized as a scape, for example, *Allium cepa* (onion) and *Allium sativum* (garlic) in the family Amaryllidaceae [7].

3.2.2 Shrubby Plants

Shrubby plants are more advanced and significantly woody with branches than herbaceous plants. They lack an axis but generally have multiple stems, common examples are Ixora dwarf, black kodia, *Schefflera*, henna, roses, and China roses [16].

3.2.3 Arborescent (Trees)

They are usually taller than bushes with thick, rigid, and woody. Arborescent have a noticeable trunk, for example, *Irvingia* species, *Khaya* species, *Hura crepitans*, *Garcinia* species, and *Musanga cecropioides*.

3.2.4 Culms

The nodes and internodes in culms are very apparent. Most plants in these groups have hollow internodes. A typical example is *Bambusa vulgaris* (bamboo), which are grasses but cannot be classified as herbs, shrubs, or trees, etc.

3.2.5 Flowering Vine

These are very weak stem plants, normally supported by another plant. Common examples are Wisteria, Kiwifruit, ivy, and morning glory, etc.

3.3 Medicinal Angiosperm Diversity Based on the Nature of Stem

Some medicinal plants under angiosperm can be grouped based on the type of stem they possess [14, 15].

3.3.1 Erect Stem

Plants in this group develop upright/upward with hard or strong stems. Based on their strong stems, most trees, shrubs, and many herbaceous plants can stand upright on the ground without any support from another plant. Such plants include *Terminalia catappa*, *Terminalia ivorensis*, *terminelia superba*, *Irvingia* species, *Khaya* species, *Hura crepitans*, *Garcinia* species and *Musanga cecropioides, Hibiscus rosa-sinensis, Zea mays,* and *Lysimacchia vulgaris,* etc.

3.3.2 Creepers

Here, the plant's stem dangles and creeps on the ground, and the roots grow from the nodes (i.e., leaves come from nodes) of the culm from which the branches emerge. Consider strawberries and grasses (Cynodon and Oxalis). Adventitious roots are created by the nodes and the length of the stem.

3.3.3 Trailers

Trailers resemble creepers, they do not grow adventitious roots at nodes. There are two different kinds of trailers: Prostrate/procumbent – the stem creeps on the ground, as in the case of *Evolvulus, Tribulus,* or Decumbent – when the prostrate stem extends its tip, as in the case of *Portulaca* and *Linderbergia.*

3.3.4 Climbers

These plants have long, weak stems and are equipped with roots, petioles, spines, and tendrils that allow them to climb or attach themselves to other plants or objects for support. They are of three different types: **Rootlet Climbers** – Roots are produced at the nodes to assist in climbing the object, for example, *Tecoma*, *Pothos,* and *Piper betal* (pan). **Hook Climbers** – *Bougainvillea*, *Duranta,* and *Carrisa* species where the thorns are the modification of an axillary vegetative bud which helps in climbing. Unlike in *Bignonia*, the terminal leaflet is modified into a hook which helps in climbing, **Tendril Climbers** – The tendrils here are thread-like in structure which helps the plant in climbing, for example, *Lathyrus sativus*, *Pisum sativus*, *Clematis*, *Nepenthes*, *Smilex*, *Gloriosa*, *Antigonon*, *Vitis,* and *Passiflora,* etc. [16].

3.4 Medicinal Plant Diversity Based on Size

The medicinal angiosperm plants come in a wide range of sizes. The smallest angiosperm medicinal plant is the rootless aquatic plant *Wolffia*. It has a diameter of roughly 0.1 mm. Aquatic *Lemna* has a diameter of roughly 0.1 cm. With a height of more than 100 metres, the *Eucalyptus regnans* tree is the tallest angiosperm medicinal plant. Some eucalyptus trees can reach heights of 130 metres. The largest plant species is the banyan tree (*Ficus bengalensis*). It can cover a space of between two and five acres and contains more than 200 prop roots.

3.5 Medicinal Plant Diversity Based on Life Span

Based on life span, angiosperms are categorized into the following four groups [14].

3.5.1 Ephemerals

These types of medicinal plants reach the end of their life span relatively quickly before the start of the true dry season. These plants, such as *Argemon Mexicana, Cassia tora*, and *Solanum xanthocarpum*, among others, are not genuine xeric and are frequently referred to as drought evaders, escapers from drought, or drought avoiders.

3.5.2 Annuals

As soon as they have finished their life cycle within a year, medicinal plants like *Oryza sativa* (rice), *Triticum aestivum* (wheat), and Cicer arietinum (gramme), among others, die.

3.5.3 Biennials (Biannuals)

These classes of medicinal plants finished their entire life cycle in two years. Only the first year after planting do they show signs of vegetative development; the following year, they begin to produce flowers, fruits, and seeds as well as attain full maturity. These plants are typically herbs, such as carrot, turnip, and radish plants.

3.5.4 Perennials

Perennial medicinal plants can live for more than 200 years. The Kolkata Botanical Garden is home to a massive banyan tree (*Ficus bengalensis*). A *Ficus religiosa* that can be found in Gaya is about 2500 years old. After reaching full maturity, a large number of medicinal perennials bloom and bear fruit during a particular time of the year. They are polycarpic and include *Mangifera indica*, *Acacia* species, and *Cocos nucifera*. Some perennial medicinal plants, such as *Agave* (Agarvaceae) and *Bambusa vulgaris* (Poaceae), are monocarpic, meaning they only bear fruit once in their lives. All annuals and biennials are monocarpic [16].

3.6 Medicinal Plant Diversity Based on Nutrition

Based on their method of nutrition, medicinal plants in this category are separated into the following groups [14].

3.6.1 Autophytes/Autotrophs

They produce their own food. They are divided into two groups: chemotrophs, which use chemical energy to manufacture their food, and phototrophs, which use sunlight to perform photosynthesis to generate their food.

3.6.2 Heterotrophs

Here, plants are unable to produce their own food and must rely on external sources. Heterotrophs can be insectivorous, saprophytic, parasitic, or symbiotic. Other plant varieties include Polygamous plants, for example, *Mangifera indica*, Stolon plants, for example, *Ajuga*, *Stachys,* and *Mentha*, seedless vascular plants, sucker plants, for example, red raspberry, lilac, and *Forsythia*, air layering plants, for example, *Forsythia*, jasmine, *Hamamelis,* and *Philodendron,* cutting plants. There are different kinds of medicinal plants, and each one needs a certain setting in order to grow and propagate. The essential elements are sunlight, nutrients, water, air, soil, and temperature that plants rely on for their life, germination, growth, development, and full maturity [14–16].

3.7 Diversity in Frequency of Occurrence and Relative Density of Medicinal Plants

The frequency of occurrence and relative density of some medicinal plants found/ grown in Uyo Local Government Area, Nigeria; *Cleome ciliata, Diplazium sammatii, Hibiscus rosa-sinensis, Justicia insularis,* and *Sesamum indicum* each had the highest frequency of occurrence of 60% each while medicinal plants such as *Bombax buonopozense, Glyphaea brevis, Heinsia bussei, Talinum triangulare,* and *Vernonia polysphaera* had the least frequency value of 20% each. In density value, *Cleome ciliata* dominated (8000 plants/ha) while the lowest value was associated with *B. buonopozense* (40 plants/ha) as reported in Table 3 by Okon [17].

In Ikot Ekpene Local Government Area, Nigeria (Table 4), *Justicia insularis, Lasienthera africanum, Microdesmis puberula,* and *T. triangulare* had the highest frequency of occurrence of 60% each while species like *B. buonopozense, Curcubita maxima, D. samamatii, Pterocarpus mildbraedii*, *Vernonia amygdalina,* and *V. polysphaera* had the lowest frequencies of occurrence (20%). *D. sammatii* and *Pterocarpus mildbraedii* had the highest and lowest density values of 1200 plants/ha and 40 plants/ha, respectively. The frequency occurrence of medicinal plants in Eket Local Government Area as shown in Table 5 revealed that *Glyphaea brevis* had the highest frequency of occurrence (80%) while the least frequency was associated with species like *Amaranthus hybridus* (20%), *C. ciliata* (20%), *D. sammatii* (20%), and *M. puberula* (20%). *S. indicum* had the highest density value of 4200 plants/ha while *B. buonopozense* had the least density value of 40 plants/ha. Also, the results revealed that *Gnetum africanum* was near threatened. Threats that affected the medicinal plants were as a result of agricultural activities, aquaculture, food value, construction, and urbanization (Tables 3, 4 and 5) [17].

3.8 Diversity in Use-Value Index of Medicinal Plants in Akwa Ibom State, Nigeria

The use-value index was determined based on the different categories for a particular medicinal plant. Results obtained showed a high index for the following medicinal

plants: *T. triangulare, V. amygdalina, P. guineense, P. mildbraedii, L. africamum, J. insularis, G. fricanum, C. maxima, A. hybridus,* and *T. occidentalis* while the least use-value was recorded in *M. puberula, B. buonopozense, S. tragacantha, G. brevis, H. bussei* and *V. polysphaera*, *C. ciliata,* and *D. sammatii.* Also, all the ten medicinal plants selected for analysis were observed to be available in the wild except *H. rosa-sinensis* (Table 6) [17].

3.9 Medicinal Plants Diversity Among Tree Canopies

Most temperate moist forests in different regions are home to a variety of flora that are pivotal in sustaining the livelihoods of the local plant communities. The abundance and distribution of plant life in these forests, particularly medicinal species, is comparatively underreported (with scant or no supporting documentation). Zubair et al. [18] identified a total of 45 species from 34 different groups in their study site in North-Eastern Pakistan. The majority of plants were identified as being medicinal (45%), followed by food (26%) species that also included some medicinal components. Based on richness and abundance, tree canopy cover has an impact on the general growth of ethnomedicinal plants. In comparison to open spaces and closed canopy, the site with partial canopy showed the highest diversity, richness, and dominance. These results are crucial in revealing the abundance of medicinal flora variety in the Balakot temperate forest in the north-east and the potential for preserving the native plant communities' means of subsistence through public–private collaborations in several sectors.

It has been observed that the diversity of vegetation has a direct impact on the biogeochemical cycles, ecosystem processes, and vegetation structure of a particular ecosystem [19, 20]. Statistics on plant biodiversity in mountainous areas offer vital information and insight on the suitability of the particular habitat, ecosystem productivity, and successional pathway prediction [21–23].

The engine room and hotspots of plant diversity, metabolic processes, ecological zones, and contacts between creatures and the atmosphere are thought to be found under forest canopies [24]. The maintenance of biodiversity and meeting multiple environmental needs are both dependent on the canopy cover of the forest stand [25, 26]. Nearly 40% of the world's current plant and animal life is supported by various forest canopies, of which 10% are recognized as canopy authority [27]. Different strata of medicinal plant species rely on forest canopies for sunlight, nutrients, and assistance with reproduction. According to research, the density and quantity of understory vegetation are directly impacted by disturbance in the various layers. In a forest's understory vegetation, medicinal plants play a crucial function [28, 29]. Holscher and Adnan [30] evaluated the variety and abundance of medicinal plants in old growth forest and degraded forest, reporting that the density of medicinal plants in old growth forest was significantly higher than that in the latter.

Furthermore, it was noted that the quantity of quantitative vegetation surveys in the Himalayas is extremely little and insufficient to draw a precise picture of the diversity of understory vegetation [30, 31]. For the purpose of developing strategies

and employing sustainable management techniques, it is critical to document the variety of vegetation, particularly the situation of medicinal plants in the area. It is important that these untamed and priceless resources are well-maintained because a large section of the forest communities rely on them for economics, food, construction, and medical uses, as well as the restoration of ecosystem functions and biodiversity. Similar to this, there are not many studies on how various forest canopies affect the variety of medicinal plants. In numerous studies, the biodiversity of diverse medicinal plants in the chosen forest is portrayed, as well as the impact of different canopies on the variety and abundance of the medicinal plants. Despite the fact that there are many studies emphasizing the importance and diversity of medicinal plants in many places, this research offers a new dimension to our understanding of how differing forest canopies affect the variety, distribution, and abundance of medicinal plants.

3.10 Medicinal Plant Cover and Abundance Between the Various Forest Canopies

Research revealed that the comparison of the different forest canopies reported that the partial canopy had 65% medicinal plants as the maximum number, followed by the closed canopy with 56% and 41% for open spaces.

3.11 Types of Medicinal Plant Canopy

3.11.1 Closed Canopy

The closed canopy recorded about 56% of medicinal plant species identified and classified as extremely important medicinal plants, in which the most dominant one was *Valeriana wallichii* (Frequency (F) = 100%; Density (D) = 173). *Perilla frutescens* was the second medicinal plant species that was significantly present (F = 70%; D = 113). *Geranium wallichianum* (F = 60%; D = 56), a threatened and endemic medicinal plant (Zubair et al. 2021). Infrequent medicinal plants species were also recorded, the most treasured of which was *Podophyllum hexandrum* Royle (F = 10%; D = 1). Some edible plants of about 25% were noted and the most prominent was *Potentilla indica* (Andrews) T. Wolf having the maximum F and D (F = 100%; D = 320). Other medicinal plants such as *Viburnum grandiflorum* Wall. (F = 10% D = 2) and *Dryopteris filix-mas* (L.) Schott (F = 20% D = 18) were not quite as abundant (Table 7).

3.11.2 Open Spaces

Zubair et al. [18] reported the frequency (F) and Density (D) of the vegetation in the open space to be little to no different when compared to the closed canopy. The difference was that the open spaces were the representation of grasses and forage with 47% in the majority that were utilized by the grazing community. The most abundant of medicinal plants were *Chrysopogon gryllus* (F = 70%; D = 171), *Trifolium repens* L. (F = 60%; D = 185), *Gladiolus communis* (F = 50%;

Table 7 Species and classification in closed canopy in Naga forest

Species	Classification

D = 37), *Primula denticulata* (F = 30%; D = 11), *Cyperus rotundus* (F = 30; D = 46). Plants species showing medicinal characteristics (some chemical constituents) were also represented in this paper, having about 41% of the species, *Hypericum perforatum* (F = 30%; D = 41) being the most prominent and important followed by *Plantago ovata* (F = 20% D = 21) and *Rumex nepalensis* (F = 20%; D = 13), others were quite rare, having minimum frequencies and densities. Edible vegetables were not very dominant and hence were sparsely scattered around different canopies. Among the edibles, only *Potentilla indica* (F = 40% D = 56) had considerable representation (Table 8).

3.11.3 Partial Canopy

Partial canopy cover depicted a different trend away from open and closed spaces and recorded the greatest number of medicinal plant species. The maximum number of medicinal plants was 65%, the most dominant species being the *Mentha spicata* (F = 50%; D = 41) followed by *Polygonum amplexicule* (F = 30%; D = 55) and *Skimmia laureola* (F = 20%; D = 58), while the other 52% of the medicinal plant species were quite rare and were not uniformly distributed in the canopy [18]. Among the rare species, the most important medicinal plant species present in the canopy were *Paeonaia emodi* (F = 10%; D = 35), *Berberis lycium Royle* (F = 10%; D = 1), *Asparagus racemosus* (F = 10%; D = 14), and *Geranium wallichianumi* (F = 10%; D = 40). As compared to the closed canopy-covered site, this area had quite a few varieties of grass species, the most dominant being the *Chrysopogon gryllus* (F = 100%; D = 150) and *Trifolium repens* (F = 40%; D = 244). In this site, a few edible species were represented. A quite popular edible plant, *Potentilla indica* (F = 80%; D = 299), was in abundance when compared to other edible vegetables while other important edible plants such as *Dryopteris filix-mas* (F = 10%; D = 18), *Phyllanthus niruri* (F = 10%; D = 14), and *Solanum nigrum* (F = 10%; D = 16) were quite rare as assessed in the canopy (Table 9).

Table 8 Species and classification in open spaces in Naga forest

Species	Classification

4 Conclusion

This chapter has extensively discussed the diversity and different methods of medicinal plant classification. Medicinal plants are plants that have the potency in the treatment of ailments and prevention of certain diseases and conditions which affect humans and animals alike. It is estimated that out of the 350,000 higher plant species on earth, more than 80,000 have medicinal properties. They are classified according to: part use, habit, habitat, and therapeutic value as well as Ayurvedic formulation. Plantae as a Kingdom has existed for about 410 million years as green algae evolve from water to land, medicinal plants included. The land is a rich resource of medicinal plants and was comparatively not colonized. This chapter expounds on the diversity and classification of these medicinal plants to aid understanding and usage of these plants. This chapter has also offered a new dimension to our understanding of how differing forest canopies affect the variety, distribution, and abundance of medicinal plants. Research has revealed that from the comparison of the different forest canopies, the forest ecosystem with the partial canopy had 65% medicinal plants as the maximum number, followed by the closed canopy with 56% and 41% for open spaces. Thus, for the purpose of developing strategies and employing sustainable management techniques in the conservation of medicinal plants, it is critical to document the variety of vegetation, particularly the situation or status of medicinal plants in the area. It is important that these untamed and priceless resources are well-maintained and conserved because a large section of humans living in forest communities rely on them for economics, food, construction and medical uses, as well as the restoration of ecosystem functions and biodiversity.

Acknowledgment The authors wish to thank Mr. Felix Udo and AK18 students of the Department of Botany, Akwa Ibom State University, Ikot Akpaden, Mkpat Enin for their role in the survey of the plants used in some parts of this chapter.

Abstract

In the past decade, there has been an increased concern about the effects of medicinal plants. Traditional medicinal herbs from diverse habitats and locations can be evaluated as novel treatment and prevention methods for injuries and diseases. Natural products, especially secondary metabolites in medicinal herbs, including those utilized in conventional and ethnic health care systems, provide prospective components for developing novel drug candidates. Phytochemicals have many potential roles as they can protect plants from enemies and act as antimicrobial, anti-inflammatory, antidiabetic, and chemopreventive agents. Their identification and classification are usually according to the chemical formula, such as flavonoids, terpenoids, alkaloids, saponins, phytosterols, carotenoids, essential oils, nonessential amino acids, and aromatic and aliphatic acids. Each group has characteristics, including anticancer, anthelmintic, and antigenotoxic. Additionally, they can offer direct/indirect protection against pathogens or hazardous conditions. Due to their potency and cost-effectiveness, phytochemicals have recently received considerable interest in this area. The impact of medicinal plant utilization is international and has been developing in many countries. Notably, as a potential source of alternative treatments, traditional medicine has attracted attention worldwide. This chapter will focus on classifying phytochemicals (primary and secondary metabolites), identifying some active secondary metabolites (such as flavonoids, alkaloids, terpenoids, phytosterols, and phenolic compounds), studying their potentiality in the treatment of some disorders, and the modern research advances in herbal medicine field.

Keywords

Phytochemicals · Herbal medicine · Flavonoids · Alkaloids · Cancer treatment · Antimicrobial properties · Artificial phytochemicals production

Abbreviations

5-FU	5-fluorouracil
ABTS	2,2′-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)
ACE	Angiotensin-converting enzyme
ATP	Adenosine triphosphate
COX	Cyclooxygenase
DPPH	α, α-diphenyl-β-picrylhydrazyl
ECa-09	Esophageal squamous carcinoma cell in the human
ESCC	Esophageal squamous cell carcinoma
HL-60	Promyelocytic leukemia cell line
HNSCC	Head and neck squamous cell carcinoma

IC_{50}	Half-maximal inhibitory concentration
JAK/STAT	The Janus kinase/signal transducers and activators of the transcription pathway
NF-B	Nuclear factor-B
Nrf-2	Nuclear factor-erythroid factor 2-related factor 2

1 Introduction

Phytochemicals (secondary metabolites) are the chemical substances synthesized by the plant through various chemical mechanisms. Most phytochemicals support plants' ability to compete with other plants and provide defense against diseases, herbivores, or abiotic challenges, such as high UV radiation doses. Usually, humans and animals can detect or smell and sometimes taste the secreted phytochemicals. Moreover, phytochemicals contain various chemical constituents, including alkaloids, flavonoids, saponins, steroids, terpenoids, and many other active groups. Plant metabolites can be classified depending on their physiological function in the plant system as follows: (1) Primary metabolites: They are biomolecules that directly affect the metabolism and the development of different species, and they are broadly distributed in plants, thus being appropriate for use as an edible human source. In addition, these primary components (carbohydrates, proteins, lipids, vitamins, and nucleic acid constituents) are produced through a complex system of metabolic processes to fulfill energy demands and serve as precursors for some physiological processes and biochemical synthesis of vital components (secondary metabolites) [1]. (2) Secondary metabolites are derived from the primary metabolites, in particular developmental stages of the plant. These sophisticated compounds have diverse purposes in the plant system (defense against enemies) and potential biological activity, such as medicinal components [2].

The identification and nomenclature of plant species and understanding their relationships to other species are fundamental for many researchers. Moreover, the botanical identification and taxonomic positions of studied plants, especially medicinal herbs, are crucial in the scientific investigation of their therapeutic usage or the foundation of crude pharmaceuticals. Numerous medicinal plants belonging to diverse plant families include Fabaceae, Apiaceae, Apocynaceae, Lamiaceae, Malvaceae, Mimosaceae, Papaveraceae, Phytolaccaceae, Asteraceae, Boraginaceae, Brassicaceae, Caryophyllaceae, Cesalpinaceae, and Cucurbitaceae [3].

Attributed to their significant biological activity, phytochemicals have been used for decades in traditional medicine, reflecting the critical therapeutic benefits of these chemical components [4]. Additionally, different tissues and organs of medicinal herbs may have unique therapeutic characteristics at distinct stages of development [5]. They are involved in valuable industries like pharmaceuticals, cosmetics, and fine chemicals [6].

In this chapter, the classification of some phytochemicals, including main active groups (terpenoids, flavonoids, alkaloids, phytosterols, and phenolic components) are highlighted and their general biosynthesis pathway, their vital activity in the treatment of some diseases, artificial production of secondary metabolites, and some recent advances in their research are presented.

2 Classification of Phytochemicals

The secondary metabolites are very specialized and can be prevalent in several plant species. The complicated combinations of plant secondary metabolites provide distinctive chemical characteristics among the plant classes, which is an essential classification tool for taxonomists [7]. A summary of some active compounds of different medicinal plant species and their potential treatment effects are presented in Table 1.

2.1 Flavonoids

Flavonoids belong to the polyphenol family of plant secondary metabolites, with more than 6,000 structures, widely distributed in various parts of the plant due to the multiple potential benefits provided by the experts that have received significant attention [56]. Like most metabolites described, flavonoids are essential for adapting plants to their environment, helping to cope with biotic and abiotic stresses, and having critical pharmacological activities. The biosynthesis of flavonoids was studied by using many plant species, including *Arabidopsis thaliana*, *Petunia hybrida*, and *Zea mays*. The synthesis of flavonoids begins with the phenylalanine pathway; multiple enzymes are involved, which makes flavonoids one of the rich families in the plant kingdom [57–59]. The basic structure of most flavonoids contains two phenyl rings (A and B), connected by a heterocyclic pyrene ring with an oxygen atom (C-ring) with the general formula of C6-C3-C6 (Fig. 1). Usually, flavonoids are water-soluble metabolites and classified following the position of ring B into isoflavone and other types, while according to the degree of saturation of the central heterocyclic C-ring can be subdivided into seven categories, including flavanone, flavone, flavanonol, flavanol, flavonol, anthocyanidins, and chalcones (Fig. 2) [60].

The most significant flavonoids are quercetin, quercitrin, and kaempferol, which are expressed in about 70% of all plant species. Several flavonoids play a vital role in anticancer and improving cardiovascular health. For example, hesperidin (Hsp) is a vital flavonoid with high anticancer activity. Also, quercetin is an antioxidant flavonoid, improving blood vessel health and reducing cardiovascular disease risk [61, 62].

2.1.1 Isoflavone

The distribution of isoflavone in plants is limited. It is mainly existed in soybean and legumes and known as phytoestrogens. It has a unique structure to other flavonoids; the position of the B ring for isoflavone is in the third place of the C ring, while the B ring is in the second place of the C ring for other flavonoids. Isoflavone has potential

Table 1 Overview of some bioactive secondary metabolites in herbal medicine

Scientific name	Family of the plant	Active chemical compound	Medical importance	Reference
Cajanus cajan	Fabaceae	Hydroalcoholic, cyanidin-3-monoglucoside, longistylin C	Antioxidant, anti-inflammatory activities, anticancer	[8, 9]
Coriandrum sativum	Apiaceae	Linalool, γ-terpinene, and α-pinene	Hepatoprotective	[10]
Calotropis procera	Apocynaceae	Group of cardiac glycosides (calotropin, calactin, and calotoxin)	Anti-ATPase, antidiarrheal, anticonvulsant, and antiviral	[11–13]
Psychotria nervosa Sw.	Rubiaceae	Emetine (emetine dihydrochloride) and cephaeline	Anti-dengue virus infection	[14–17]
Hippeastrum puniceum (Lam.) Kuntz	Amaryllidaceae	isoquinoline alkaloids (9-O-demethyllycoramine, 9-demethyl-2α-hydroxyhomolycorine, lycorine and tazettine)	Antioxidant, antifungal, antiparasitic, and acetylcholinesterase inhibitory activity	[18]
Hymenocallis caribaea (L.) Herb	Amaryllidaceae	Narciclasine and prancristatin	Antineoplastic compounds	[15, 19, 20]
Thespesia populnea (L.) Sol. ex Corrêa	Malvaceae	Thespesenone and dehydrooxoperezinone-6-methyl ether	Antihepatotoxic compounds	[21–23]
Lagerstroemia speciose (L.) Pers.	Lythraceae	Corosolic acid and ellagitannins	Diabetes treatment, antihyperlipidemic, and antioxidant activities	[24]
Persea americana Mill.	Lauraceae	Peptone, b-galactoside, and glycosylated abscisic acid	Hypertension, stomachache, bronchitis, diarrhea, and diabetes	[25]
Cocos nucifera L.	Arecaceae	Folate (vitamin B_9)	Reduce the risk of breast cancer and anemia during pregnancy	[26, 27]
Acorus calamus L.	Acoraceae	β-asarone, eugenol, asaronaldehyde, and acorin	Antidiabetic, anti-obesity, antihypertensive, anti-inflammatory, and anticonvulsant activities	[28–31]
Alstonia scholaris L. R. Br.	Apocynaceae	Ditamine, echitamine, echitenine, alschomine, isoalschomine, tubotaiwine, and N^b-oxide	Anti-ulcer, antirheumatic, carminative, aphrodisiac, and antiperiodic	[32]

(continued)

Table 1 (continued)

Scientific name	Family of the plant	Active chemical compound	Medical importance	Reference
Phyllanthus epiphyllanthus	Phyllanthaceae	Michellamine B (novel alkaloid), gallotannins, and triterpenes	Inhibition of human immunodeficiency virus (HIV), hepatitis B virus, and antibacterial activity against typhoid fever bacteria	[15, 33–35]
Citrus limon L.	Rutaceae	Eriodictyol	Prevention of diabetic retinopathy, antioxidant, anti-inflammatory, and analgesic effects	[36, 37]
Euphorbia hypericifolia L.	Euphorbiaceae	Isomotiol, espinendiol A, ursolic acid, juglangenin A, and teuviscin A	Anticancer activity	[38–41]
Valeriana officinalis L.	Caprifoliaceae	Isovaleric acid, gamma-aminobutyric acid, valerenic acid, and valerine	Relieves mild nervous tension and helps in sleep	[42–44]
Eucalyptus obliqua L'Hér.	Myrtaceae	1,8-cineole, catechins, isorhamnetin, luteolin, kaempferol, phloretin, and quercetin	Anticancer, antioxidant, antiseptic, stimulant, antimalarial, anthelmintic action, anti-inflammatory, and antihistaminic	[45–48]
Panax ginseng C. A.Mey.	Araliaceae	Ginsenosides	Improve phagocytosis, interferon production, and vasodilation, and affects the hypoglycemic activity	[49–51]
Stachytarpheta jamaicensis (L) Vahl	Verbenaceae	Gamma-aminobutyric acid and dopamine	Inhibition of the chicken pox virus	[15, 52]
Moringa oleifera Lam.	Moringaceae	Quercetin, kaempferol glycosides, myricetin, and epicatechin	Hypolipidemic, hypoglycemic, antioxidant, anti-inflammatory, and anticancer properties	[53–55]

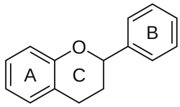

Fig. 1 Basic structure of flavonoids

antibacterial and antioxidant activities [64, 65]. Besides, it is protective against acute lung injuries, cardiovascular diseases, and breast cancer [66–68].

2.1.2 Flavanone

Flavanone is the direct precursor of most flavonoid synthesis. It has a saturated and oxidized C ring. For instance, naringenin and hesperetin are analogue compounds for flavanones and excipients richer in citrus, lemon, grapefruit, and fruit peels. Naringenin is potentially antiviral and antitumoral, preventing cardiovascular disease [69–71]. Hesperetin and its derivatives positively improve acute lung injury, diabetes, and Alzheimer's disease [72–75].

2.1.3 Flavone

Flavone is one of the largest subgroups of flavonoids. Compared to flavanones, besides having a keto group at position four on the C ring, there is also a double bond between the C-2 and C-3 of the C ring. Flavone is present in practically all plant tissue. It has commercial and pharmaceutical value as neuroprotective [76, 77]. For example, apigenin protects neuronal cells from injury by inhibiting microglia cells [78]. In addition, some studies showed that apigenin is safe for humans, which makes it a suitable target for future drug development [79, 80].

2.1.4 Flavanol

Flavanol has a saturated and oxidized C ring and a hydroxyl group in C-3 or C-4 of the C ring. It is mainly found in cocoa, fruits, cereals, and vegetables [81]. Flavanols are important bioactive compounds in *Theobroma cacao*. Researchers have proven its efficacy in anti-inflammatory, neuroprotective, and cardiovascular diseases [82–85]. Recently, Hidalgo et al. [86] investigated the therapeutic activity of epicatechin and epigallocatechin-3-gallate (the main active compound in green tea) flavanols toward nonalcoholic fatty liver disease. Their findings reflected several beneficial properties besides its ability to prevent or treat nonalcoholic fatty liver disease, such as antihyperglycemic, antihypertensive, antithrombotic, anti-inflammatory, and antifibrotic effects. Moreover, following the US Food and Drug Administration classification, they reported its safety on humans as harmless.

2.1.5 Flavonol

Flavonol has a hydroxyl group in C-3 of the C ring, like flavanol. However, there is also a double bond between the second and third carbons in the C ring. Kaempferol and quercetin are representative compounds of flavonols. Both have anxiolytic, antiviral, and anti-inflammatory effects [62, 87]. Tian et al. [88] studied the antioxidant (through the activities of phagocytosis, DPPH, and ABTS radical scavenging)

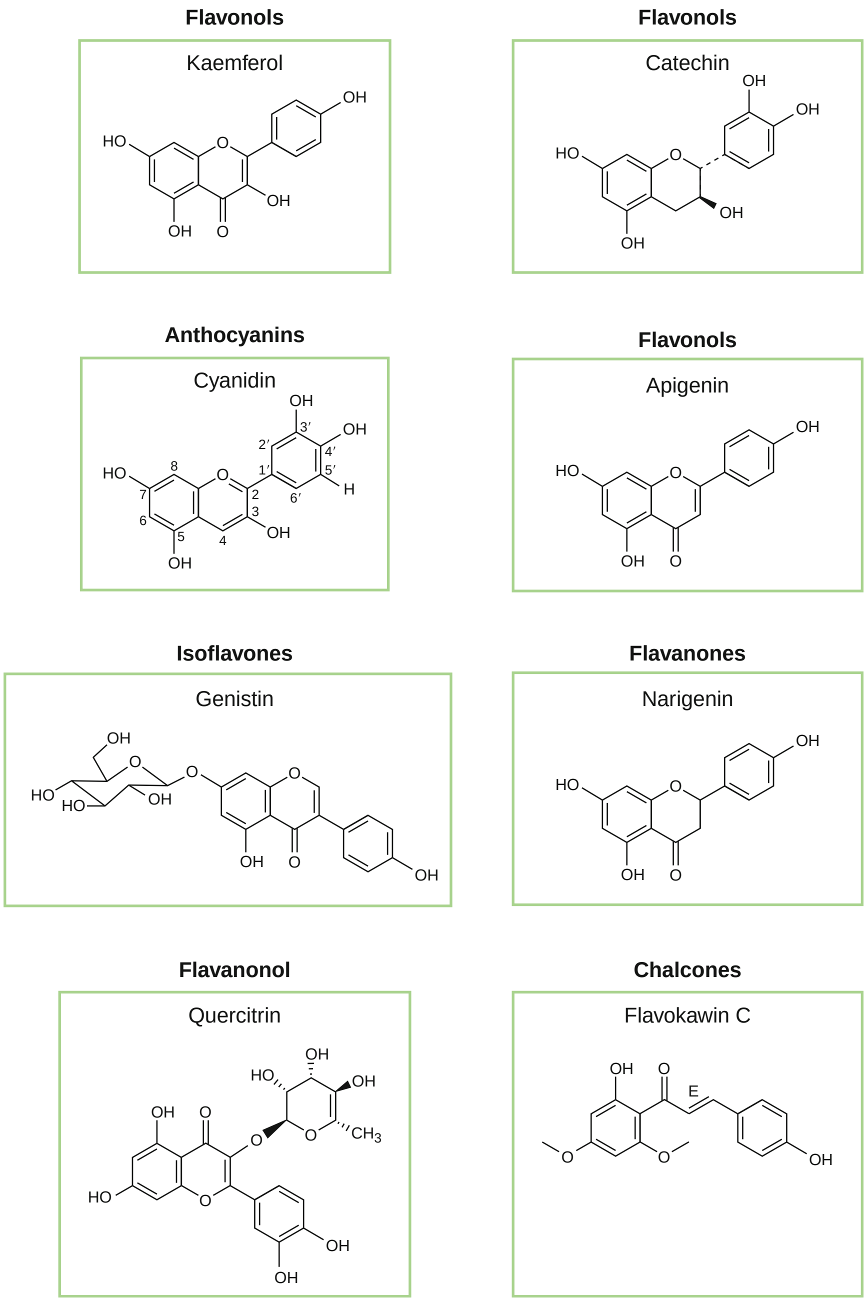

Fig. 2 Examples of different flavonoid categories. (Modified after Bešlo et al. [63])

and anti-inflammatory properties of some flavonols (kaempferol, luteolin, quercetin, and apigenin). The results showed that quercetin is a promising anti-inflammatory and antioxidant substance potentially as a therapeutic adjunct for inflammatory disorders and oxidative stress. Furthermore, preliminary findings from this study indicated that antioxidant activity is directly correlated with the number of phenolic hydroxyl groups. A comparison of anti-inflammatory and antioxidant activities revealed that compounds with enol groups were better than those without.

2.1.6 Flavanonol

Flavanonol has a hydroxyl group at position C-3 and a keto group at C-4. Its compounds can exist in free or combined form and are mainly abundant in citrus. Additionally, flavanonols are found in various medicinal herbs families, like Rutaceae, Leguminosae, and Rosaceae [89]. Flavanonol has significant medical value in vascular protection; it has been found that taxifolin has some therapeutic properties, including preventing the damage of vascular structure in diabetic patients, improving capillary microcirculation, and improving blood flow in the retina [90].

2.1.7 Anthocyanidins

Anthocyanidins are water-soluble pigments widely distributed in flowers and can also be detected in leaves, roots, and fruits (strawberry, chokeberry, and elderberry) [91–95]. The soluble pigment helps plants show different colors (red, orange, blue, and green). Consequently, approximately all angiosperm species contain anthocyanins [96, 97]. The structure is characterized by the absence of ketone in the C-4 position of the central heterocyclic ring and the positive charge of the first oxygen atom in the C ring. In flora, anthocyanins are the most prevalent anthocyanidins (containing glycosylated flavylium ion). Up to 300 anthocyanidins have been identified [98], whereas there are approximately 8,000 possible anthocyanins, such as the various anthocyanidin subtypes and the glycosylated [99].

Polyphenolics, especially anthocyanins, have recently become more relevant in treating chronic diseases like cardiovascular diseases [100]. Pergola et al. [101] investigated that the blackberry extract (about 88% of the cyanidin-3-glucoside out of the total anthocyanin content) inhibited the deleterious cardiovascular activity of nitric acid. Moreover, Graf et al. [102] studied the antiatherogenic activity of anthocyanins in the grape-bilberry extract. The results demonstrated that a dose of 1.55 mg/L decreased the total content of cholesterol and triglyceride levels in treated models. Additionally, anthocyanins reflected a physiological disruption of many groups of fatty acids, including a reduction in saturated fatty acids and an elevation in the long-chain fatty acids in plasma. Consequently, these findings showed the antiatherosclerosis activity of anthocyanins-rich grape-bilberry juice.

2.1.8 Chalcones

Chalcones are open-chain flavonoids (alpha, beta-unsaturated ketones) lacking the structural formula's complete C ring. The basic structure of chalcones includes two conformations: cis and trans isomers [103]. It is widely distributed in medicinal herbs and can be modified into diversified forms (prenylated chalcones (3, 4, 7), licochalcones, and dihydrochalcones). Chalcones and derivatives have been reported for pharmacological activities in the aspect of antiviral, cardiovascular disease prevention, antimicrobial, antioxidant, analgesic, and antidiabetic functions [104–108]. Many researchers reported the pharmaceutical properties of chalcones. Tang et al. [109], Acharjee et al. [110], and Attarde et al. [111] showed the antidiabetic activity of chalcone, piperonal chalcones derivative, and 3-(4-hydroxyphenyl)-1-phenylprop-2-en-1-one (chemically synthesized chalcone) exhibited significant suppression of the activity of α-glucosidase and α-amylase.

2.2 Alkaloids

Alkaloids are a prominent structurally diverse family of heterocyclic substances containing nitrogen in the heterocyclic ring and obtained from amino acids [112]. They exhibit a variety of significant physiological impacts on humans and other mammals. Morphine, strychnine, quinine, ephedrine, and nicotine are prominent alkaloids. Alkaloids are mainly found in plants and are particularly prevalent in certain flowering plant families [113]. Around 20% of higher plant species are estimated to contain alkaloids, with several thousand distinct varieties, besides some other alkaloid-rich families, including Ranuculaceae, Amaryllidaceae, and Solanaceae [114]. They are primarily associated with plant defense against herbivores (feeding deterrence) and pathogens (antibacterial and antifungal activities). Traditional and recent applications of alkaloids range from 25–75% in pharmaceuticals, demonstrating their enormous medicinal potential [115, 116]. The fundamental quality of alkaloids is no longer the requirement for an alkaloid, and the chemical reactivity of nitrogen atoms permits at least four classes of nitrogenous substances.

Moreover, several synthesized substances with equivalent structures are also referred to as alkaloids [117]; however, others can produce salts with organic acids like oxalic and acetic acids. Certain botanical alkaloids, such as solanine in the Solanaceae family, exist in a glycosidic form. The biosynthetic pathway of the alkaloid is involved, especially in the decarboxylation of substances [118]. For example, aspirin is the most common antiplatelet (pain treatment) medicine, prepared mainly from salicin alkaloids originating from the willow plant (*Salix alba* L.) [119].

According to their biochemical precursor and heterocyclic ring arrangement, alkaloids have been categorized into several groups, including indole, piperidine, tropane, purine, pyrrolizidine, imidazole, quinolizidine, isoquinoline, and pyrrolidine [112, 120]. Fig. 3 shows the structural formula of some potent alkaloid substances.

Some pure isolated alkaloids and synthetic analogues (berberine, serotonin, dopamine, and gamma-aminobutyric acid) are employed as fundamental therapeutic agents globally due to their antispasmodic, antimalarial, antibacterial, and analgesic activities [121, 122]. Alkaloids can prevent the beginning of several degenerative disorders by scavenging free radicals or interacting with the oxidation reaction catalyst. Numerous studies have evaluated the vast spectrum of pharmacological properties of alkaloids

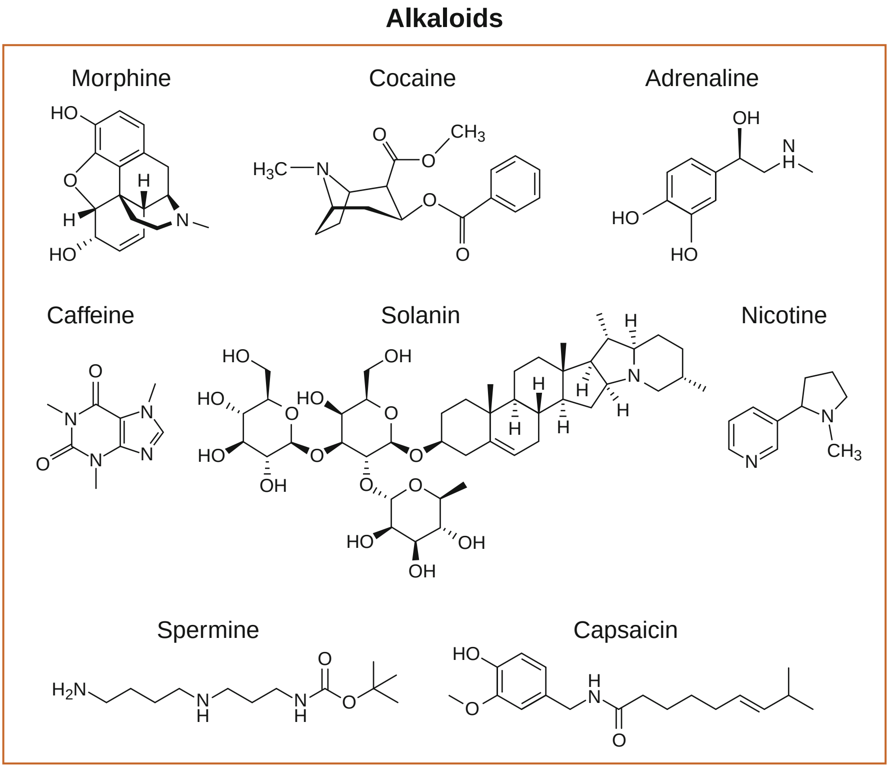

Fig. 3 Examples of some vital alkaloid compounds

from diverse plants [120]. For instance, the active ingredients of *Papaver somniferum* L., the opium poppy (morphine), and its methyl ether derivatives (codeine) are comparatively nonaddictive analgesics [123]. Moreover, some alkaloids stimulate the cardiovascular or respiratory systems. Uzor [124] reported that quinine, chloroquine, amodiaquine, mefloquine, artemisinin, and artemether are the most vital antimalarial alkaloidal drugs. In addition, Kouam et al. [125] isolated three novel antimalarial indolosesquiterpene alkaloids from the bark extract of *Polyalthia oliveri*. Several studies [112, 126–131] investigated the activity of some active alkaloid constituents, such as atropine (from *Atropa belladonna*) acts as an antidote; ephedrine (from *Ephedra sinica*) can be used as antiasthmatics; and emetine (from *Carapichea ipecacuanha*) as antiprotozoal. Furthermore, noscapine (from *Papaver somniferum*) is used as an antitussive and used as a product in the following names Bequitusin, Degoran, and Tussisedal. In addition to pharmaceutical drugs, some alkaloids have been used as antiplatelet substances. Rutaecarpine, an alkaloid derived from *Evodia rutaecarpa*, was demonstrated as an antiplatelet, and its derivatives (3-methylenedioxyrutaecarpine, 3-chlororutaecarpine, and 3-hydroxyrutaecarpine) reflecting a significant enhancement of its role by interacting with several mediators of coagulation factors [132, 133].

2.3 Terpenoids

Terpenoids are the largest class of phytochemicals (plant-specialized metabolites) with several significant pharmacological effects [134]. They are isoprene-based (5-carbon) metabolites commonly known as isoprenoids. Terpenes can be divided into six categories based on the number of isoprene units in their chemical structure: monoterpene, sesquiterpene, diterpenes, triterpenes, tetraterpenes, and polyterpenoids (Fig. 4) [135]. Terpenoids exist mainly in flowering plants and are responsible for the distinct aroma, flavors, scents, and colors of many species, such as eucalyptus, cinnamon, tomatoes, sunflower, ginger, and clove [136].

Hundreds of terpenoid compounds possess pharmaceutical characteristics; for example, most terpenes in *cannabis* sp. (tetrahydrocannabinol) have diverse pharmacologic effects, including anti-inflammatory, sedative, immunomodulatory, and neuromodulatory properties [137].

2.3.1 Monoterpenoids

The chemical structure of monoterpenes and their derivatives contains two isoprene units. They incorporate three subclasses, acyclic monoterpenes, monocyclic monoterpenes, and bicyclic monoterpenes. For example, the *Cymbopogon citratus*

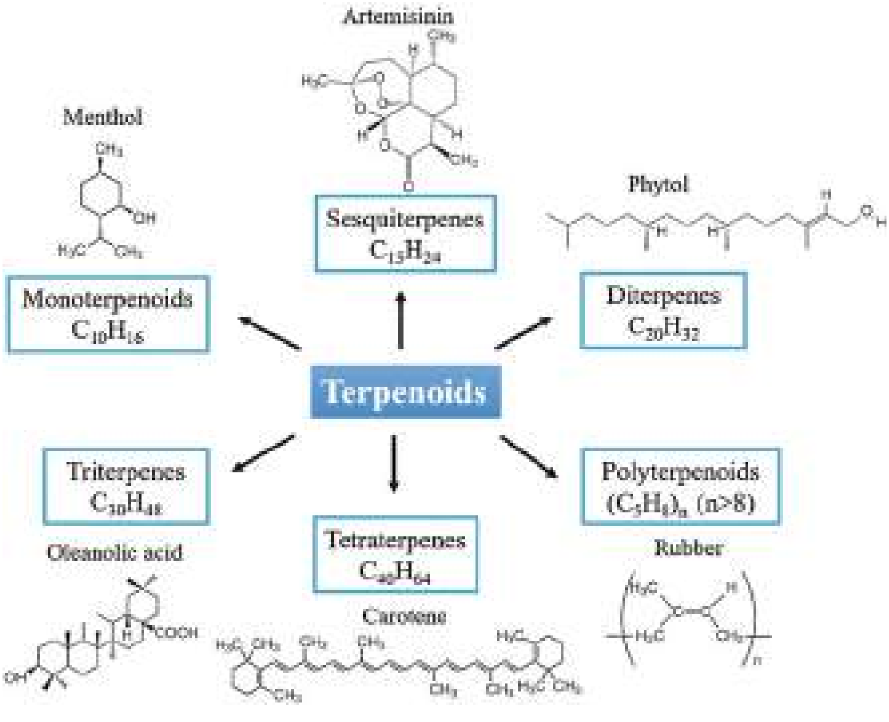

Fig. 4 Chemical structure of some representative terpenoid substances

(lemongrass) produces a large quantity of citronellol (acyclic monoterpene). Santos et al. [138] investigated that citronellol significantly affects bacterial, fungal, allergic, spastic, and diabetic resistance. More acyclic monoterpenes showed antibacterial, anti-inflammatory, and antianxiety properties, such as linalool and its derivatives [139, 140]. In addition, menthol is a monocyclic monoterpene with a prevalent analgesic activity in pain control [141]. α-and β-pinene are representative bicyclic monoterpenoid substances; however, they share the same molecular formula of C10H16, their chemical structures are distinct, and both exhibit anticancer and antimicrobial bioactivity [142–144].

2.3.2 Sesquiterpenes

Sesquiterpene compounds are the most common kind of terpene with three isoprene units. It is subdivided into straight sesquiterpenes (e.g., farnesol and nerolidol) and annular sesquiterpenes based on the stability of the carbon rings (e.g., artemisinin and guaiol). Almost 50% of sesquiterpene compounds contain lactones [145]. It has significant biological and physiological functions. Recent research demonstrated that sesquiterpene lactones could contribute to inflammation and cancer therapies [146, 147].

2.3.3 Diterpenes

Diterpene compounds comprise four isoprene units with one or more carbon rings within their molecular structure. Saha et al. [148] reported that diterpenes had a broad spectrum of microbial inhibition, including bacteria, viruses, and fungi. In addition, several studies reflected that it possesses anticancer, antidiabetic, and antitumor properties [149–153]. Diterpene compounds can not only inhibit the growth and spread of cancer cells but also promote the apoptosis of these cells. Thus, they are widely used to treat liver, lung, breast cancers, and other malignant tumors [151, 154, 155].

2.3.4 Triterpenes

Triterpene chemicals refer to six isoprene units–containing terpenes. The most common triterpene molecules are tetracyclic and pentacyclic, which have four- and five-carbon rings, respectively. Triterpenes showed potential medical activities; for example, oleanolic acid might combat diabetes by suppressing the function of α-glucosidase [156]. Moreover, Sohag et al. [157] revealed that lupeol (pentacyclic triterpene) safeguard against cardiovascular, renal, liver, and skin disorders. Sun et al. [158] summarized the effect of *Centella asiatica* triterpenes in treating common diseases and the underlying mechanisms, such as Alzheimer's disease, acne, chronic and recurrent liver injuries, pelvic inflammatory disease, and rheumatoid arthritis.

2.3.5 Tetraterpenes

Tetraterpenes are one of the isoprenoids containing eight isoprene units with molecular formula C40H64 – they involve many pigmentary substances (carotenoids) [159] and nonpigmentary compounds (poduran) [160]. Carotene is the first isolated tetraterpene discovered in carrots. Furthermore, beta-carotene has significant antioxidant effects that help in the treatment of many chronic diseases, such as optical diseases and particular cancers [161]. Zerres and stahl [162] reported that carotenoids are characterized by UV-absorbing properties and can be used as photoprotectants. They revealed that carotenoids provide comprehensive photoprotection after supplementation or consuming carotenoid-rich meals. Additionally, lycopene offers therapeutic potential to treat human malignancies [163].

2.3.6 Polyterpenoids

Polyterpenoid molecules have more than eight isoprene units and have a greater molecular weight than other terpenes. These can be extracted from some citrus oils or tree sap, and their yields fluctuate according to the growing seasons (e.g., rosin and its derivatives) [164]. Few investigations have been carried out on the pharmacological characteristics of polyterpenoids. Rubber is a natural polyterpenoid compound with between 1500 and 15000 isopentenyl units. de Barros et al. [165] and Mendonca et al. [166] showed that it influences wound healing and oxytocin-sustained release.

2.4 Phenolic Components

Phenolic acids are a large family of secondary aromatic metabolites. They are extensively distributed in their seeds, roots, stems, and leaves and are associated with xylans, pectin, and lignin. Similarly, to flavonoids, phenolic acids are essential members of the phenolic family. They comprise the most frequently distributed nonflavonoid phenolic molecules in plants and exist in various forms, like free, conjugated soluble, and insoluble bound. Phenolic compounds are the derivatives of benzoic and cinnamic acids [167]. The most common benzoic acid derivatives are p-hydroxybenzoic acid, salicylic acid, gallic acid, and ellagic acid, whereas the most prevalent derivatives of cinnamic acid are p-coumaric acid, caffeic acid, and ferulic acid [168]. Phenolic acids compounds can be classified into two fundamental subclasses hydroxybenzoic and hydroxycinnamic acids (Fig. 5).

In hydroxybenzoic acid, one of the hydrogens on the benzene ring is substituted by the carboxyl group (—COOH). The majority of hydroxybenzoic acid compounds exist as free acids, while a few occur as esters or glycosides. Hydroxycinnamic acids comprise a three-carbon chain connected to the benzene ring (C6H5CHCHCOOH) with at least one hydrogen atom that an OH group can replace [169]. In drug development technology, phenolic components have a significant interest worldwide due to their diverse chemical structures and biological activities. They play a crucial function in antihypertensive, antidiarrheal [170], neuroprotective, antidepressant, anti-inflammatory, anticancer, and antihyperglycemic drugs [171]. In addition, phenolic acids can suppress the activity of acetylcholinesterase and butyrylcholinesterase, which play a crucial role in treating Alzheimer's disease [172].

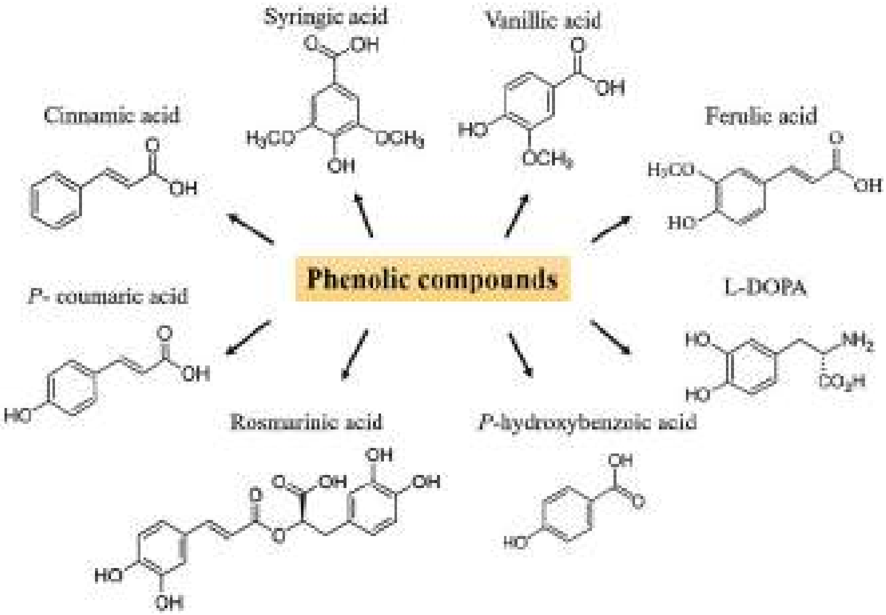

Fig. 5 Examples of some phenolic compounds

2.4.1 Hydroxybenzoic Acids

Hydroxybenzoic acid comprises a benzene ring, a carboxyl group, and additional hydroxyls, methyl (CHn), or methoxy (CHnO) groups attached to the benzene ring. The primary components of hydroxybenzoic acids include gallic, p-hydroxybenzoic, protocatechuic, and vanillic-hydroxybenzoic acid components produced as a resultant product of aromatic amino acids through the shikimic acid pathway [173]. Here, chloroformate intermediate is used to convert shikimic acid to L-phenylalanine. Consequently, L-phenylalanine is translated into p-hydroxybenzoic acid (a precursor to other phenolic acid metabolites) [174]. Moreover, the hydroxylation and methylation of its benzene ring produces other hydroxycinnamic acids (including ferulic and caffeic acids) or hydroxybenzoic acids (such as protocatechuic and p-hydroxybenzoic acids). It is hypothesized that hydroxybenzoic acid is synthesized by hydroxycinnamic acid with a similar structure via CoA-dependent (oxidative) or CoA-independent (nonoxidative) or a mixture of both mechanisms [169].

P-hydroxybenzoic acid, its derivatives, and vanillic acid are the major phenolic acids in many plant species, including cereals, flaxseeds, chia, and sunflower seeds [175–177]. Most of the hydroxycinnamic acid derivatives in chokeberry are chlorogenic and neochlorogenic acids. At the same time, strawberries and red raspberries involve predominant types of hydroxybenzoic acids, such as p-coumaric acid, p-hydroxybenzoic acid, and ellagic acid, respectively [168]. Hydroxybenzoic acid has contributed to significant medical research advances. Adefegha et al. [178] reported that some hydroxybenzoic acids have antidiabetic properties. For instance, gallic and protocatechuic acids inhibit the activity of type 2 diabetes–related enzymes (amylase and glucosidase). Furthermore, Yi et al. [179] investigated that the last mentioned acids (extracted from muscadine grapes) exhibited anticancer activities against cervical cancer.

2.4.2 Hydroxycinnamic Acids

From a structural perspective, hydroxycinnamic acids contain functional groups that can contribute to the coordination, like phenolic hydroxyl and carboxyl groups [180]. In addition, some compounds have phenolic hydroxyl groups and carboxyl groups of hydroxycinnamic acid and have one or two methoxy groups adjacent to phenolic hydroxyl groups on the benzene ring that have multiple coordination sites (which is crucial to the formation of complex and diverse compounds) [181]. Hydroxycinnamic acid is produced by lignin's metabolic pathway, which provides mechanical support for the plant cell wall [182]. It is catalyzed by phenylalanine ammonia-lyase, which deaminases L-phenylalanine to generate (E)-cinnamic acid. Then it undergoes further enzymatic transformations to create some related metabolites [183].

Recently, hydroxycinnamic acids' antioxidant, anti-inflammatory, and antibacterial properties have been investigated and employed in various pharmaceutical domains [184]. Many studies focused on vasodilation, antioxidant activity, and inflammation characteristics of hydroxycinnamic acid. Recent research showed that hydroxycinnamic acid compounds could reduce the severity of cardiovascular diseases [185, 186], hypertension [187, 188], depression [189], and diabetes [190]. Moreover, Tresserra-Rimbau et al. [179] and Adriouch et al. [180] studied that the high-intake percentages of hydroxycinnamic acids in daily meals significantly reduced the risks of cardiovascular disease in two countries (Spain and France).

2.5 Phytosterols

Phytosterols are cholesterol-like molecules found in various plants, with high concentrations occurring in the cell membranes of vegetables, fruits, and other plants. Phytosterol is a 3-hydroxy compound of cyclopentaphthene. The structure of phytosterols is similar to cholesterol; the main difference is that sterols are usually connected with a methyl or ethyl group at C-24, and common sterols have unsaturated double bonds between C-22 and C-23. Their structure comprises a steroid skeleton characterized by the saturated bond between C-5 and C-6 of sterol moiety [191]. Their aliphatic side chains are connected to C-17, while the hydroxyl groups are attached to the C-3 atom. They can be divided into sterols and stanols, representing unsaturated and saturated molecules. Phytosterols exist in four forms in plants, in the form of fatty acid esters, free alcohols, sterol glycosides, and acylated sterol glycosides [192]. They mainly exist in free and esterified forms (in edible oils), are found in plants, and cannot be synthesized in the human body. People mostly get phytosterols by ingesting dietary fiber, such as vegetable oil, beans, nuts, vegetables, and fruits [193]. Phytosterols show the characteristics of directly inhibiting tumor growth, including reducing cell cycle progression, inhibiting tumor metastasis, and inducing apoptosis, such as reducing the risk of oesophagal and ovarian cancers [194]. Campesterol, β-sitosterol, ergosterol, and stigmasterol are four representative compounds widely studied in treating diseases (Fig. 6).

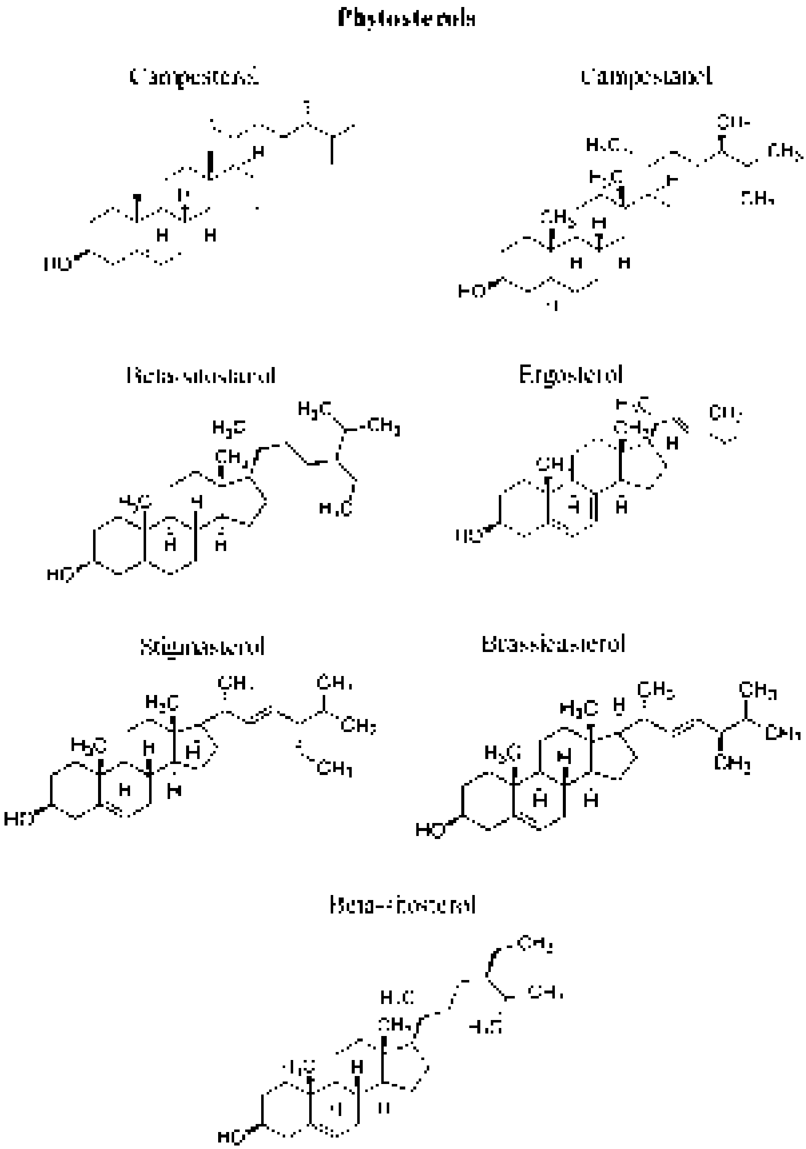

Fig. 6 Examples of some phytosterol compounds

Campesterol is abundant in canola and corn oils [195]. Campesterol has played an important role in inhibiting the proliferation of ovarian cancer cells and has the potential as a new antiovarian cancer drug. It was isolated from *Strychnos innocua* (Delile) and has been found to potentially affect antibacterial activity [196].

β-sitosterol has an unsaturated double bond on C5-C6, easily oxidized by active oxygen. Because of this structural characteristic, oxyphytosterols are one of the most common phytosterols in plants. Oxyphytosterols can play an important role as anti-inflammatory and antivirus agents. β-sitosterol can interfere with various cell signaling pathways, including cell cycle, proliferation, anti-inflammatory, hepatoprotective, and antioxidation [197]. Moreover, von Holtez et al. [198] discovered that low concentrations of β-sitosterol in cancer treatment dimensioned the development of cancer cells and even caused cancer cell death.

Ergosterol is the major steroidal component of the cell membrane of filamentous fungi and is not present or a minor component in most higher plants. It also exists in yeast cell walls and the mitochondrial membrane [193]. Its content has been widely used as an estimate of fungal biomass in soil and the aquatic environment because it was found that there was a strong correlation between ergosterol content and dry fungal biomass [194].

Stigmasterol is mainly found in soybeans. In addition to reducing cholesterol activity, stigmasterol has anti-inflammatory effects. Gabay et al. [199] showed that stigmasterol extracted from the bark of *Butea monosperma* (Lam.) Taub. has hypoglycemic, antiperoxidative, and thyroid-inhibiting effects.

3 Role of Secondary Metabolites in Diseases Treatment

Phytochemicals have been increasingly studied in disease treatment globally. In this section, the role of some phytochemicals in treating some disorders, including hepatic, renal, and cardiovascular disorders, cancer treatment, antimicrobial, anti-inflammatory activities, and neurological disorders, are discussed.

3.1 Hepatic Disorders

Nowadays, alternative therapy methods for several ailments are being embraced that use phytochemicals derived from natural resources. Despite significant developments in contemporary medicine, a persistent issue has been the lack of suitable and effective hepatoprotective medication [200]. Recent research has focused mostly on phytochemical screening to identify distinct types of biological activity. Recent years have seen a tremendous increase in interest in phytotherapy research as researchers look for new pharmacological cures. Numerous phytochemical substances, especially from medicinal herbs, are incorporated into the treatment of liver problems, including *Hedyotis corymbos*, *Rosa damascene*, *Casuarina equisetifolia*, *Cajanus cajan*, *Trichosanthes dioica*, *Glycosmis pentaphylla*, *Justicia gendarussa*, *Tinospora crispa*, *Bixa orellana*, *Moringa oleifera*, *Premna esculenta*,

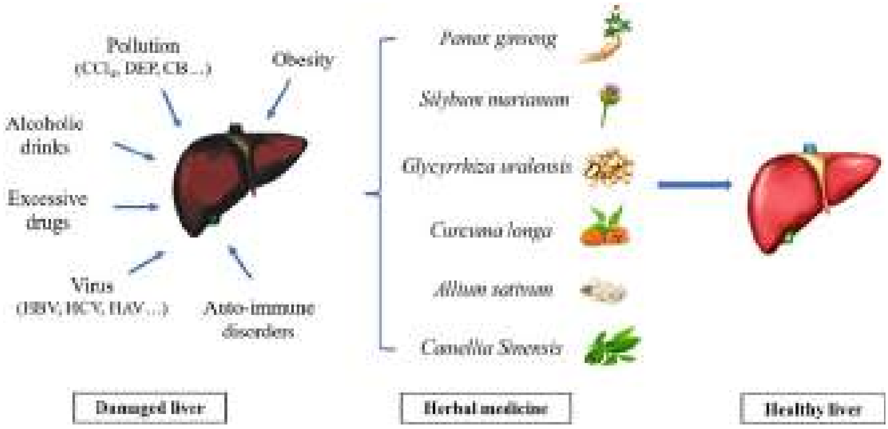

Fig. 7 Some vital phytochemicals support the hepatic disorders treatment. (modified after Das et al. [202])

Dendrophthoe pentandra, *Argemone mexicana*, *Leea macrophylla*, *Physalis minima*, *Synedrella nodiflora*, *Hylocereus polyrhizus*, *Caesalpinia bonduc*, *Piper chaba*, and *Bombax ceiba* (Fig. 7) [201].

Aguirre et al. [203] investigated some polyphenol components, like resveratrol (trans-3,4′,5-trihydroxystilbene) and stilbenoid involved in the enhancement of glycemic control and glucose tolerance, decrease in lipid levels, as well as anti-lipogenic, anti-inflammatory, and antioxidant properties. In addition, thymohydroquinone exhibited hepatoprotective characteristics toward drug-induced hepatotoxicity [204].

3.2 Renal Disorders

Renal damage and chronic kidney disorders are severe medical cases globally; the average number of patients increased by 8–16%. Besides Chinese herbal medicine metabolites, bioflavonoids, resveratrol, quercetin, and curcumin were demonstrated to be potential in chronic kidney disorders [205]. Green tea contains various polyphenolic substances, among them is epigallocatechin-3-gallate. Many reports showed the reactivity of epigallocatechin-3-gallate in renal damage treatment by delaying lupus nephritis via boosting the antioxidant Nrf2 pathway and diminishing the NLRP3 inflammasome activation. Additionally, ursolic acid (pentacyclic triterpenoid) is frequently found in fruit peels, herbs, and spices. Kunkel et al. [206] investigated that ursolic acid has a protective activity against chronic kidney disorders by suppressing the activity of STAT3 and the NF-B mechanism, hence decreasing the inflammatory activity. Moreover, allicin (organosulfur compound) enhances renal function by modifying the AT1, Nrf2/Keap1, and eNOS pathways and lowering CKD-mediated systemic hypertension [207].

3.3 Cardiac Disorders

According to current epidemiological forecasts, the globe is on course to experience a vascular typhoon of cardiovascular disease burden. In emerging nations, coronary heart disease raised by 120% in women and 137% in men in 2020 [208]. Therefore, researchers searched for natural plant-derived cardiovascular medicines. Soya bean isoflavones reported a powerful ability to manage the risk factors for cardiovascular disorders. Key isoflavones found in soya beans are present as glycosides (e.g., genistein, daidzein, and glycitin) and support cardiac function through various methods [209]. Many epidemiological, clinical, and experimental investigations revealed a positive correlation between green tea consumption and cardiovascular health, as green tea contains a high yield of catechins [210]. In addition, an epidemiological study suggests dietary carotenoids may lower the incidence of ischemic stroke, myocardial infarction, and coronary heart disease. Several phytochemical components, such as glucoraphanin, cucurbitacins, diosgenin, sulforaphane, and tocopherols, provide cardiovascular protection, reduce oxidative stress, enhance lipid profiles, and lower the blood pressure [211, 212].

3.4 Cancer Treatment

The number of cancer patients is still rising yearly, despite research into many ways to prevent and treat the disease. Reregulating cellular processes has been the focus of cancer treatment. Many clinical trials have examined cancer treatments using radiation, chemotherapy, antibody therapy, and immunotherapy. Because they cause deleterious effects on healthy cells, radiation and chemotherapy have serious adverse effects. Immunotherapy and antibody therapy exhibit exact cancer-targeting abilities, but they have a small therapeutic window and are sometimes expensive [213]. About 25% of medications utilized in cancer therapeutic settings come from plants (anticancer activity). For example, Lestari et al. [214] reported the anticancer activity of curcumin (1,7-bis(4-hydroxy-3-methoxyphenyl)-1,6-heptadiene-3,5-dione) (isolated from *Curcuma longa*) in colorectal cancer treatment.

Additionally, curcumin can be investigated as an antiangiogenic, anti-inflammatory, and antioxidant drug. Polyphenol flavonoid resveratrol (3,4,50-hydroxystilbene) can stop the growth of *H. pylori* and the division of gastric NSCLC cells preventing/treating gastric cancer [215]. Recent research revealed that the secondary metabolite hypericin from the plant *Hypericum* L. inhibited the overexpression of the ABC transporter in the HL-60 subclone leukemia cells via accelerating mitoxantrone-induced cell death [216]. Furthermore, β-carotene has been demonstrated to enhance the suppression activity of the anticancer drug (5-FU) on the development of tumors by oesophagal carcinoma (Eca109) [217].

3.5 Antimicrobial Activity

In the past 50 years, the development of vaccines and antibiotics has successfully eliminated infectious diseases such as *Mycobacterium tuberculosis* and smallpox, saving many lives. Plant secondary metabolites, such as flavonoids, phenolic, alkaloids, organic acids, and essential oils, have a significant role in antimicrobial properties. *Saussurea gossypiphora* contains multiple secondary metabolites, including apigenin and luteolin, which have antimicrobial activity against *Escherichia coli* and *Staphylococcus aureus* [218]. Other examples of heterologous expression of phytochemical pathways have shown it is possible to develop plants into pharmaceutical production platforms. *Crocosmia* spp. is an ornamental plant found to produce montbretin A, a potent inhibitor of human pancreatic amylase, which is a promising treatment for type II diabetes pending clinical validation.

Moreover, rosmarinic acid extracted from *Origanum vulgare* L. has significant antibacterial activity against *Helicobacter pylori* associated with an ulcer [219]. Flavonoids have multitarget characteristics, which can target bacterial plasma membranes to inhibit drug-resistant bacteria through different sterilization mechanisms. Isoprenylation of flavonoids plays a crucial role in antibacterial activity. Both α-mangostin and isobavachalcone target phospholipids, which destroy the membrane homeostasis and combine with the outer membrane permeabilizer against gram-positive bacteria. In addition, the antibacterial activity of phenolic secondary metabolites is attributed to the acidic characteristics of hydroxyl groups. The compounds change the permeability of cells, interfere with the enzymes involved in productivity, interrupt protein synthesis, and eventually lead to cell death [220]. Alkaloids affect the integrity of the cell wall of *Candida albicans*, leading to mitochondrial dysfunction, which in turn leads to the upregulation of oxidative stress. Similarly, essential oils have antimicrobial mechanisms that affect the ATP concentration and peptidoglycan of *Escherichia coli* and *Staphylococcus aureus*, resulting in cell wall damage [221].

3.6 Anti-Inflammatory Activity

Inflammation is the common process in the body's defensive response to hazardous stimuli, such as biological factors (bacteria, fungi, parasites, and viruses), physical factors (ultraviolet rays, extreme temperature, radioactive substances, and mechanical damage), chemical elements (a poisonous gas), and others. The uncontrolled inflammatory reaction is one of the main causes of allergies, cardiovascular diseases, and autoimmune diseases. Inflammation can cause various conditions, such as asthma, arteriosclerosis, and arthritis, which greatly threaten health [222]. Treating some inflammation-related diseases depends on steroidal and nonsteroidal anti-inflammatory drugs but treating such drugs will have several side effects. Therefore, using natural herbal medicines in treatment is particularly important. How to develop drugs with anti-inflammatory activity by using natural herbal medicine has become the hotspot of research. Natural herbal medicines can synthesize various anti-inflammatory compounds, including flavonoids, terpenoids, alkaloids, and essential oils.

Turmeric has anti-inflammatory and anti-arteriosclerosis effects. In India, turmeric is a traditional medicine used to treat rheumatic diseases [223]. It is reported that the genus *Ipomoea* and *Alstonia* species in Egypt have anti-inflammatory activity with little side effects. Furthermore, *Ipomoea pescaprae* extract has a therapeutic impact on dermatitis caused by jellyfish sting and oedema caused by ethyl phenylpropionate in experimental animals [224]. Studies illustrated this activity is due to the separation of some lipid and phenolic compounds.

In addition, licorice is the most frequently used traditional Chinese medicine; it can produce a variety of bioactive secondary metabolites, such as flavonoids, polysaccharides, and triterpenes. They have anti-inflammatory activity and are important as antibacterial, antiviral, and hepatoprotective substances [225]. Stilbenoids are found in tea, grapes, nuts, and berries. Resveratrol, pterostilbene, and piceatannol are well-known stilbenoids with indisputable anti-inflammatory activity in vitro and in vivo. Stilbene compounds are a group of plant phytoalexin polyphenols that can protect plants against pathogenic bacteria [226]. In folk medicine, these compounds are extensively used to treat skin inflammation, hepatitis, and stomachache. At the same time, they also have anticancer, neuroprotective, and antiviral properties. Recent studies reported that phenylpropanoids in essential oils have anti-inflammatory activities. Phenylpropionic acids are organic substances produced by plants that play an important role in preventing and treating trauma and infection. They are widely used in the medical field due to their corresponding pharmacological characteristics [227]. For instance, *Cinnamomum cassia* is commonly used to treat gastritis, anti-inflammation, and dyspepsia [228].

Moreover, alkaloids are widely distributed in *Menispermum dauricum* DC., *Tripterygium wilfordii*, and *Begonia kunmingshanensis* [229]. Wei et al. [230] stated that alkaloids have strong anti-inflammatory activity and are commonly used in treating ankylosing spondylitis, systemic lupus erythematosus, and other diseases. Berberine, sinomenine, dauricine, tetrandrine, stephanine, and lycorine in isoquinoline alkaloids have good anti-inflammatory effects. Piperidine alkaloids have anti-inflammatory, anti-arrhythmia, and anticancer effects. In addition to anti-inflammation, terpenoid alkaloids have antipyretic, analgesic, and antihypertensive effects [231].

3.7 Neurological Disorders

Neurological disorders affect the central nervous system and its peripheral nerves. The symptoms of neurological disorders include headaches, memory loss, slowness of movement, speech disorders, limb weakness, or pain. The causes of the disease are complicated; some neurological diseases have obvious heritability. Furthermore, environmental factors and age also affect nervous system health. The active ingredients in plants are very important in preventing and treating neurological diseases. Herbal medicines can delay or reduce the symptoms of neurological disorders. For example, tea polyphenols are a well-known active ingredient in tea. It can inhibit acetylcholinesterase and butyrylcholinesterase in improving Alzheimer's disease. In addition, tea polyphenols can modulate and shape gut microbiota to boost immunity and enhance sleep quality by the gut-brain axis. Phenolic substances extracted from grapes have a good antioxidant effect, which can reduce the formation of free radicals and prevent damage to protective cells, helping to alleviate neurological disorders and brain aging. Moreover, numerous research reported that cannabinoids (isolated from *Cannabis Sativa*) have sedative, anti-inflammatory, and analgesic effects. Thus, it can potentially relieve various neurological diseases [232, 233].

4 Artificial Phytochemicals Production

Herbal medicines have been utilized since antiquity, and several therapeutic plant secondary metabolites are employed directly as medications and raw resources for semisynthetic alterations. Their structural diversity, which frequently limits the cost-effective chemical synthesis and relatively low extracted content of many plant species, mandates the field-cultivated materials. The novel biotechnological fabrication techniques of these chemicals offer a variety of benefits, including predictable, steady, and longtime sustainable production, adaptability, and more straightforward isolation and purification [234]. Many researchers use genetic engineering to manipulate plant metabolism to manufacture artificial phytochemicals. This entails the introduction of genes that encode enzymes involved in synthesizing specific bioactive components in plants. For instance, scientists have successfully modified plants to generate secondary Taxol® (paclitaxel) metabolite. It is an isoprenoid extracted mainly from *Taxus brevifolia* plant and widely used in cancer treatment [235–237]. Moreover, the artificial synthesis of phytochemicals involves using genetically engineered microbes or "cell factories" engineered to manufacture certain compounds, including carotenoids, flavonoids, and terpenoids. The extracted chemicals are subsequently utilized as dietary supplements or food additives to enhance their nutritional value.

Plant synthetic biology attempts to avoid several challenges by overexpressing bioactive chemicals for large-scale synthesis and purification. The complete characterization of the biosynthetic process for the target molecule is the critical step in synthetic biology. Recognizing the interactions between produced intermediates and identifying the necessary components of a biosynthetic route based on conventional classes of enzymes can assist in completing several fragmented molecular mechanisms [238]. Moreover, contemporary sequencing technology has progressed, so whole genome sequencing and phylogenetic analyses of nonmodel species are now feasible [239]. For example, Natt et al. [240] identified a biosynthetic mechanism for producing and extracting colchicine (alkaloid) from *Gloriosa superba*. The study was conducted through previously derived RNA sequencing data of many plant species following metagenomics to ascertain eight critical genes in the pathway and to reassemble a 16-gene scheme in *Nicotiana benthamiana* with overexpression to generate N-formyldemecolcine (the colchicine precursor).

5 Recent Advances in Herbal Medicine

To understand the most recent advances in herbal medicine achievements, in this part, groups of studies conducted on the potentiality of plant secondary metabolites activity in disorders treatment are discussed. Several natural products derived from Chinese herbal medicine display anticancer properties, such as antiproliferative, proapoptotic, antimetastatic, and antiangiogenic effects, as well as the ability to regulate autophagy, modify multidrug resistance, balance immunity, and augment chemotherapy in vitro and in vivo. For instance, the therapeutic activity of curcumin, epigallocatechin gallate, berberine, artemisinins, ginsenosides, ursolic acid, silibinin, emodin, triptolide, cucurbitacins, tanshinones, ordonin, shikonin, gambogic acid, artesunate, wogonin, β-elemene, and cepharanthine has been discussed in more than 100 published research articles [241]. Curcumin has been found to possess diverse pharmacological effects, such as anticancer, anti-inflammatory, and anti-xidative activities, as supported by clinical data and comprehensive research [242, 243].

Curcumin and its derivatives have demonstrated promising potential as therapeutic agents for various malignant conditions, including cancer. Several research studies have demonstrated that curcumin and its derivatives can impede the growth of tumors in different human body regions, such as the head, neck, skin, ovarian, and gastric cancers[244–246]. Liu et al. [243] reported that the natural polyphenol curcumin (extracted from turmeric rhizome) suppressed the Janus kinase/signal transducers and activators of the transcription (JAK/STAT) pathway in cultured oesophagal squamous cell carcinoma (ESCC) cells. The attachment of cytokines to receptors activates JAKs, which phosphorylates STATs. STATs are translocated into the nucleus after being dimerized and phosphorylated to regulate gene expression. These genes, including cyclins and antiapoptosis proteins, are crucial for cell proliferation and survival [242]. The results showed that curcumin inhibits JAK2 activation, downregulating STAT3 signaling, suppressing cell proliferation and colony formation, cell cycle arrest, and apoptosis. In addition, curcumin substantially reduced tumor growth in xenografts derived from ESCC patients. These findings indicated that curcumin is a powerful agent for preventing ESCCs harboring constitutively active STAT3 proteins. In addition, curcumin substantially reduced tumor growth in xenografts derived from ESCC patients. These findings indicated that curcumin is a powerful agent for preventing ESCCs harboring constitutively active STAT3 proteins. A study by Sivanantham et al. [247] reflected the anticancer activity of curcumin and its role in treating head and neck squamous cell carcinoma (HNSCC). They combined curcumin with three anticancer drugs, including docetaxel, doxorubicin, 5-fluorouracil, and diammine dichloroplatinum (II) (cisplatin), and evaluated their joint influence on the HNSCC cell line NT8e. The outcomes showed that the combined administration of 5- fluorouracil or doxorubicin with curcumin significantly inhibited NT8e cancer cell proliferation and enhanced apoptosis. NT8e cells treated with 5-fluorouracil or doxorubicin in combination with curcumin exhibited apoptosis via inhibition of Bcl-2 and elevation of Bax, caspase-3, and poly-ADP ribose polymerase. The researchers undergo some confirmation experiments to ensure the results are obtained through DAPI staining and decreased red/green fluorescence by JC-1 observations of apoptotic cell features, such as membrane blebbing, nuclear condensation, and cell contraction.

Some phenolic substances collaborate with nonsteroidal anti-inflammatory drugs to block pro-inflammatory mediators' functioning or gene expression, such as cyclooxygenase (COX). Diverse phenolic components can also act on transcription factors, like nuclear factor-B (NF-B) and nuclear factor-erythroid factor 2-related factor 2 (Nrf-2), to upregulate or downregulate antioxidant response pathway constituents. Moreover, they may suppress enzymes involved in developing human diseases and have been utilized for treating various common human disorders, such as hypertension, metabolic issues, incendiary infections, and neurological disorders [247]. Hypertension is a prevalent and frequently progressive condition associated with a high risk of heart failure and complications [248]. According to estimates, up to 25% of adults struggle with hypertension globally [249]. Hypertension is a serious and becoming more prevalent global health issue. Multiple investigations have demonstrated that polyphenol-rich foods effectively prevent and treat hypertension, particularly through angiotensin-converting enzyme (ACE) inhibition [250]. Patten et al. [235] recently discovered about 74 plant families with substantial ACE inhibitory activity. Similarly, Han et al. [251] proved that some cocoa polyphenols, including catechins, flavonol glycosides, anthocyanins, and procyanidins, are bioavailable substances with antihypertensive properties by inhibiting ACE [252].

In addition, an in vitro study carried out by Bhandari et al. [253] investigated the antidiabetic efficacy of two soluble active compounds(−)-3-O-galloylepicatechin and (−)-3-O-galloylcatechin found in the ethyl acetate Bergenia ciliate extract served as catalysts for the dose-dependent suppression of porcine pancreatic amylase and rat intestinal maltase activation. The half-maximal inhibitory concentration (IC_{50}) value is the compound concentration required for inhibiting enzyme activity by 50%. The in vivo and in vitro suppressive enzyme activity of these compounds against α-glucosidase and α-amylase indicate that they have outstanding prospects for development as a treatment for type 2 diabetes [254].

Aging can be described as an accumulation of multiple detrimental changes in cells and tissues, which increases the risk of disease and mortality with advancing age. The free radical and oxidative stress theory [255] represents one of the most commonly accepted hypotheses for the aging mechanism. Despite normal conditions, oxidative damage occurs; however, as antioxidative and restoration processes become less effective with age, the rate of oxidative destruction rises [256, 257]. Plasma antioxidant capacity is correlated with antioxidant dietary consumption; it has been observed that a diet rich in antioxidants can mitigate the negative effects of aging and behavior. Multiple investigations suggest that a combination of antioxidant/anti-inflammatory polyphenolic substances found in fruits and vegetables may be effective antiaging compounds [258]. Anthocyanins, a category of flavonoids, are exceptionally abundant in brightly colored fruits, like berries, Concord grapes, and grape seeds. Anthocyanins have potent anti-inflammatory and antioxidant effects and inhibit lipid peroxidation and COX-1 and -2, which are inflammatory mediators. The antioxidant activity of formulations of flavonoid-rich fruits and vegetables, including spinach, strawberries, and blueberries, is very high. According to the results of Shukitt-Hale et al. [259], supplemental nutrition with spinach, strawberry, or blueberry extracts in a control diet was similarly effective in restoring age-related deficits in the brain and behavioral function of geriatric rats. Moreover, tea catechins have potent antiaging characteristics, and drinking green tea abundant in these catechins could potentially delay the advent of aging [260].

6 Conclusion

Natural plant secondary metabolites (phytochemicals) have unique chemical structures with a wide range of diversity in medicinal and biological characteristics. They significantly treated some diseases and chronic disorders (cancers, cardiovascular, hyperglycemic, and type 2 diabetes). Moreover, they are involved in many pharmaceutical industries, like cosmetics and food supplements. The classification and the taxonomic position of each group and plant species are crucial in understanding each phytochemical's distinct function and characteristics (physical and chemical properties, synthesis pathways, and extraction methods). Furthermore, nature may have more based on the number of secondary metabolites identified and extracted. Considering the developments in synthesis technology as well as the invention of more advanced isolation and analysis approaches, it should be possible to identify a significant amount of these additional phytochemicals. Moreover, artificial phytochemical manufactoring also offers the potential to increase the effectiveness and safety of natural phytochemicals. Scientists can confirm the absence of impurities and pollutants by synthesizing molecules in a sterile atmosphere. In addition, they can alter the structure of a substance to increase its efficacy or decrease its toxicity. Recently, many researchers reflected on the potency of many isolated active metabolites in treating some vital disorders and may replace commercial and chemically synthesized drugs, especially those offered for tumor treatment.

Abstract

The tropical plant *Cola accuminata*, more often known as Cola nut, has a long history of traditional and ethno-medical applications. Our discussions have covered many topics related to *Cola accuminata*, such as its phytochemical components, nutritional qualities, scientifically proven pharmacological effects, ethnomedicinal usage, safety concerns, and commercial values. Caffeine, theobromine, tannins, flavonoids, and phenolic compounds are only some of the many phytochemicals found in *Cola accuminata*. Its antioxidant, anti-inflammatory, anti-microbial, anti-glucose, neuroprotective, and cancer-fighting activities can be attributed to these components. Scientific studies proving the plant's usefulness in a variety of in vitro and in vivo models give data supporting these pharmacological potentials. *Cola accuminata* has a wide variety of historical and contemporary applications in traditional and folk medicine. It has been used in traditional medicine for a variety of purposes, including as a stimulant, to improve memory and focus, as an aphrodisiac, to treat respiratory diseases, and to control gastrointestinal issues. In addition to its diuretic properties, *Cola accuminata* has been used in wound healing and ulcer care. Nevertheless, when working with *Cola accuminata*, it is essential to prioritize safety. *Cola accuminata* contains caffeine, which in large doses can cause jitteriness, anxiety, and a rapid heartbeat in those who consume it. Care should also be required during pregnancy, lactation, and with certain medical conditions to avoid adverse reactions, drug interactions, gastrointestinal distress, and other complications. In addition, *Cola accuminata* has marketable qualities. Beverages, flavours, and conventional herbal medicines all benefit from their use. Moreover, the pharmaceutical sector is also interested in its features for the creation of new medicines and therapeutic agents.

Keywords

Cola accuminata · Bioactive compounds · Therapeutic potentials · Ethnomedical utilizations · Safety respects · Medicinal plants · Herbal medicine

1 Introduction

The cola nut (*Cola accuminata*), which is the produce of the Cola tree, is considered to be a fruit of paramount significance in West Africa, where it is used for a variety of uses by numerous ethnic backgrounds [1–4]. The fruit tree is not just native to West Africa, where it is cultivated, but it also has its origins in Africa as a whole. According to Unya [5], cola nut (sometimes spelt as Kola nut) belongs to the plant family Sterculiaceae, which has approximately 125 species of trees native to the tropical rainforests of Africa. The most common species in Nigeria are *Cola nitida* and *Cola accuminata* and it takes up an uncommon position among West Africans where it is extensively eaten [5]. The nuts of *Cola nitida* can be identified with its two cotyledons, while *Cola accuminata* can be differentiated with its two to seven cotyledons [6]. Moreover, the colour of *Cola nitida* varies between pink, white, and red, whereas *Cola accuminata* has a colour variation of white and pink [6].

The tree holds special significance in the people's social lives as well as their religious practices throughout the tropical regions of West Africa. Cola nut is highly valued across the entirety of West Africa by people of all socioeconomic backgrounds and religious persuasions, including but not limited to Muslims, Christians, and animists [7]. It is usually offered as a revered sacrifice and as a sign of reverence for the recipient among major tribes in Nigeria. It is also an essential component of getting people together in the community, in addition to playing an important role in a wide variety of rituals of advancement and events, including those that serve to bind legal agreements and treaties [8].

In the report of Sprague and Adega [9, 10], who comment on the vitality and significance of cola nut among the West African people. Portuguese explorer who travelled to the region in the year 1587 reported that a great deal of the inhabitant of the area he came across in his expeditions chewed on the cola fruit to quench their thirst as well as enhance the culinary delights of water [9]. Similar medicinal properties of the cola fruits observed by the explorer were also noted in other publications written by voyageurs at the same time. Other publications have also captured African practices, such as the use of the nut to fortify the digestive tract as well as battle cirrhosis of the liver [11, 12].

In Nigeria, the nuts are not only cultivated in a significant amount, but they are also considered to be an agricultural product that is of fundamental value in the daily routine of those who reside there due to the numerous functions that they play. As a result, the country located in the West African region is the highest production of cola nuts. According to Danquash [13], a significant part of the cola nuts produced in Nigeria are eaten within the borders of the country, while the remaining 10% is shipped abroad. According to Asogwa et al. [14], there is a vast amount of soils with high, moderate, and minimal reproductive rates in Nigeria that have the potential to be capitalized on economically for the production of cola nuts as part of an efficient land use management policy. These kinds of fertile soils have long since been discovered across various regions of the country.

Generally plants have shown that it is a new candidate for the production of drugs. From time immemorial plants have been used to treat and manage disease conditions as well as the preservation [15] and control of insects [16–21]. Therefore this chapter focuses on phytochemical constituents, nutritional characteristics, scientific validated pharmacological properties, ethnomedicinal uses, safety considerations, and commercial values of *Cola accuminata.*

2 History and Cultural Significance of *Cola accuminata*

Various Nigerian ethnic groups, such as the Igbo, Hausa, and Yoruba ethnic groups, make extensive use of *Cola accuminata* in the practice of traditional medical treatments as well as in cultural customs [22]. The plant has been used for medicinal purposes for a very long time, and at one point in history, it had been employed as an instrument of currency. A number of research studies, such as one that was conducted by Odugbemi [23], have provided evidence that it has been utilized in traditional medicine to treat conditions such as headaches and migraines a high fever and gastrointestinal problems.

According to Kammamposal and Laar [24], in the Nigerian culture, cola nuts are frequently given as a token of reverence and openness to visitors, and they are also used within traditional celebrations such as marriage ceremonies and naming rituals throughout a variety of cultural backgrounds. Accordingly, Kanu [25] asserts that the kola nut ceremony is a crucial communal rite in Nigerian culture. The celebration entails those participating in the breaking of kola nuts to share them with one another. The ceremony frequently goes hand in hand with dancing, musical entertainment, and the telling of stories.

The utilization of *Cola accuminata* in Nigerian traditional beliefs is further evidence of the historical significance of this plant in Nigerian society. The nuts are frequently presented as sacrifices to the gods because it is widely held that they possess mystical and defensive qualities. They are additionally employed in clairvoyance celebrations, during which they are tossed onto a special enchantment surface in order to decipher correspondence from the celestial beings [24]. This practice dates back to ancient Africa.

In Igbo land, *Cola accuminata* plays a significant role in their cultural and religious festivities. Cola nuts are broken open and shared during a significant communal rite in Igbo culture known as the kola nut ceremony [26]. Songs, dancing, and oral narration are common parts of the event, which is valued for its ability to bring people together and promote an atmosphere of neighbourhood [27]. Nwankwo et al. [28] noted that the kola nut is also an embodiment of tranquillity and has been utilized to mediate conflicts among various social groups. The fruits are also reported to possess mystical and defensive attributes, and they are frequently employed to make a tribute to the deities in customary faith. Tossed onto a divinity podium, they are employed to decipher information from the celestial beings in religious rituals [27].

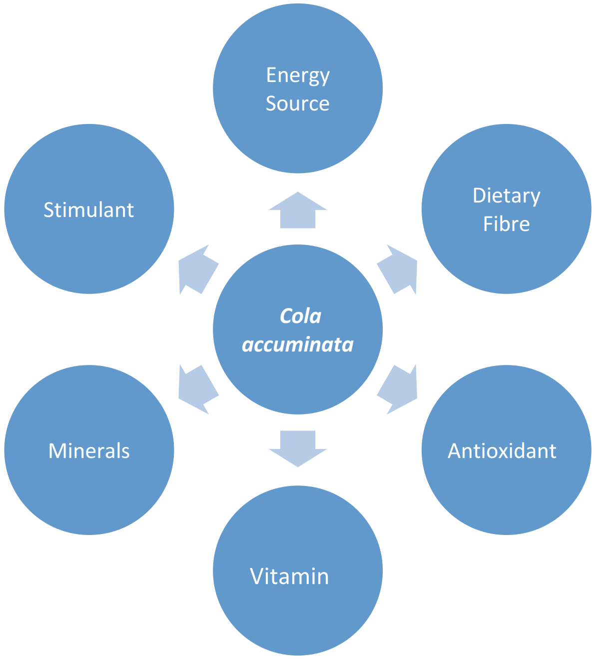
The Yoruba have traditionally associated *Cola accuminata* with warmth and close relationships. It is a common gesture of hospitality and reverence. The giving and receiving of Cola nuts are a vital component of social events and customary festivities [29]. The close connection between *Cola accuminata* and Yoruba religious and spiritual practices also demonstrates the plant's societal importance. During practices and rites led by traditional priests and priestesses, the nut is often used as an offering to the gods and ancestral deities. It is commonly used as a channel for interacting with the ethereal world due to its revered metaphysical status. In addition, the Cola nut is used extensively in their indigenous faith for divination purposes. Ifa divination, a multifaceted system that aids in decision-making, enlightenment, and reuniting with past generations and the divine, counts this as one of its key elements. Thus, the nuts are a symbol of the sanctity and significance of divination rituals [30].

Consequently, the historical and cultural significance of *Cola accuminata* is attested by the fact that it is still used and recognized in local communities today. The nut represents many different things, including national pride, friendliness, religious faith, and traditional medicine.

3 Nutritional Properties of *Cola accuminata*

Cola accuminata fruit, also referred to as cola nut, can be used in a number of different ways to improve one's diet because it contains a rich variety of vitamins and minerals. Approximately 2% of catechin, caffeine, theobromine, and kolatin can be found in the fruits [31]. The nuts can be baked, crushed, or gnawed at as well as be used as an additive to beverages like tea or dairy products, as well as breakfast cereal

Fig. 1 Nutritional properties of *Cola accuminata*



like porridge [32]. The flavour of the entire nuts is unpleasant whenever they are gnawed at whereas they leave an excellent aftertaste that brings out the flavours and deliciousness of additional food items in the dish [33]. Figure 1 shows a list of a few of the dietary uses of the *Cola accuminata* nuts.

3.1 Stimulant

Cola accuminata is famous for its stimulation qualities, which are mainly attributable to the existence of caffeine and theobromine in the nut. It is commonly eaten for the purpose of enhancing heightened awareness, bettering a person's energy demand, and fighting feelings of fatigue [34]. The caffeine content in *Cola accuminata* varies between 1% and 3%, dependent on the diversity and processing techniques deployed [35]. Theobromine is another stimulant compound that belongs to the xanthine family. It has a similar stimulatory effect as caffeine, but it is less potent. Theobromine levels in *Cola accuminata* varies between 0.5% and 1.5% [36].

3.2 Energy Source

Cola accuminata is an excellent source of carbohydrates, which can be utilized by the body to produce energy [37]. The carbohydrates found in *Cola accuminata* deliver a rapid boost to one's energy levels, which can be helpful during times of extended physical activity or instances of strenuous working out. According to Beck [38], the majority of the carbohydrates in *Cola accuminata* are found primarily in a range of sugars. These sugars include glucose, fructose, and sucrose. *Cola accuminata* also has fatty acids, which are an additional significant source of energy and are present in the plant [39]. In addition to being an excellent source of fatty acids, it is also necessary for the body to be able to absorb fat-soluble vitamins. A wide variety of essential amino acids, which are known as the fundamental constituents of proteins, are also found in *Cola accuminata.* When the body requires more energy, it is capable of converting amino acids into a usable form. According to Dah-Nouvlessounonh et al. [37], the high content of amino acids in *Cola accuminata* adds to the nutritional value of the plant when used as an important form of energy.

3.3 Dietary Fibre

The nut is an excellent source of dietary fibre, which is the portion of plant-based foods that cannot be digested. It is important for maintaining gastrointestinal tract functioning and is also an important factor in overall well-being. Consuming foods rich in dietary fibre can assist in the regulation of stool production, the avoidance of diarrhoea, and the promotion of a digestive system that is in good condition [40]. According to Okwu and Morah [41], it may also play a role in an impression of feeling satiated and contribute to staying on top of one's weight.

The nut has also been reported to contain soluble fibre, which is a type of fibre that disintegrates when immersed in water and produces a substance with the consistency of gel when it reaches the gastrointestinal tract [42]. According to Fernandez-Murga et al.'s [43] research, soluble fibre not only assists in controlling the amount of sugar in the blood but also minimizes blood cholesterol levels and fosters an optimal gut microbiome. Insoluble fibre is another fibre constituent in *Cola accuminata* which assists in adding mass to the diet and delays bloating by keeping bowel movements regular. It favours consistency and accounts for the general well-being of the gastrointestinal tract [43].

3.4 Minerals

The cola nut is an excellent source of a variety of minerals, including potassium, calcium, magnesium, and phosphorus, among others. Minerals such as these are required for the human body to carry out a wide variety of biological functions. Calcium in *Cola accuminata* is essential to keep healthy teeth and bones, as well as for adequate functioning of the muscles and nerves signalling [44]. The nuts of *Cola accuminata* are a good source of magnesium, which is a vital mineral that plays a role in countless biological processes in human beings, as well as the generation of vitality, the functioning of muscles, and ensuring the restoration of a healthy cardiovascular activity [45].

Cola accuminata is also an excellent source of the mineral potassium, which is essential to the regulation of fluid balance, the functioning of nerves, and the twitching of muscles [46]. Adequate potassium consumption has been linked with reduced blood pressure [45, 47]. According to Adeoye et al. [45], the mineral phosphorus can be found in *Cola accuminata*. This mineral plays an important role in maintaining healthy bones, creating energy, and synthesizing deoxyribonucleic acid (DNA). Zinc which is found in the nuts of *Cola accuminata* is very essential for the body's immune system functioning, the healing of wounds, and the production of DNA. According to Adeoye et al. [45], zinc is also important for preserving the health of the skin, hair, and nails. In addition, iron in the nuts is necessary for the production of red blood cells as well as the distribution of oxygen all over the body. Accordingly, Georgieff [48] affirmed that iron is essential for the generation of energy as well as for brain development.

3.5 Antioxidant

These substances are found in cola nuts, and these assist in protecting the body from the oxidative stress that is triggered by free radicals [49, 50]. Some examples of antioxidants found in *Cola accuminata* include phenolic chemical substances. Antioxidants have been linked to a decreased likelihood of developing long-term illnesses in addition to a general improvement in wellness and overall health [51, 52]. According to Adedapo et al. [53], the phenolic compounds found in *Cola accuminata*, which include flavonoids and tannins, are responsible for the plant's powerful antioxidant activity. The nuts of *Cola accuminata* is rich in catechins, which are a type of flavonoid that have powerful antioxidant properties. According to Adeyemi et al. [54], catechins have the ability to eliminate free radicals while safeguarding cells from damage caused by oxidative stress.

Cola accuminata is also an organic source of vitamin C, which is a potent antioxidant that assists in neutralizing free radicals as well as protecting the body cells from it [55]. It contains a sizeable amount of vitamin E, which is an antioxidant that is able to dissolve in fat. The substance helps in protecting the cell membranes of the body from damage caused by oxidative stress [56]. Moreover, *Cola accuminata* is loaded with proanthocyanidins, which are powerful antioxidants recognized to have a variety of medical advantages, such as acting as a shield for the cardiovascular system and soothing effects on inflammation [54].

3.6 Vitamins

These nutrients can be obtained naturally from the nuts. Thus, *Cola accuminata* is a natural source of vitamins, including vitamin C and a number of B vitamins. According to Adedapo et al. [53], *Cola accuminata* contains vitamin C, which is also referred to as ascorbic acid. Vitamin C works as an antioxidant and plays a role in the formation of collagen as well as the primary objective of the immune system and the uptake of iron. The nuts of *Cola accuminata* is also an organic source of B vitamins, including thiamine (B1), riboflavin (B2), niacin (B3), pantothenic acid (B5), pyridoxine (B6), and folate (B9). According to Oboh et al. [55] and Adedapo et al. [53], these vitamins are essential for the formation of red blood cells, the proper functioning of the body's nervous system, and the breakdown of calories. The nuts also contain Vitamin E which is a fat-soluble vitamin with antioxidant abilities that aid in safeguarding the cells against damage from oxidative stress [56]. According to Adaramogye et al. [56], *Cola accuminata* is a good source of vitamin K, which plays a role in the clotting of blood and maintaining bones in good condition. When included in a diet that is otherwise well-balanced, the vitamins that are found in *Cola accuminata* add to the total nutritional worth of the species and can give a variety of nutritional advantages to those who eat it. It is also essential to be aware that the number of vitamins of *Cola accuminata* may differ from one variety of the plant to another, due to its environmental factors as well as handling methods used.

4 Phytochemical Constituents of *Cola accuminata*

4.1 Proximate Composition of *Cola accuminata*

The proximate composition of *Cola accuminata* as reported by several authors varies in percentage composition among the constituent variables assessed as a result of its environmental factors and methods of samples processing. Table 1 gives a summary of the breakdown of the constituent elements as reported by some scholars.

4.1.1 Moisture Content

The moisture content of *Cola accuminata* is reported to vary between 5.80% and 54.40% of its dry matter content [–, 6, 35, 37, 39, 57, 58, 59]. This deviation of moisture content in the various investigations would definitely be associated with the duration the samples were dried before they were used for evaluation. This is in accordance with the report of a study conducted by Lowor et al. [60], who asserted in

Table 1 Proximate composition of *Cola accuminata*

Parameters	% Dry matter	References
Moisture content	3.39–54.4	[6, 35, 37, 39, 57, 58, 59]
Dry matter	45.6–96.62	[6, 35, 37, 39, 57, 58, 59]
Total ash	1.46–4.96	[6, 37, 39, 57]
Crude fat	1.20–15.72	[6, 37, 39, 57, 59]
Crude protein	8.80–11.95	[6, 37, 39, 57]
Total sugars	5.57–6.27	[37, 64]
Reducing sugars	15.22–71.16	[37, 64, 65]
Energy value (Kcal/g)	88.98–98.98	[37, 64]
Crude fibre	7.35–15.80	[6, 37, 39, 59]
Carbohydrate	33.84–67.22	[6, 37, 39, 59]

their report that the moisture content of a test sample varies according to their drying time. Thus, the relatively higher moisture content in *Cola accuminata* nuts in some samples would serve as an indicator that the product was going bad as any food sample that contains an excessive amount of moisture has the potential to support the growth of microbes. This is responsible for the vast majority of the biological, chemical, and physiological activities that take place in a plant [61]. Nevertheless, a low amount of moisture content in the nuts, will make it possible for them to be stored for an extended period of time without them becoming rancid.

4.1.2 Protein Content

Protein content in *Cola accuminata* ranges from 8.80% to 10.64% [6, 37, 39, 57]. The disparity between the protein content of *Cola accuminata* could be attributed to soil and environmental circumstances arising from the fact that the lack of water in the soil would contribute to inadequate amount of nitrogen availability in the plant's tissues [22]. In addition, physiological features of a plant can be innately affected by its genetic composition [62] as it imposes a higher degree of resistance to the nitrogen supply and water deficiency in a plant. Nevertheless, the relatively high protein content of *Cola accuminata* nuts could be used to supplement the amount of protein needed in the body for growth and development [63]. In addition, [6] opined that the nuts of *Cola accuminata* would serve as a suitable alternative for the production of curd or as an additive material to other vital minerals for the formation of a gel in food products especially protein gel which serves as a structural matrix for holding water, flavour, sugars, and food ingredients.

4.1.3 Fat Content

Cola accuminata has a crude fat content that is anywhere from 1.20% to 15.72%. This data indicates that the crude fat content of *Cola accuminata* is highly variable with different studies having reported widely varying amounts. According to Adeniyi et al. [39], analysis of the nutritional profile of *Cola accuminata*, the nut had a crude fat content of 2.87%. The fat content of *Cola accuminata* was calculated to be 1.20% by [57], while the fat content of *Cola accuminata* was reported to be higher at 10.55% by [6].

Similarly, a study by Dah-Nouvlessounon et al. [37] found that *Cola accuminata* has a crude fat content of 15.72% and *Cola accuminata*'s fat content was 5.33%, which was reported according to an analysis by Adeyeye and Ayejuyo [59]. These studies shed light on the fact that the crude fat content in *Cola accuminata* varies, depending on a number of variables such as the variety, the growing conditions, and the processing methods used. These numbers are averages, and there may be some variation in fat content between different samples.

4.1.4 Ash Content

Cola accuminata's total ash content can be anywhere from 1.46% to 4.96%. The presence of mineral components in *Cola accuminata* has been suggested by the fact that various studies have reported varying values for the plant's ash content. In their analysis of *Cola accuminata*'s nutritional profile, Adeniji et al. [39] found that the plant had a total ash content of 2.35%, while according to research by Mustapha [57], *Cola accuminata* has an ash content of 1.46%. Nevertheless, *Cola accuminata*'s total ash content was reported to be 4.96% in a study conducted by Dah-Nouvlessounon et al. [37]. Thus, the mineral composition of *Cola accuminata* has been elucidated by these studies. After plant matter has been completely burned, inorganic mineral residue is left, which is represented by the ash content. It is an indicator that *Cola accuminata* contains beneficial minerals like calcium, potassium, magnesium, and phosphorus and is, therefore, crucial to the body's normal functioning and preservation of health.

4.1.5 Total and Reducing Sugar Content

Both Kingsley et al. [64] and Dah-Nouvlessounon et al. [37] report that the total sugar content of *Cola accuminata* is relatively high compared to their nuts, ranging from 5.57% to 6.27%, while its reducing sugar content varies between 15.22% and 71.16% [37, 64, 65]. These variations in total and reducing sugar content of the nut is attributed to factors such as the cultivar, growing conditions, and maturity of the plant.

4.1.6 Carbohydrate and Energy Value

Carbohydrates, found in nuts like *Cola accuminata*, are an important macronutrient because they provide the body with energy. Carbohydrates, mainly in the forms of dietary fibre and sugars, are present in nuts of *Cola accuminata* in varying amounts of 33.84–67.22 as reported by the studies of Adeniji et al. [39], Mustapha [57], Abulude [6], and Adeyeye and Ayejuyo [59]. In addition, dietary fibre, a complex carbohydrate, is important for digestive function and bowel regularity. It helps with digestion and stool bulk, and it may be useful in warding off constipation. Sugars from carbohydrates are quickly absorbed by the body and used for fuel. They are quickly metabolized and absorbed, supplying energy for workouts and mental processes. Thus, *Cola accuminata* nuts may be a better choice for managing blood sugar levels than other snack options because they contain some natural sugars but are generally low in sugar compared to other snack options [66].

4.2 Antioxidants Properties

4.2.1 Free Radical Scavenging Activity

The high concentration of phenolic compounds and flavonoids in *Cola accuminata* is responsible for its potent free radical scavenging activity. These antioxidants eliminate dangerous free radicals, protecting cells and tissues from oxidative damage. Antioxidant phenolic chemicals present in *Cola accuminata* have been widely acknowledged for their value. Catechins, flavonols, and phenolic acids are just a few examples of these molecules that can boost the plant's antioxidant capacity. The antioxidant and anti-oxidative properties of phenolic compounds such as flavonoids have long been recognized. They are essential in lowering oxidative stress due to their powerful antioxidant capabilities. *Cola accuminata* has a high antioxidant capacity thanks to the presence of flavonoids, which help to scavenge free radicals and lessen oxidative damage. The antioxidant and free radical scavenging properties of tannins are well recognized, and *Cola accuminata* has a lot of them. It has been established that tannins have potent antioxidant properties, protecting cells from oxidative stress-induced damage. This capacity of *Cola* species extract to scavenge free radicals and protect against oxidative stress was reported in a study by Fabunmi and Arotupin [67].

4.2.2 Hydrogen Peroxide Scavenging

Hydrogen peroxide (H_2O_2) is a reactive oxygen species that can damage cells. The scavenging ability of *Cola accuminata* against hydrogen peroxide was reported by Adedapo et al. [53]. According to the results of the study, the oxidative damage caused by H_2O_2 can be reduced by using a methanol extract of *Cola accuminata*'s leaves and stems. The extremely reactive chemicals known as free radicals have been linked to oxidative damage in cells and the progression of illness. *Cola accuminata*'s ability to scavenge free radicals aids in the neutralization of these potentially damaging radicals and protects cells from oxidative stress [68].

4.2.3 Metal Chelating Capacity

Cola accuminata has been shown to have metal chelating capabilities, making it useful for reducing metal-induced oxidative stress. Iron and copper, for example, can be catalysts in reactions that generate free radicals. By binding and sequestering certain metals, *Cola accuminata*'s chelating activity reduces their involvement in oxidative processes. Adedapo et al. [53] found that a methanol extract of *Cola accuminata* leaves and stems had a high metal chelating ability.

4.2.4 Lipid Peroxidation Inhibition

Blocking the chain reaction of lipid peroxidation results in cellular damage when reactive oxygen species are present. The research by Adedapo et al. [53] shows that *Cola accuminata* has anti-oxidant properties that protect against lipid peroxidation. Strong reduction of lipid peroxidation was observed in the methanol extract of *Cola accuminata* leaves and stems, suggesting its potential in protecting cells and tissues from oxidative damage. To prevent cellular damage caused by lipid peroxidation, which takes place when free radicals oxidize lipids in cell membranes, antioxidants are used. Inhibition of lipid peroxidation by *Cola accuminata* protects cell membranes against oxidative stress, as reported by Oboh et al. [68].

4.2.5 DNA Protection

Genomic material is protected from oxidative damage thanks to the DNA-protective qualities included in *Cola accuminata*. The DNA-protective activities of the aqueous extract of *Cola accuminata* seeds against oxidative stress-induced damage were studied by Adeyemi et al. [54]. This outcome suggests that *Cola accuminata* had the potential to aid in DNA maintenance and protect the body against mutations caused by oxidative stress. Consequently, these results emphasize *Cola accuminata*'s anti-oxidant capability, which makes it a significant natural resource for warding off the health risks associated with oxidative stress. *Cola accuminata* is able to shield cells and tissues from oxidative damage because of the wide variety of antioxidant qualities it possesses.

5 Traditional and Ethno-Medicinal Uses of *Cola accuminata*

The following traditional and ethno-medicinal uses of *Cola accuminata* have been documented in various studies and supported in its historical and cultural significance. However, it is important to note that while these traditional uses provide valuable insights, further scientific research is necessary to validate the efficacy, safety, and appropriate dosage of *Cola accuminata* for each specific use. Some of the traditional and ethno-medicinal uses of *Cola accuminata* are indicated in Fig. 2.

5.1 Digestive Aid

Cola accuminata has traditionally been used as a digestive aid. It has been hypothesized that it stimulates digestion by increasing gastric motility and secretion of

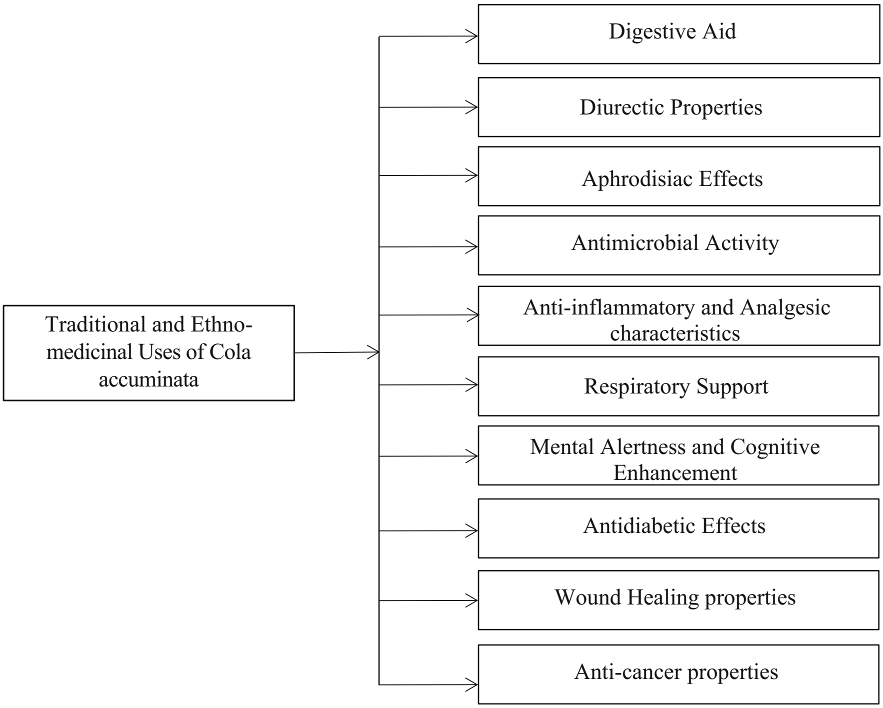


Fig. 2 Traditional and ethno-medicinal uses of *Cola accuminata*

digestive enzymes. Symptoms like bloating and flatulence can be reduced, and digestion can be enhanced [69–71]. *Cola accuminata* has been used traditionally for the treatment of gastric ulcers, and recent research suggests that this use may be justified because of the plant's anti-ulcer efficacy [72].

5.2 Diuretic Properties

Cola accuminata is commonly used as a diuretic because it stimulates the body to produce more pee. This can help the body get rid of accumulated fluids and waste products. *Cola accuminata* has long been used as a diuretic in the treatment of oedema and hypertension [73]. Udegbunam et al. [74] found that taking extracts from the plant *Cola accuminata* led to an increase in urine volume and an increase in the excretion of salt and potassium.

5.3 Aphrodisiac Effects

Cola accuminata has long been known for its aphrodisiacal properties. It may improve virility, libido, and performance in the bedroom. Traditional aphrodisiac use of *Cola accuminata* may be attributable to the plant's stimulating qualities, such as its caffeine content [75]. Nwonuma et al. [76] demonstrate that *Cola accuminata* may have pro-fertility benefits by increasing sperm count and motility.

5.4 Antimicrobial Activity

Significant antibacterial activity against a wide range of infections has been demonstrated by *Cola accuminata*. *Cola accuminata*'s antibacterial characteristics explain why it has been used historically to treat infections and wounds. Omwirhiren et al. [77], Wink [78], and Kamatenesi-Mugisha et al. [79] claim that it inhibits the growth of bacteria, fungi, and viruses, even certain strains that have developed resistance to antibiotics. Authors have variously reported that the bioactive substances such tannins, alkaloids, flavonoids, etc., are responsible for the antimicrobial activity of plants [80–101].

5.5 Anti-inflammatory and Analgesic Characteristics

Cola accuminata has traditionally been used for relief from pain and management of inflammatory diseases due to its anti-inflammatory and painkiller characteristics. Arthritis, rheumatism, and other inflammatory disorders may benefit from its anti-inflammatory and pain-relieving properties [56]. Flavonoids, phenols, and other bioactive chemicals are responsible for its anti-inflammatory and analgesic actions [68].

5.6 Respiratory Support

In the treatment of respiratory disorders like asthma, bronchitis, and cough, *Cola accuminata* has long been traditionally used to aid the body's natural defences. It is reported to have bronchodilatory and expectorant qualities that make it easier to breathe by breaking up mucus and opening airways [102]. *Cola accuminata* has shown promise as an anti-asthmatic agent, with preliminary research indicating it may relax bronchial smooth muscle and lessen inflammation [103].

5.7 Mental Alertness and Cognitive Enhancement

Cola accuminata is well-known for its stimulating features, such as its high caffeine level, which helps keep the mind alert and improves cognitive performance. It has a long history of use to boost memory, focus, and other mental abilities. Reduced weariness, increased alertness, and enhanced cognitive function have all been linked to the stimulating impacts of *Cola accuminata* on the central nervous system [104, 105]. Multiple studies have shown that *Cola accuminata* improves cognitive function, therefore it may be useful in treating dementia and Alzheimer's disease [106].

5.8 Antidiabetic Effects

Cola accuminata has shown remarkable antidiabetic capabilities, which brings us to our seventh point. Studies back up the folk applications of *Cola accuminata* for diabetic management. Blood glucose levels are lowered and glucose tolerance is enhanced, indicating hypoglycaemic activity [107, 108]. *Cola accuminata*'s anti-diabetic effects may be due to the presence of bioactive substances such alkaloids, flavonoids, and tannins [68].

5.9 Wound Healing Properties

Cola accuminata has long been used to aid in the recovery from wounds. It has been hypothesized to have tissue-regenerating and wound-protecting capabilities. Extracts of the plant *Cola accuminata* have been found to have healing and regenerative properties in studies [109]. Antimicrobial, anti-inflammatory, and antioxidant characteristics may account for its wound-healing actions [110].

5.10 Anti-cancer Properties

Cola accuminata has gained interest for its possible anti-cancer qualities. *Cola accuminata* extracts have shown anticancer efficacy in preliminary experiments against a number of cancer cell lines [106]. These cancers include breast, colon, prostate, and lung. *Cola accuminata* may have anti-cancer properties due to the presence of bioactive substances such as flavonoids and phenolic acids, which can suppress tumour growth and induce death [65].

6 Modern Scientific Research on Pharmacological Potentials of *Cola accuminata*

The pharmacological effects of *Cola accuminata*, often known as Cola nut, have been the focus of several recent scientific studies. These investigations have been conducted to determine whether or not *Cola accuminata* contains any bioactive chemicals for medicinal use. In Fig. 3, we highlight some of the most exciting recent developments in the study of *Cola accuminata*'s therapeutic potential.

6.1 Antimicrobial Activity

Adebayo et al. [111] tested *Cola accuminata* extracts for antibacterial activity against bacteria and fungus. The extracts inhibited drug-sensitive and drug-resistant

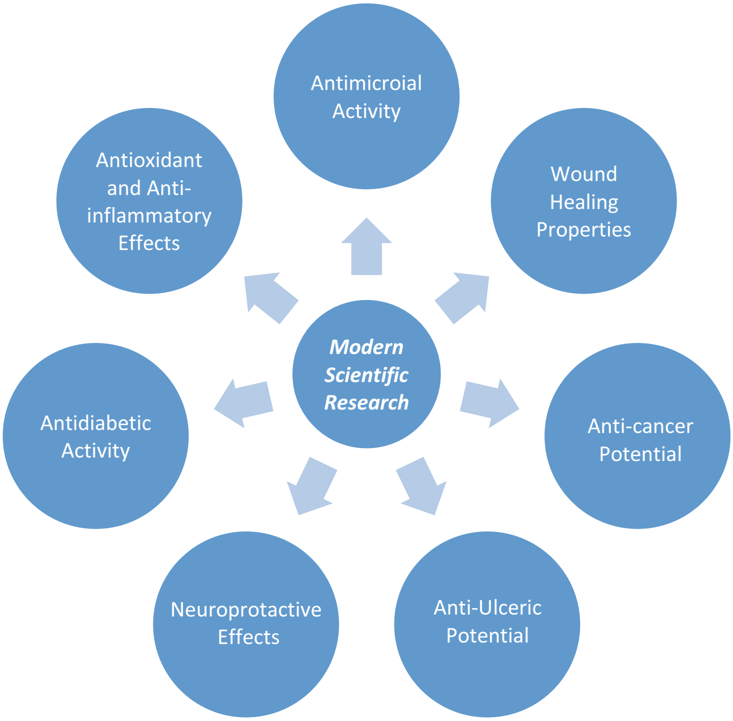

Fig. 3 Modern scientific research on pharmacological potentials of *Cola accuminata*

bacteria in the study. Bioactive substances such as tannins, alkaloids, and flavonoids had broad-spectrum antibacterial properties, according to the study. Also, in a study by Aiyegoro et al. [112], the authors tested *Cola accuminata*'s antibacterial efficacy against a variety of microorganisms. The extracts inhibited Gram-positive, Gram-negative, and drug-resistant microorganisms indicating that tannins, alkaloids, and flavonoids in the extracts had powerful antibacterial effects, according to the study. These studies therefore show that *Cola accuminata* possesses antibacterial capability. Tannins, alkaloids, and flavonoids in the plant provide broad-spectrum antibacterial activity. These chemicals inhibit drug-sensitive and drug-resistant bacteria and fungi, suggesting they could be used to generate new antimicrobials. These findings show promise, but more research is needed to identify and isolate *Cola accuminata*'s antibacterial bioactive components.

6.2 Antioxidant and Anti-inflammatory Effects

Amadi and Nwachukwu [113] and Akinmoladun et al. [114] examined *Cola accuminata* extract antioxidant properties. Phenolic chemicals and flavonoids in the extracts gave them antioxidant properties. These antioxidants neutralize free radicals, reduce oxidative stress, and protect cells from oxidative stress. These effects were linked to *Cola accuminata*'s antioxidant phenolic chemicals and flavonoids. Accordingly, Oboh et al. [115] reported *Cola accuminata* extracts reduced inflammation in animal studies. The extracts greatly suppressed pro-inflammatory mediators and enzymes, showing their anti-inflammatory potential. The extracts modify inflammatory pathways and inhibit pro-inflammatory molecule production, according to the study. Similarly, Olurishe et al. [116] tested *Cola accuminata* extracts for anti-inflammatory properties in a cell model. The extracts inhibited pro-inflammatory mediators dose-dependently, suggesting anti-inflammatory properties. Bioactive chemicals in the extracts disrupt inflammation signalling pathways, according to the study. Therefore, the phenolic chemicals and flavonoids in the plant neutralize free radicals and reduce oxidative stress. The extracts also suppress pro-inflammatory mediators and enzymes suggesting that *Cola accuminata* may alleviate oxidative damage and inflammation.

6.3 Antidiabetic Activity

Victoria et al. [42] and Osadee [117] tested *Cola accuminata* extracts for anti-diabetic effects in animals. The extracts have strong hypoglycaemic effects, reducing blood glucose. Tannins and flavonoids, which increase the generation of insulin and inhibit carbohydrate-digesting enzymes, may explain *Cola accuminata*'s anti-diabetic effects. Also, Ezejiofor et al. [118] examined *Cola accuminata* extracts' anti-diabetic properties in animal models. The extracts dramatically lowered blood glucose and enhanced insulin sensitivity. Bioactive chemicals in *Cola accuminata* improve glucose absorption and metabolism, according to the study. In a similar study, Boudiba et al. [119] examined *Cola accuminata* extracts' anti-diabetic effects in cellular models, and the results showed that the extracts significantly inhibited the metabolism of carbohydrates and glucose absorption enzymes. These findings imply that *Cola accuminata*'s antidiabetic action may be due to its capacity to inhibit carbohydrate-digesting enzymes, lowering blood glucose release. Thus, the *Cola accuminata* possesses anti-diabetic properties. The tannins and flavonoids in the plant increase insulin synthesis, inhibit carbohydrate-digesting enzymes, and increase glucose absorption, making it hypoglycaemic. These findings suggest *Cola accuminata* could be used to produce antidiabetic medicines.

6.4 Neuroprotective Effects

Imam-Fulani et al. [120] examined *Cola accuminata* extract's neuroprotective properties in animals. The extract improved memory and learning. *Cola accuminata*'s antioxidants minimize oxidative stress and preserve neurons, according to the study. Similarly, Oboh et al. [68] investigated *Cola accuminata* bioactive components' neuroprotective properties. The study examined how these components affect memory and cognition. *Cola accuminata* extract bioactive components protected against loss of memory and dementia. Bioactive chemicals alter neurotransmitter systems and increase neural signalling, according to the researchers. Furthermore, Oboh et al. [121] and Ishola et al. [122] examined how *Cola accuminata* extract protects against brain damage. In animal experiments, the extract reduced oxidative stress and protected neurons. The antioxidant qualities of *Cola accuminata* may help treat and prevent neurological illnesses, according to researchers. Thus, these research demonstrate *Cola accuminata*'s neuroprotection. The plant's antioxidant qualities may protect neurons from oxidative stress and death. *Cola accuminata* improves memory, learning, and cognitive function. These findings show that *Cola accuminata* may provide neuroprotective chemicals for treating and preventing neurodegenerative disorders. However, there is still need to identify and isolate these bioactive chemicals and understand their neuroprotective processes in further researches.

6.5 Anti-cancer Potential

Nugraha et al. [123] examined *Cola accuminata* extract's cytotoxicity on breast cancer cell lines. The extract suppressed breast cancer cell multiplication and induced apoptosis. Bioactive chemicals in *Cola accuminata* may fight cancer, according to the study. *Cola accuminata* was also tested in lung cancer cell lines by Alsaeedi et al. [124]. The extract inhibited lung cancer cell growth and induced apoptosis. *Cola accuminata*'s bioactive ingredients selectively kill cancer cells, according to the study. *Cola accuminata* extract was tested on colon cancer cell lines by Percival et al. [125]. The extract killed colon cancer cells and inhibited cell multiplication. The extract's capacity to alter cell growth and survival signalling pathways may explain its anti-cancer action. In Nugraha et al. [123], the authors examined *Cola accuminata*'s anti-cancer effects in prostate cancer cell lines. The extract inhibited prostate cancer cell multiplication and induced apoptosis. The bioactive chemicals in *Cola accuminata* may suppress prostate cancer cell proliferation by interfering with important biological processes.

6.6 Anti-Ulceric Properties

Cola accuminata extract was tested in rats with aspirin-induced stomach ulcers by Holcombe et al. [126]. The extract reduced ulcer size and improved stomach mucosa histology. The study authors hypothesized that the extract's gastroprotective effects came from increased mucus production, antioxidant defences, and oxidative stress reduction. Nkanu [127] tested *Cola accuminata*'s anti-ulcer effects in different rat ulcer models. The extract reduced gastrointestinal lesions, stomach acid output, and pepsin activity, preventing ulcers. Antioxidant enzymes and gastric mucus increased, indicating better stomach lining protection. Suntar et al. [128] evaluated *Cola accuminata* extract's effects on rats' ethanol-induced stomach ulcers. The extract reduced ulcer index, stomach acid output, and lipid peroxidation to treat ulcers. The extract increased gastric mucin and antioxidant enzyme activity, strengthening the mucosal barrier. These findings imply *Cola accuminata* may treat ulcers. The extract may reduce gastric acid output, protect gastrointestinal mucosa, boost mucus formation, and act as an antioxidant. These ways help the drug preserve the gastric mucosa, heal ulcers, and prevent them. These findings support the traditional usage of *Cola accuminata* to treat ulcers.

6.7 Wound Healing Properties

Ishola et al. [122] and Edwards et al. [129] assert that *Cola accuminata* extract helped to heal and improved wound contraction, size, and re-epithelialization. The extract accelerated wound-healing mechanisms like collagen deposition, angiogenesis, and antioxidant activity, according to the researchers. Agbaje and Charles [130] tested *Cola accuminata*'s wound-healing ability in rats using excision and incision wound models. The extract improved wound closure, tensile strength, and collagen formation. Researchers believed the extract's antioxidant and anti-inflammatory properties helped mend wounds. Diallo et al. [131] tested *Cola accuminata* extract for burn wound treatment in rats. The extract improved wound healing by shrinking wounds, re-epithelializing, and depositing collagen. The extract stimulated fibroblast proliferation and migration, improving wound healing. Scientists believed the extract's angiogenesis and anti-inflammatory effects helped mend wounds. These trials confirm *Cola accuminata*'s wound dressing efficacy. This extract promotes wound healing, re-epithelialization, collagen production, antioxidants, and anti-inflammation. Its wound-healing capabilities make it a viable natural therapy.

7 Some Herbal Formulations Involving *Cola accuminata* as Active Ingredients

Traditional and folk medicine uses herbal preparations using *Cola accuminata* as an active ingredient. These compositions mix *Cola accuminata* with other plant-based substances for synergistic effects and improved medicinal results. Some example of *Cola accuminata* herbal formulations in Nigeria are shown below.

7.1 Agbo Formulation

Nigerian herbalists use agbo to cure a variety of diseases. *Cola accuminata* is mixed with medicinal herbs. Akande et al. [132] tested an agbo formulation with *Cola accuminata, Morinda lucida*, and *Alstonia boonei* for antibacterial activity. This herbal formulation inhibited Gram-positive and Gram-negative bacteria, confirming its traditional use.

7.2 Ewuro-Ajekobale Formulation

Yoruba folk medicine practitioners in Nigeria treats diabetes using Ewuro-Ajekobale formulation. This formulation contains *Cola accuminata*, bitter leaf (*Vernonia amygdalina*), and wild tomato (*Solanum torvum*). Musabayane et al. [133] examined the hypoglycaemic effects of the formulation in diabetes animal models and this herbal composition showed considerable blood glucose decreases, indicating its diabetes management potential.

7.3 Ciklavit Herbal Preparation

Traditional Yoruba medicine practitioners treats menstruation issues with this herbal preparation. It has *Cola accuminata, Citrus aurantifolia*, and other therapeutic herbs. Ciklavit was tested on experimentally induced menstruation problems in female rats by Cyril-Olutayo et al. [134], and its anti-inflammatory and analgesic properties supported its use in menstrual problems.

7.4 Agbo-Iba

Yoruba traditional medicine uses a herbal concoction called Agbo-Iba to treat fever and malaria. *Cola accuminata* is combined with A*zadirachta indica* and *Mangifera indica*, two more therapeutic plants. Nwabuisi [135] examined the efficacy of the Agbo-Iba formulation against plasmodium. The findings provided strong evidence for its traditional use as an antimalarial treatment, showing considerable reduction of *Plasmodium falciparum* development.

7.5 Orogbo Formulation

This herbal mixture is used in traditional medicine to treat gastrointestinal problems like diarrhoea and dysentery. It includes *Cola accuminata* together with *Garcinia kola* and *Vernonia amygdalina*, both of which are plants. Odukanmi et al. [136] evaluated the effectiveness of the *Cola accuminata* in preventing diarrhoea in animal models. Supporting its traditional use, the extract significantly reduced the frequency and severity of diarrhoea.

7.6 Opa Eyin Formulation

Traditional healers rely on this herbal concoction to treat skin diseases and wounds. Included are *Newbouldia laevis* and *Cola accuminata*, both of which have medicinal uses. The Opa Eyin formulation's antibacterial efficacy against several bacteria and fungi was studied by Bolawaa et al. [137]. Significant inhibitory effects were seen against the investigated microorganisms, suggesting that the formulation may be useful in the treatment of skin infections.

7.7 Agbo-Jedi Formulation

The formulation is a traditional herbal concoction with aphrodisiac effects, widely used in traditional medicine. *Cola accuminata* is combined with *Mondia whitei* and *Citrullus colocynthis*, two other therapeutic plants. Akinboro et al. [138] and Adeyemi et al. [139] examined the aphrodisiacal efficacy of the Agbo-Jedi formulation. The traditional use of the mixture as an aphrodisiac was supported by the data showing a considerable increase in sexual behaviour and reproductive indices.

7.8 Agbo-Atosi Formulation

This is a herbal concoction used in Nigerian folk medicine to treat hypertension. *Cola accuminata* is combined with other therapeutic herbs like aloe barbadensis and onion. Eiya and Igharo [140] and Akande et al. [132] looked into the antihypertensive effects of the Agbo-Atosi formulation and reported that the formulation had promising antihypertensive effects, with blood pressure levels significantly reduced.

7.9 Oroki Formulation

This herbal formulation with hepatoprotective qualities is widely utilized in traditional medicine in Nigeria. It includes therapeutic herbs like *Cola accuminata* and Garcinia kola. Emeleku [141] evaluated the Oroki formulation's hepatoprotective efficacy in animal models. The formulation showed promising results in protecting against hepatotoxicity, indicating its potential in managing liver health.

7.10 Osomo Formula

Osomo is a local herbal aphrodisiac. It contains *Cola accuminata* and *Allium sativum/cepa*. Adeyemi and Owoseni [142] examined the polyphenolic content and biochemical evaluation of the formulation and reported the formulation showed significant composition of the parameters assessed, thereby supporting the traditional use of this formulation as an aphrodisiac.

7.11 Epa-Ijebu Formulation

This is a traditional herbal concoction with aphrodisiac characteristics that is utilized in most traditional medicine. *Cola accuminata* is combined with *Mondia whitei* and *Carpolobia lutea*, two other therapeutic herbs. The aphrodisiac effects of the Epa-Ijebu combination were tested on animals in a study by Enitan [143]. The combination was shown to significantly improve sexual performance and libido, lending credence to its historical role as a natural aphrodisiac [143]. In summary, *Cola accuminata* has a wide variety of uses in traditional herbal formulations, as evidenced by these examples. It is commonly used for its aphrodisiac, gastrointestinal health, anti-malarial, and anti-inflammatory properties.

8 Safety Considerations and Side Effects of *Cola accuminata*

Some of the safety considerations and side effects of consuming *Cola accuminata* to be discussed under this subhead are shown in Fig. 4.

8.1 Caffeine Content

The plant *Cola accuminata*, among others, has the naturally occurring chemical caffeine. It has been scientifically proven to stimulate the central nervous system. Most people can manage modest amounts of caffeine with no problems, but too much can have negative effects. *Cola accuminata*'s caffeine level is a major cause for concern because of its link to irritability and nervousness. Caffeine in excess can overstimulate the nervous system, causing irritability, nervousness, and even anxiety. Caffeine use has been linked to both difficulty falling asleep and maintaining a restful slumber [144]. One of the negative effects of consuming too much caffeine is a rapid heartbeat. Caffeine causes a transient increase in heart rate due to its stimulatory action on the cardiovascular system. This effect may be more

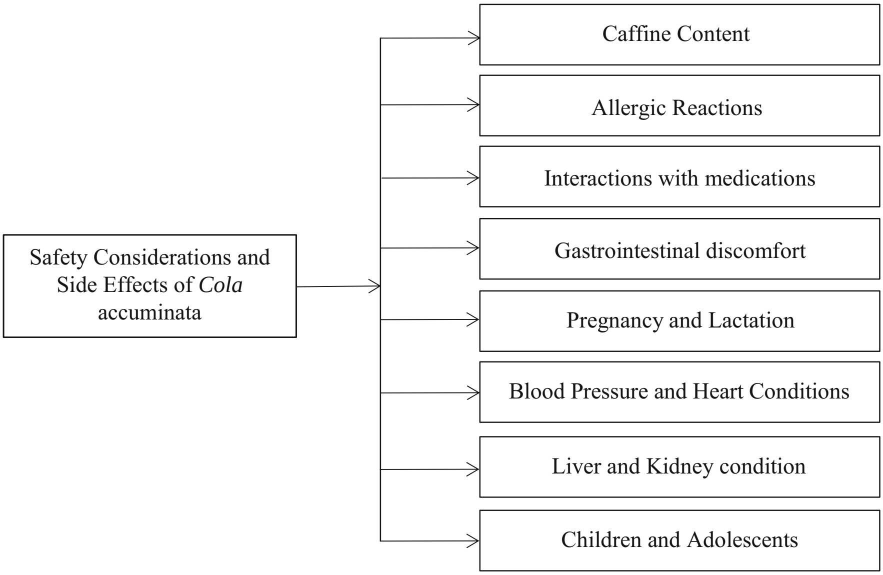

Fig. 4 Safety considerations and side effects of *Cola accuminata*

pronounced in caffeine-sensitive people or people with pre-existing heart issues and may cause palpitations or abnormal heart rhythms [144].

Another common negative reaction to caffeine overdose is gastrointestinal distress. Caffeine increases stomach acid production, which can lead to indigestion, heartburn, and other gastrointestinal distress. It may also have minor diuretic effects, resulting to increased urine production and frequency in certain people [145, 146]. Thus, caffeine tolerance varies greatly from person to person. People with pre-existing problems like heart disease, high blood pressure, or gastrointestinal issues may be particularly vulnerable to the negative effects of caffeine. Nehlig [144] stressed the importance of moderation in caffeine consumption, including *Cola accuminata*, in order to reduce the risk of adverse consequences.

Nevertheless, *Cola accuminata* can be consumed safely provided that consumers are aware of their unique caffeine sensitivity and take into account their total caffeine intake from sources like coffee, tea, and other caffeinated beverages or meals. People who are more susceptible to caffeine's effects or who have health issues that can be made worse by caffeine should cut back on their intake [144].

8.2 Allergic Reactions

Although it is uncommon for people to have an adverse reaction to *Cola accuminata*, it is nonetheless vital to be aware of the possibility. An allergic reaction occurs when the immune system overreacts to a normally harmless chemical. Symptoms of an allergy can present in a number of ways, including on the skin, in the lungs, or throughout the body. Some people have severe allergic reactions to *Cola accuminata*, including hives, swelling of the face and throat, and trouble breathing, which can occur after eating or touching the plant. These reactions to *Cola accuminata*'s allergenic components might manifest themselves quickly or build up over time [147]. Hence, there is a need to stop using *Cola accuminata* and get medical help right away if an allergic reaction is imminent. As such, products containing *Cola accuminata* should be used with caution by people with allergies or a history of adverse reactions. In these circumstances, it is best to talk to a doctor or allergist about getting tested for allergies and getting advice on how to consume *Cola accuminata* safely. *Cola accuminata* allergies appear to be uncommon because people rarely report experiencing negative reactions to the plant. However, when drinking or coming into contact with *Cola accuminata*, it is crucial to remain cautious and respond appropriately to any indicators of allergic reactions.

8.3 Interactions with Medications

Cola accuminata's bioactive ingredients, such as caffeine, may interfere with the effectiveness of several pharmaceuticals. These interactions might lessen or heighten the likelihood of desired results, depending on the drugs involved. If you are currently taking any drugs, you should discuss using *Cola accuminata* with your doctor because of the possibility of drug interactions. One of *Cola accuminata*'s most significant components, caffeine, can interfere with the effectiveness of drugs used to treat heart disease, mental illness, and breathing problems. Because of the potential impact on the safety of patients and treatment outcomes, Baur et al. [148] emphasized the need of taking into account such interactions.

Beta-blockers, used to treat hypertension and other cardiovascular disorders, may have an adverse reaction to caffeine. The blood pressure-lowering benefits of beta-blockers may be diminished by caffeine consumption [149]. Caffeine can also have an influence on the metabolism of, or increase the risk of side effects associated with, certain psychiatric drugs, including selective serotonin reuptake inhibitors (SSRIs) and lithium [150]. In addition, caffeine can interact with bronchodilators like theophylline, which are used to treat respiratory disorders. Theophylline's negative effects can be amplified by caffeine, leading to a faster heart rate and tremors [151]. Given the potential for negative interactions with other medications, it is best to check with a doctor before using *Cola accuminata*.

8.4 Gastrointestinal Discomfort

Intestinal distress has been reported in a small number of people who have used *Cola accuminata* or its extracts. Caffeine and other components of the plant may contribute to uncomfortable side effects such gastrointestinal distress, heartburn, and diarrhoea. One of the primary ingredients of *Cola accuminata* is caffeine, which has been shown to stimulate the digestive system, leading to more gastric acid output and possibly stomach discomfort [145]. In addition, some people may experience diarrhoea as a result of the laxative effects of caffeine [152]. Some people may be more susceptible to caffeine's gastrointestinal side effects than others.

Cola accuminata has a number of chemicals that can affect gastrointestinal function, including caffeine, tannins, and polyphenols. Particular tannins have been linked to astringent characteristics and the potential to cause gastrointestinal discomfort in some people [153]. *Cola accuminata* preparations include several chemicals, which may cause gastrointestinal distress in those who are sensitive to them. It is important to note that the amount of *Cola accuminata* consumed, individual tolerance, and pre-existing gastrointestinal problems may all have a role in the occurrence and severity of gastrointestinal discomfort. As a result, you should pay attention to how your body reacts and make dietary adjustments accordingly.

8.5 Pregnancy and Lactation

Caffeine, a popular stimulant found in *Cola accuminata*, can enter the foetal circulation after crossing the placenta [154]. A higher likelihood of miscarriage, premature birth, low birth weight, and issues with growth have all been linked to maternal caffeine consumption during pregnancy [155]. Infants of moms who drink too much coffee may develop behavioural and sleep problems and experience abdominal distress as a result [144]. Given the current state of knowledge, expectant and nursing mothers should proceed with caution while consuming *Cola accuminata* or items containing it. It is best to talk to a doctor about your specific situation and any hazards involved so you can make an educated choice.

The dearth of particular studies on this plant in pregnant and breastfeeding women is largely to blame for the scarcity of data on the safety of *Cola accuminata* at these stages of a woman's life. In order to protect the health of both mother and child, healthcare providers normally recommend that pregnant and nursing women limit their caffeine intake from all sources, including *Cola accuminata*.

8.6 Blood Pressure and Heart Conditions

Cola accuminata contains caffeine, which has been shown to temporarily increase heart rate and blood pressure. People who have hypertension or cardiovascular disease should use caution when consuming *Cola accuminata* or products containing it, and should keep an eye on their blood pressure and heart rate. In these situations, you should talk to a doctor before using *Cola accuminata*. The stimulant effects of caffeine on the central nervous system are accompanied by a transient elevation in blood pressure and heart rate [156]. This reaction is temporary and is felt by the vast majority of people. However, those who already have hypertension or heart problems may be more susceptible to caffeine's negative effects.

Caffeine can induce a transient increase in blood pressure, thus those with hypertension should be careful about how much they drink [157]. Caffeine, particularly *Cola accuminata* products, should be limited by people with hypertension in order to maintain healthy blood pressure levels. Maintaining a blood pressure reading within a healthy range requires regular monitoring. Caffeine should also be consumed with caution by those who have heart disorders such as arrhythmias or coronary artery disease. Some cardiac arrhythmias may be triggered or made worse by caffeine, and caffeine may also increase the heart's workload [156]. Before taking *Cola accuminata* or products containing it, those with heart issues should talk to a doctor about the possible effects on their condition.

8.7 Liver and Kidney Condition

Cola accuminata or goods containing it should be consumed with caution by people with liver or kidney disorders. *Cola accuminata*'s presence of caffeine and other chemicals may have an impact on several body systems. In these situations, you should talk to a doctor before using *Cola accuminata*. The liver and kidneys are essential organs for detoxification and waste removal. Caffeine, a stimulant, can affect several systems because of its metabolism and excretion. Caffeine and other substances may not be processed properly by people with liver or kidney disorders, which could have negative consequences. Changes in indicators of liver and kidney function were observed in rats given *Cola accuminata* extract in a study by Olatunji et al. [158]. The study authors cautioned against using *Cola accuminata* for anyone who already has liver or kidney disease.

Some people may have a diminished ability to metabolize caffeine due to liver diseases such as liver disease or poor liver function. Extended contact with caffeine, or its build-up, has been linked to hepatic stress [150]. Caffeine and its metabolites may also have an effect on renal function in those with kidney disorders such as chronic kidney disease or impaired kidney function [150]. Individuals with pre-existing liver or kidney issues should not consume *Cola accuminata* or products containing it without first consulting a healthcare expert. A medical specialist is most equipped to analyse an individual's health situation, weigh the pros and downsides, and recommend a safe dosage or alternate treatment.

8.8 Children and Adolescents

Due to its caffeine level and potential effects on developing bodies, children and adolescents should consume *Cola accuminata* moderately. Caffeine can impact sleep, growth, and health in this population. *Cola accuminata* should not be used in children and teenagers without medical advice. Caffeine, a stimulant, affects children and adolescents more than adults. Children and teenagers may be particularly sensitive to caffeine due to their developing bodies. Caffeine can alter sleep patterns and make it hard to fall and remain asleep [159]. Sleep disturbances can harm children and teenagers' growth, cognition, and well-being. In addition to sleep disruptions, high coffee intake in this population may impact growth and development. Caffeine can lower adolescent bone mineral density, which can lead to osteoporosis later in life [159]. Caffeine can also impair nutritional absorption, which could impede growth and development.

Caffeine may potentially harm kids' cardiovascular health. In people with cardiovascular problems, excessive caffeine can raise heart rate and blood pressure [159]. Some people may be more sensitive to caffeine's stimulating effects. Given these concerns, *Cola accuminata* should be limited in children and adolescents and used under medical supervision. A doctor can advise on the right amount of caffeine for this population and weigh the dangers and benefits.

9 Commercial Properties of *Cola accuminata*

Cola accuminata has the potential to be economically valuable and used in a wide range of businesses thanks to its commercial features. This includes its uses in the nourishment and beverage sector, the pharmaceutical sector, and the cosmetics sector to mention but a few (Fig. 5). Let us go into greater depth about these investment properties for businesses, using appropriate sources.

9.1 Food and Beverage Industry

Cola accuminata has been used for decades in the food and beverage industry as a flavouring agent in the creation of carbonated beverages such as cola drinks. The addition of caffeine and other bioactive components gives these drinks their own unique flavour. Candies, chocolates, and desserts all benefit from the addition of *Cola accuminata* extracts and infusions [160]. *Cola accuminata*'s natural components make it a valuable commodity in the food and drink sector.

9.2 Pharmaceutical Industry

The pharmaceutical sector is interested in *Cola accuminata* because of its possible therapeutic characteristics. The pharmacological effects of the bioactive chemicals found in *Cola accuminata* have been extensively researched. As previously mentioned, these effects can be broken down into four categories: antioxidant, anti-inflammatory, antimicrobial, and anti-cancer [31, 68, 122, 161]. Because of these

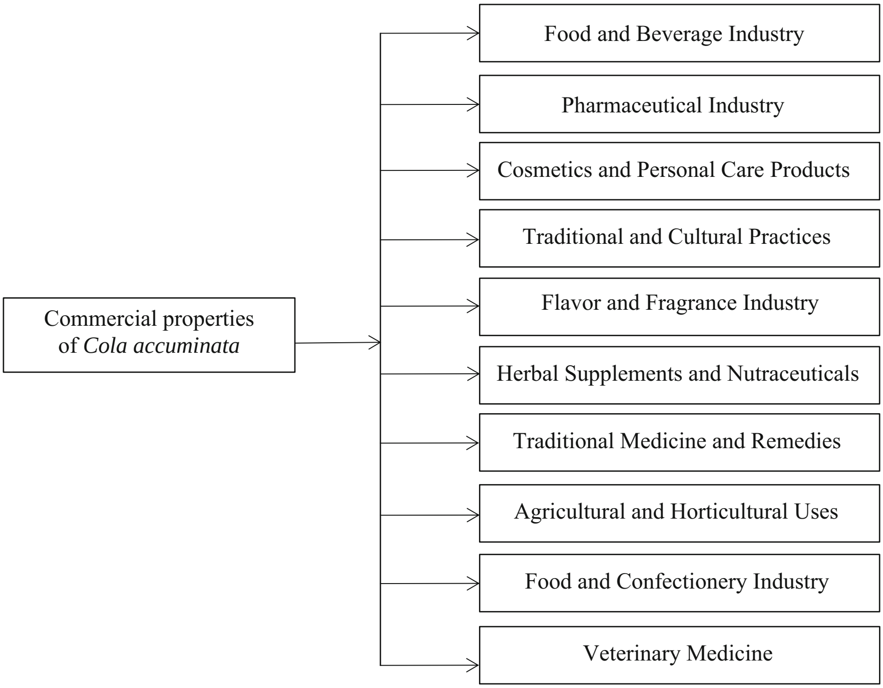

Fig. 5 Commercial properties of *Cola accuminata*

qualities, *Cola accuminata* is a promising ingredient in the creation of natural pharmaceuticals and functional meals.

9.3 Cosmetics and Personal Care Products

Extracts from the *Cola accuminata* plant are used in the cosmetics business. *Cola accuminata*'s antioxidant properties make it a promising addition to cosmetics. The skin benefits from antioxidants because they shield it from oxidative stress, which is linked to aging and environmental damage. To give antioxidant advantages and support healthy skin, *Cola accuminata* extracts can be added into formulations including creams, lotions, etc. The trend towards organic and all-natural cosmetics and toiletries necessitates the usage of natural substances like *Cola accuminata*. Extracts from the *Cola accuminata* plant are used in the production of a wide variety of cosmetics and toiletries. Because of its high antioxidant content, this plant is a welcome addition to many topical skincare formulations. Extracts from the *Cola accuminata* plant have been shown to reduce the effects of oxidative stress on the skin and to boost its appearance in youth [162, 163].

9.4 Traditional and Cultural Practices

Cola accuminata has cultural and traditional value in several locations in addition to the economic purposes described above. *Cola accuminata* has spiritual and ceremonial significance in various societies. *Cola accuminata*, from which the cola nut is harvested, is utilized in religious ceremonies and as a sign of hospitality and brotherhood [164, 165]. *Cola accuminata*'s social and symbolic worth is enhanced by these cultural practices.

9.5 Flavour and Fragrance Industry

Extracts and oils from the *Cola accuminata* plant are used to give products a cola-like aroma and flavour in the flavour and fragrance business. Perfumes, colognes, and other scented goods make use of *Cola accuminata* for its distinctive aroma. *Cola accuminata*'s singular aroma profile enhances the complexity and depth of perfumes in many forms [14, 104].

9.6 Herbal Supplements and Nutraceuticals

Nutraceuticals and herbal supplements made with *Cola accuminata* are becoming increasingly popular. Caffeine and other bioactive chemicals in it suggest it could be used in energizing supplements and medicines. Stimulant effects, cognitive enhancement, and general health benefits are all possible selling points for these items [106]. The incorporation of *Cola accuminata* in such products meets the rising demand for organic and plant-based options in the supplement market.

9.7 Traditional Medicine and Remedies

Cola accuminata plays a significant role in some regions' traditional medicine systems. *Cola accuminata* is used by traditional healers and practitioners to treat a wide range of problems, including gastrointestinal issues, weariness, and lack of concentration [42]. It has aphrodisiac powers, at least in the eyes of some societies. *Cola accuminata* has commercial value since it is used in traditional medicine, which is still common in some cultures.

9.8 Agricultural and Horticultural Uses

The *Cola accuminata* tree has numerous practical applications in agriculture and horticulture. Insects and other pests can be kept away from crops thanks to substances found in the plant's seeds and husks [166, 167]. Because of its historic value and visually appealing foliage, *Cola accuminata* is also occasionally cultivated as an ornamental tree.

9.9 Food and Confectionery Industry

Cola accuminata is used to improve the flavour and scent of many foods and sweets in the food and confectionary industries. To give baked products, candies, chocolates, ice creams, and other sweets with the familiar cola flavour, cola flavouring is often added. Energy bars and other functional food products can benefit from *Cola accuminata*'s naturally occurring caffeine [168].

9.10 Veterinary Medicine

Potential uses of *Cola accuminata* extracts in veterinary medicine have been investigated. Their potential to fight against various animal diseases and antimicrobials are being researched. *Cola accuminata*'s bioactive components have therapeutic potential for animal wellness and good health [158].

10 Conclusion

Cola accuminata, or the Cola nut, is a plant that has been used traditionally and holds great cultural significance in many parts of the world. *Cola accuminata*'s phytochemical components, nutritional profile, scientifically confirmed pharmacological qualities, ethnomedicinal applications, safety concerns, and commercial value have all been discussed at length. These results demonstrate the many uses and benefits of this plant. *Cola accuminata* has been shown to contain a number of bioactive substances, such as alkaloids, tannins, flavonoids, phenolic compounds, and caffeine. The plant's antioxidant, anti-inflammatory, antibacterial, anti-cancer, and neuroprotective benefits can be attributed in part to these components. *Cola accuminata* may have medicinal uses in the treatment and prevention of disease due to the presence of certain phytochemicals.

Carbohydrates, proteins, lipids, vitamins, and minerals are just some of the many nutrients that *Cola accuminata* is a good source of. The energizing effects of the caffeine in it might help you stay awake and focused. Caffeine is a stimulant, but consuming too much of it can cause negative side effects like irritability, nervousness, and a faster heart rate. So, it is best to take it easy sometimes.

The use of *Cola accuminata* in traditional and folk medicine dates back many centuries. It has been used for its stimulating effects, and it may also help with things like memory and focus, digestion, and wound healing, among other things. Several of these traditional applications have been validated by scientific studies, demonstrating the plant's usefulness in a variety of contexts. However, there are a number of factors that must be taken into account while determining the safety of *Cola* *accuminata*. *Cola accuminata*, like other caffeine-containing drinks, can cause a variety of unwanted side effects if consumed in large quantities. *Cola accuminata* should be used with caution and in consultation with medical specialists by people with certain health issues, including cardiovascular illnesses, psychological conditions, liver or renal conditions, and pregnancy or lactation.

Cola accuminata has substantial commercial value. It is a staple in the beverage industry, where it is used to impart the signature cola flavour and natural caffeine content into classic cola drinks. The plant is used in a wide variety of other contexts, such as aromatherapy, veterinary medicine, the cosmetics and personal care industries, and the food and confectionary industries. Its distinctive aroma, flavour, and bioactive qualities all add to its commercial value and popularity as a formulating component. Nevertheless, more study is needed to determine its full potential and how best to apply it to enhance human health and well-being.

Abstract

Citrus aurantium, commonly referred to as sour orange or bitter orange, holds significant importance both in biological and economic terms. Throughout history, humans have turned to nature in their pursuit of health and wellness. Among the plants that have historically played a role in enhancing fitness, *Citrus aurantium* stands out. A diverse array of phytochemical constituents present in *Citrus aurantium* have been closely tied to its various biological activities, encompassing areas such as gastrointestinal disorders, insomnia, headaches, cancer treatment, antiseptic properties, antioxidant effects, and antispasmodic effects. Beyond its pharmacological relevance, *Citrus aurantium* also boasts numerous non-pharmacological applications that make it particularly intriguing. It serves as a food preservative agent, contributes to aromatherapy practices, acts as a pesticide, provides raw materials for the pulp and paper industry, lends its aromatic qualities to the food processing and cosmetics sectors, and offers potential as an anti-aging agent. Despite its impressive array of properties, the utilization of *Citrus aurantium* and its derivatives has been linked to certain unwanted side effects. While some studies have largely cleared the plant of safety concerns, others have cast doubt on its safety. This chapter delves into the complex aspects surrounding the safety of *Citrus aurantium*'s phytochemistry and its derived products. Ultimately, the chapter advocates for the ongoing use of this plant, but with a careful awareness of its limitations to prevent any undesirable effects.

Keywords

Citrus aurantium · Bitter orange · Phytochemicals · Non-pharmacological uses · Economic relevance

Abbreviations

ALT	Alanine transminase
AMPKα	Activated protein kinase alpha
AMPKα	AMP-activated protein kinase alpha
AST	Aspartate aminotransferase
CAVAPs	Crude polysaccharides of *C. aurantium* L. var. Amara Engls
DPPH	2,2-Diphenyl-1-picrylhydrazyl
ERK	Extracellular signal- regulated kinase
EtOAc	Ethyl acetate
FAS	Fatty acid synthase
FDA	Food and Drug Administration
FRAP	Ferric reducing antioxidant power
GGT	Gamma-glutamyl transferase
GSK3β	Glycogen Synthase Kinase 3 Beta
IL-1β	Interleukin-1β
IL-6	Interleukin 6
iNOS	Inducible nitric oxide synthase
JNK	c-Jun N-terminal kinase
MAPK	Mitogen-activated protein kinase
MTD	Maximum tolerated dose
NAFLD	Non-alcohol fatty liver disease
NASH	Non-alcoholic steatohepatitis
NF-kB	Nuclear factor kappa B
NOAEL	No-observed-adverse-effect-level
NOEL	No-observed-effect-level
Nrf2	Nuclear factor erythroid 2-related factor 2
ORAC	Oxygen radical absorbance capacity
PGC-1α	PPARγ co-activator 1α
PTFC	Pure total flavonoids from citrus
SCD1	Stearoyl-CoA desaturase 1
TAC	Total antioxidant capacity
TBARS	Thiobarbituric acid reactive substances
TNF- α	Tumor necrosis factor α
UCP1	Uncoupling protein-1
WADA	World Anti-Doping Agency

1 Introduction

Citrus fruits stand apart due to their unique structural composition, which includes seeds, pulp, oil cells, and a white membrane layer [1]. These fruits are remarkable sources of essential nutrients such as vitamin C, bioactive flavonoids, and folic acid. These components play diverse roles in reducing inflammation and enhancing the body's immune system. Native to Australia, Malaysia, New Caledonia, and a few other countries, *Citrus aurantium*, commonly known as sour orange, has a significant geographical presence [2]. Over time, it was cultivated in regions including Spain, France, North and South Africa, and various other parts of the tropical and temperate world, owing to its robustness compared to other Citrus species [2]. Among the cultivars of *Citrus aurantium*, '*Citrus aurantium* Changshanhuyou' (CACH) stands out. This cultivar is the result of a hybridization process involving *Citrus grandis* and *C. sinensis* [1].

In recent years, there has been a notable increase in citrus production, leading to a greater focus within the fruit processing industries on creating various products such as juices, essential oils, flavorings, antioxidants, and acidifying ingredients for food applications [2]. However, these advancements generate a substantial amount of solid waste from citrus, including peels, seeds, and membrane residue, during the processing stage. This solid waste from citrus is not without value, as it can be recycled and put to various uses, primarily serving as a source of beneficial phytochemicals, vitamins, and minerals that have potential applications in treating various health conditions [2].

Furthermore, the fruits of *Citrus aurantium* (*C. aurantium*) offer more than just essential oils; they also contain compounds of the flavonoid type, which exhibit a range of biological effects. These compounds contribute to the fruit's health-promoting qualities, including antioxidative, antibacterial, antiallergic, anticancer, and antidiabetic properties [1–3]. *C. aurantium* has been utilized in traditional Chinese medicine to address various health issues such as anxiety, cancer (particularly lung and prostate), digestive problems, and obesity. Additionally, its uses extend to serving as a stimulant, appetite suppressant, and remedy for motion sickness, indigestion, and constipation [2, 4]. Moreover, it has been explored for treating cancer and cardiovascular diseases [2]. Notably, the aroma of its essential oils has been harnessed to induce sleep in individuals prone to insomnia [5–7], and these oils also exhibit potent pesticidal properties [3, 8–10].

Beyond its compelling biological significance, *C. aurantium* possesses intriguing non-pharmacological attributes. Its essential oils, for instance, display antimicrobial and antioxidant characteristics, rendering them valuable as natural food preservatives [11]. Furthermore, due to its exceptional qualities, *C. aurantium* serves as a suitable raw material for producing pulp and paper [12]. Industries such as food processing and cosmetics also harness its aromatic nature [13–15]. Moreover, *C. aurantium* has found relevance in skin treatments, particularly as an anti-aging agent [16].

The prominence of *Citrus aurantium* has increased, notably as a replacement for weight-loss products previously utilizing *Ephedra sinica* Stapf. in Farw., as it contains p-synephrine, an alkaloid of the phenylethanolamine type. This compound has hunger-suppressing effects and shares a chemical relationship with adrenergic medications [3]. The protoalkaloid p-synephrine has garnered attention for its use in weight loss and athletic supplements, as well as potential risks associated with its consumption [17–19]. Although certain studies have largely absolved *Citrus aurantium* and p-synephrine of reported risks, safety concerns remain [18, 20–22]. Recent scientific research has extensively explored the potential effects of various parts of *Citrus aurantium*, including its blossoms, fruits, and essential oils [3].

This chapter provides a comprehensive discussion of the phytochemistry, pharmacological and non-pharmacological potentials, safety considerations, and research gaps related to *Citrus aurantium*. The aim is to evaluate the current scientific endeavors focused on toxicological assessments of the plant, while also setting the groundwork for future research initiatives.

2 Overview of the Non-pharmacological Uses of *Citrus aurantium*

2.1 The Role of *Citrus aurantium* in Food Preservation

The interest in natural preservatives has increased tremendously due to the undesirable tendencies of synthetic preservatives [23]. Owing to its antimicrobial and antioxidant properties, the essential oil of *Citrus aurantium* has become an attractive alternative to the use of synthetic preservatives [11]. This section explores the antimicrobial and antioxidant properties of *Citrus aurantium* in a view to appraising its food preservative potentials.

2.1.1 Antibacterial Properties of *Citrus aurantium* and Its Food Preservative Potential

Citrus aurantium essential oil is a terpenoid-rich mixture with antibacterial effect, claim Anwar et al. [11]. The plant's phytochemicals' close interaction with the target cell and subsequent solubilization of the cell membrane give rise to the plant's antibacterial characteristics. In a study conducted by Ben Hsouna et al. [24], it was discovered that *Citrus aurantium* contains the following monoterpenes: 27.5% limonene, 14% terpineol, 4.3% E-ocimene, and 2.4% delta-3-carene. Sesquiterpenes are said to make up 30.2% of the essential oil, with (E)-nerolidol having the highest concentration (17.5%). Several bacteria and fungi, including *Candida albicans*, *Staphylococcus epidermis*, and *Escherichia coli*, have been demonstrated to be suppressed by terpineol [11]. The essential oils of *Citrus aurantium* were investigated for their antibacterial activity against a panel of 13 bacterial strains using agar diffusion and broth microdilution procedures. According to the findings [24], the plant's essential oils exhibit a moderate-to-strong antibacterial activity. The antibacterial efficacy of *Citrus aurantium* essential oil against the two foodborne pathogens *Escherichia coli* and *Salmonella enterica* in apple juices was studied by Friedman et al. [25] in 2004. The capacity of the essential oil to preserve food was demonstrated by their discovery that it was effective against the two bacteria developing in the apple juice. Additionally, *Pseudomonas fluorescens* and *Aeromonas hydrophila*, two bacteria that can ruin fish, were discovered to be resistant to the antibacterial effects of *Citrus aurantium* essential oils. The antibacterial activity was determined by measuring the MIC using the disc diffusion method at two temperatures, including the bacteria's optimal temperature (30 °C or 37 °C) and the refrigerated temperature (4 °C). As a food preservative, the essential oil was demonstrated to be effective at both temperatures against the intended bacteria [26].

2.1.2 Antifungal Properties of *Citrus aurantium* and Its Food Preservative Potential

Many fungi, including *Aspergillus niger*, *Aspergillus flavus*, *Aspergillus nidulans*, *Aspergillus fumigants, Fusarium graminearum*, *Fusarium oxysporum*, *Fusarium culmorum,* and *Alternaria alternate,* are known to be responsible for food spoilage [24]. Therefore, an agent that can inhibit the growth of these fungi will do well as a food preservative. Fortunately, the essential oils of *Citrus aurantium* have shown profound antifungal activity by inhibiting the growth zone of the above-mentioned fungi. The antifungal capacity of *Citrus aurantium* has been attributed to the limonene and (E)-nerolidol content of the essential oils [27]. Therefore, the essential oils of *Citrus aurantium,* particularly the limonene and (E)-nerolidol isolates, would serve well as a food preservative agent.

2.1.3 Antioxidant Properties of *Citrus aurantium* and Its Food Preservative Potential

Antioxidants are known to limit food spoilage by preventing the autoxidation of pigments, flavors, lipids, and vitamins [28]. The essential oils of *Citrus aurantium* have shown profound antioxidant properties that can be harnessed as a food preservation [24, 29, 30]. Furthermore, the peel and fruit juice of *Citrus aurantium* have been demonstrated to possess antioxidant properties [31, 32]. The antioxidant properties of *Citrus aurantium* were confirmed via the 2, 2-diphenyl-1-picrylhydrazyl (DPPH) assay, β-carotene bleaching test, total antioxidant capacity (TAC) assay, and thiobarbituric acid reactive substance (TBARS) assay [24, 29–32]. Indeed, the collective antioxidant properties of *Citrus aurantium* suggest its use as a food preservative agent in the food industry.

2.2 The Role of *Citrus aurantium* in Aromatherapy

The non-pharmacological therapeutic use of essential oils derived from aromatic plants is known as aromatherapy. Aromatherapy has been used to treat a variety of ailments, including body aches, nausea, vomiting, anxiety, melancholy, stress, and insomnia [33]. Due to their high volatility, citrus essential oils can alter the body's hemodynamic parameters or blood flow via controlling circulation via the autonomic nervous system [33]. In particular, the inhalation of *Citrus aurantium* has been observed to possess sedative, hypnotic, and anti-anxiety properties [34, 35]. Furthermore, *Citrus aurantium* essential oils have been used to improve sleep quality in type 2 diabetes mellitus patients, pregnant women, and postmenopausal women [5–7]. Given its ability to improve sleep quality in the above-stated conditions, its effects on several other conditions that distort sleep quality in humans can be assessed.

2.3 The Role of *Citrus aurantium* in Pulp and Paper Production

One major drawback in pulp and paper production is the insufficiency of raw materials [12]. Two main attributes distinguish the *Citrus aurantium* tree as a suitable raw material for pulp and paper production viz its fast growth and chemical composition. In particular, the high cellulose and holocellulose content and low lignin content, which is essential for paper production, stands *Citrus aurantium* out in paper production [12]. Therefore, the *Citrus aurantium* tree stands as a good raw material for pulp and paper production.

2.4 The Role of *Citrus aurantium* in Food Processing and Cosmetics Industries

Citrus aurantium has mostly been investigated as a flavoring additive by the food processing sectors. In addition to alcoholic and non-alcoholic beverages, marmalades, ice cream, sweets and candies, soft drinks, gelatins, and cakes, it has also been used to impart aroma to culinary products [14, 15]. As well as being used to make infusions, *Citrus aurantium* blossoms are also utilized to make perfumes and cosmetics thanks to the essential oil they yield [13]. Additionally, *Citrus aurantium* fruit peel is used to make marmalade, and the fruit's juice is added to salads to provide a tart flavor [36]. Finally, *Citrus aurantium* is a component of some South American and Asian recipes, including yoghurt-based side dishes and hot soups with salt and pepper [37].

2.5 The Role of *Citrus aurantium* in Pesticides Production

Various plant parts have demonstrated pesticidal potentials particularly for the control of mosquito larva [38–42]. Furthermore, essential oils and an isolated part of *Citrus aurantium* have been found to have highly potent pesticidal effects. *Citrus aurantium* and limonene, an isolated component, were found to have fumigant activity against *Bemisia tabaci* (silverleaf whiteflies) in an in vitro experiment and to cause insect mortality between 41.00 and 47.67% within 24 h of exposure at 2.5 and 20.0 l/L air concentration [9, 43, 44]. Additionally, it was found that after 24 h of exposure, *Citrus aurantium* essential oil had a larvicidal effect with LC50 and LC90 values of 22.64 and 83.77 mg/L, respectively [8, 45]. The active component was found to be limonene, and *Citrus aurantium* fresh peeled ripe fruit had potent larvicidal effect against the mosquito vector *Anopheles stephensi* at an LC50 value of 31.20 ppm [3]. *Citrus aurantium* essential oils have also been effective in controlling rice weevils and saw-toothed grain insects [10].

3 Phytochemistry and Bioactive Compounds of *Citrus aurantium*

The well-known pharmacological or therapeutic potentials of plants such as antimicrobial, anti-cancer, antiproliferative, hypolipidemic, and cardio-protective effects are associated with the secondary metabolites, or phytochemicals they possess [42, 46–52]. There are a ton of different chemicals in the *C. aurantium* plant. The

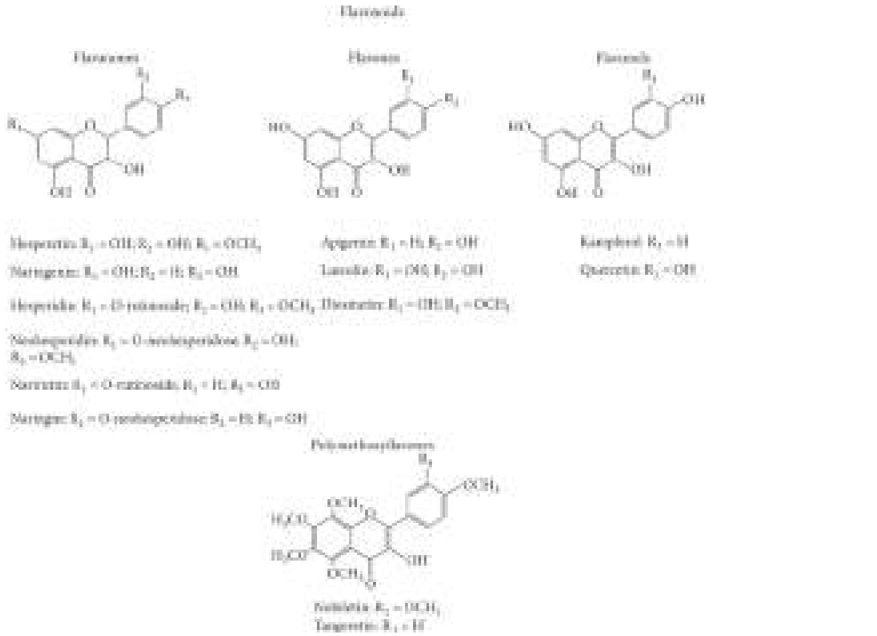
Fig. 1 *Citrus aurantium* with their bioactive compounds. (Source: Maksoud et al. [53] (CC BY 4.0 https://creativecommons.org/licenses/by/4.0/))

primary bioactive substances found in *C. aurantium* are flavonoids, which are further divided into flavanones, flavones, and flavonols. There are also alkaloids such as p-synephrine and other limonoids like limonin and nomilin [53]. Figure 1 depiction of *Citrus aurantium*'s juice, blossoms, seeds, leaves, and peels is followed by a detailed analysis of each part's bioactive chemical concentration. It is important to remember that the location, growing season, and harvesting time all significantly impact the chemical composition or quantity of biomolecules [53].

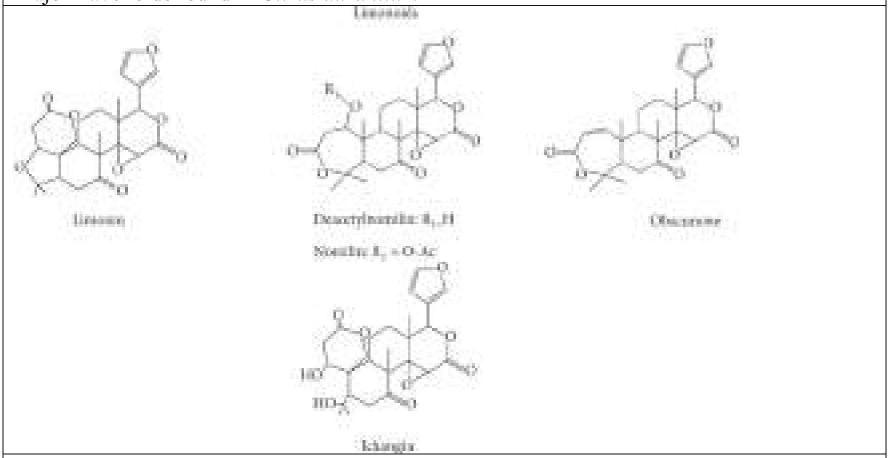
One of the several chemical components of *C. aurantium*, flavonoids from the phenolic family, have been recognized as significant due to their physiological and pharmacological relevance as well as their health benefits. Flavones, flavanones, flavonols, and anthocyanins are the derivatives of flavonoids commonly found in *C. aurantium* (Fig. 2) [3].

Flavanones are the main flavonoids present in *C. aurantium* and the two most common free flavanones found so far are hesperetin (4-methoxy-3,5,7-tri-hydroxyflavanone) and naringenin (4,5,7-trihydroxyflavanone) [3, 54]. The structural similarities between hesperetin and naringenin include the presence of aglycones or glycosides and two hydroxyl groups at positions C-5 and C-7, respectively [3, 55]. Hesperidin and neohesperdin, which are conjugates with rutinose and neohesperdose, respectively, are the two most common glycosides of hesperetin [3]. Naringenin (naringenin-7-neohesperidoside) and narirutin (naringenin-7-rutinoside) are the two most widely used naringenin glycosyl derivatives [3, 55].

The flavones in their aglycon or/and glycosidic form are the second most prevalent type of flavonoids found in *C. aurantium*. Apigenin, luteolin, and diosmetin are the three free flavones that are most frequently detected in *C. aurantium* [3]. O-glycosides and C-glycosides are the two primary forms of flavone glycosides [54].



Major flavonoids found in *Citrus aurantium*



Major limmonoids found in *Citrus aurantium*

Fig. 2 Structure of major chemical composition of *Citrus aurantium*. (Source: Suntar et al. [3] (CC BY 4.0 https://creativecommons.org/licenses/by/4.0/))

Examples of methoxylated flavones found in *C. aurantium* include nobiletin and tangeretin, meaning that all or almost all their hydroxyls have been capped by methylation [3]. *C. aurantium* may also contain very small quantities of flavonols like quercetin and kaempferol, especially in glycosidic form [3].

The second class of secondary metabolites identified in *C. aurantium* are limonoids (Fig. 2). They are oxygenated triterpenoids because of the exceptionally large quantities of oxygen atoms (7–11) present in their structures [3]. There are glucosidic (bitter taste) and aglyconic (water-insoluble but flavorless) types of limonoids. The most significant limonoid is limonin, which has been recognized as a citrus component [3].

P-synephrine is the chemical that is most common among the phenylethylamine alkaloids found in *C. aurantium* [3]. This substance has a hydroxyl group linked to the para position of the benzene ring and structural similarities with ephedrine [3] (Suntar et al. 2018). The peel of unripe fruits is the part of the plant that has the largest amount of p-synephrine [3].

The chemical constitution of *C. aurantium* is a complex one even though the peel is made up of unique and familiar essential oil. The essential oil of citrus fruit especially *C. aurantium* affords them the strong flavor and smell that have been linked to several medicinal activities. Apart from the essential oil found in the peel of *C. aurantium*, there are also synephrine, flavones, alkaloid, *N*-methyltyramine, and carotenoids, and octopamine. The principal bioactive components of *C. aurantium* are synephrine and *N*-methyltyramine with 0.24–1.45% (g/g) and 0.19–0.83% (g/g) respectively [35].

Other phytoconstituents of *C. aurantium* include neohesperidin, noradrenaline, tyramine quinoline, rhoifoli, 5-odesmethyl nobiletin, narcotin, tryptamine, lonicerin, nobiletin, and naringin.

The essential oil constituent of *C. aurantium* peels contains majorly limonene (about 90%) and then vitamin C, coumarins, triterpenes, pectin, carotene, and flavonoids. The flavonoids constituents are notable for their efficacy against fungi, inflammation, and bacterial infections. There is however variation in the essential oil constitution in the leaves, peel, and flowers of *C. aurantium*. For instance, the essential oil of *C. aurantium* leaves is dominated by linalyl acetate which is about 50% composition while linalool (constituting 35% of the essential oil) is the major makeup of the flowers.

Unripe fruits of *C. aurantium* contains cirantin (which is generally believed to be a contraceptive) including: acetic-acid, decylpelargonate, alphahumulene, gamma-elemene, decanal, alphapinene, alpha-terpineol, geranyl acetate, alpha-terpinyl-acetate, alphaylangene, 5-hydroxyauranetin, ascorbic-acid, isolimonic acid, palmitic acid, aurapten, isoscutellarein, beta-elemene, valencene, betaocimene, beta-pinene, cadinene, benzoic acid, decylaldehyde, geranic acid, caryophyllene, delta-cadinene, dodecen-2-al-(1), dipentene, 4-terpineol, hesperidin, caryophyllene, isotetramethylether, neryl acetate, caprinaldehyde, sabinene, llinalylacetate, nonanol, stachydrine, limonin, nootkatone, tannic acid, octyl acetate, terpinen-4-ol, naringenin, p-cymol, cryptoxanthin, furfurol, tetra-o-methyl-scutellarein, acetaldehyde, pectin, farnesol, linalyl acetate, transhexen-2-al-1, pentanol, umbelliferone, phenol, nerolidol, pyrrol, delta-3-carene, lauric aldehyde, citral, rhoifolin, naringin, aurantiamene, d-citronellic acid, alpha-phellandrene, hexanol, d-limonene, geraniol, citronellic acid, gamma-terpinene, isosinensetin, citronellol, (+)-auraptenal, dodecanal, alphapinene, butanol, dl-linalool, nomilin, methanol, cinnamic acid, l-stachydrine, sinensetin, nonylaldehyde, linalool, tangeretin, octanol, malic acid, terpenyl acetate, citronellal, nerol, pcymene, terpinolene, linalool, cis-ocimene, dlterpineol, thymol, pelargonic acid, cis-ocimene, geranyl oxide, trans-ocimene, phellandrene, carvone, nobiletin, undecanal, phenylacetic acid, duodecylaldehyde, mannose, violaxanthin, limonene, pyrrole, delta-3-carene, neral, d-nerolidol, l-linalool, camphene, gamma-terpinene, indole, formic acid, beta-copaene, alpha-ionone, ethanol [35] (Table 1).

As previously discussed, the phytochemical constituents of *C. aurantium* are majorly the glycosides, flavonoids, carbohydrates, alkaloids, tannins, saponins, terpenoids, steroids, and phenolic compounds [75]. Phytochemical analysis of the leaf extract of *C. aurantium* revealed tannins, phytosterols, terpenoids, proteins, saponins, flavonoids, essential oils, and carbohydrates [58]. Several authors have also reported their findings on the phytochemical constituents of various parts of *C. aurantium*. Variations in percentage of bioactive compounds and chemical composition in their reports have been linked to the period of harvest, type of solvent, extraction method, geographical area, or growing season. For instance, the phytochemical screening by Ishaq et al. [75] was in tandem with that of Rauf et al. [76] where phenols, flavonoids, steroids, and tannins were reported but contravenes the study by Gunwantrao et al. [77] where no terpenoids and flavonoids were reported in ethanol peel extract of *C. aurantium*.

In a recent study by Babajide et al. [78] whereby different solvents (n-hexane, ethanol, and aqueous) were used for extraction, the leaf extract of *C. aurantium* indicated the presence of terpenoid, flavonoid, saponin, tannin, and glycoside but for saponin that was not present in the n-hexane extract. This report was also in agreement with the result from the works of Khudhair et al. [79] where saponins, flavonoids, and tannins were reported in the aqueous leaf extract of *C. auratium* and that of Rao et al. [80] reported the absence of absence of phlobatannins and saponins but the confirmation of flavonoids, tannins, and terpenoids in the ethanol and aqueous extracts of *C. aurantium*. Also, confirmation of flavonoids in this study agrees with the report of He et al. [81] and that of Khudhair et al. [79] where the seeds and peel extracts of *C. auratium* revealed abundant cardiac glycosides, alkaloids, steroids, tannins, saponins, and flavonoids.

Because of the versatility of *C. aurantium,* the phytochemical constituents have been linked to its biological and physiological activities against different ailments. For instance, phenolic compounds in *C. aurantium* have been reported from several studies to have inhibitory potential [82]. In the same way, the flavonoid constituent of *C. aurantium* has been linked to antioxidant, antiproliferative, anti-inflammatory, antimicrobial, anti-diabetic, anticarcinogenic, cardio-protective, and anticholesterolemic activities in promoting the general well-being in humans [35, 83]. The main components in *C. aurantium* seeds have been reported to be flavonoid (56%) at maturity and phenolic acids constituent is 22% [68]. The efficacy of *C. aurantium* as an antioxidant agent is associated with their natural capacity in quenching free radicals and disrupting the radical chains [83].

The extraction of bioactive agents from *C. aurantium* is also very important. As previously said, various factors could be responsible for different chemical components and percentage of the active agents obtained. By and large, extraction of

Table 1 Bioactive compounds and extraction methods of *C. aurantium* plant

S/N	Plant part	Compounds	Extraction means	Class of compound	Solvent	Reference
1	Leaves	α-terpineol, limonene, linalyl acetate, and linalool,	–	Essential oil	–	[56, 57]
		O-cymene, eucalyptol, 4-terpineol, β-pinene, α-pinene, D-limonene, α-terpineol, sabinene, β-linalool, and β-myrcene	Hydro-distillation	Essential oil	–	[58]
		Total phenols, flavonoids, flavonols, proantho-cyanidins, polymerized phenols, hydrolyzable tannins, and soluble phenols	Solvent extraction	Phenolic compounds	Methanol: water (80: 20)	[59]
2	Peels	Sesquiterpenes, monoterpenes	–	Essential oil		[60, 61]
		n-nonadecanoic, abinene, cyclohexene, α-pinene, n-decanal, octyl aldehyde, myrcene, dimethoxybenzylidene, α-terpineol, δ-guaiene, limonene, n-octanol, β-fenchyl alcohol, hexasiloxane, β-pinene, γ-gurjunene, cyclotrisiloxane, octyl aldehyde, and thyocynic acid	Microwave steam distillation	Essential oil	Aqueous	[62]
		Synephrine, N-methylthyramine, octopamine, and carotenoids	–	Flavones and alkaloids	–	[60, 61]
		Geranyl acetate, β-pinene, limonene, linalyl acetate, myrcene, geranial, sabinene, linalool, β-caryophyllene, γ-terpinene, and neral	Peel rinds squeezing	Monoterpene hydrocarbons and oxygenated monoterpenes	n-hexane	
		p-coumaric and ferulic acids	Hydro-distillation	Phenolic compounds	Diethyl ether	[31]

		Galacturonic acid	Microwave-assisted extraction	Pectin	Citric acid aqueous solution	[63, 64]
		Limonene, α-terpinene, octanal, camphor, α-terpinyl acetate, and 1, 8-cineole	Hydro-distillation	–	–	[65]
3	Seeds	Hesperidin, naringin, neohesperidin, and narirutin	Soxhlet extraction	Flavonoids	Acetone and petroleum ether	[66, 67]
		Hesperidin, rutin, naringin, naphtorecinol, quercetin, resorcinol, epigallocatechin, kaempherol, apigenin, neohesperidin, and catechin	Solvent extraction	Flavonoids	Methanol	[68]
		p-coumaric acid, syringic acid, rosmarinic acid, vanillic acid, gallic acid, and trans-2-hydroxycinnamic acid	Solvent extraction	Phenolic acids	Methanol	[68]
		Vanillic acid – Hydroxybenzoic acids; and caffeic acid, *p*-coumaric acid, trans-ferulic acid - Hydroxycinnamic acids	Solvent extraction	Phenolic acid	Methanol	[69]
		Free stigmasterol, esterified β-sitosterol, free β-sitosterol, and campesterol	Soxhlet extraction	Phytosterols	n-hexane	[66]
		Arachidic acid, stearic acid, linoleic acid, cerotic acid, oleic acid, and palmitic acid, and palmitoleic acid	Soxhlet extraction	Fatty acid	n-hexane	[66]
4	Flowers	Rutin, pyrogallol, caffeic acid, gallic acid, quercetin, syringic acid, and naringin	Solvent extraction	Phenolic and flavonoids	Ethanol, methanol, and aqueous	[70]

Table 1 (continued)

S/N	Plant part	Compounds	Extraction means	Class of compound	Solvent	Reference
		Hotrienol, linalool, nerol, and terpineol	Soxhlet extraction	Oxygenated monoterpenes	Ethanol	[71]
		Tetrapentacontane and dotriacontan	Soxhlet extraction	Aliphatic hydrocarbons	Ethanol	[71]
		β-pinene, β-myrcene limonene, and β-ocimene	Soxhlet extraction	Monoterpene hydrocarbons	Ethanol	[71]
		Neryl acetate and linalyl acetate	Soxhlet extraction	Esters	Ethanol	[71]
		Hexadecanoic acid, linalool, D-glucuronic acid, daphnetin, octadecenoic acid, D-limonene, phthalic acid, and pyrrolidinone	Solvent extraction	–	80% ethanol	[72]
		Farnesol, linalool, geranyl acetate, linalool acetate, and nerolidol	Microwave-assisted hydro-distillation, Microwave-assisted hydro-distillation solvent microwave extraction and solvent-free microwave extraction	–	Aqueous	[73]
5	Fruit	Synephrine, neohesperidin, and naringin	Ultrasound-assisted aqueous two-phase extraction	Flavonoid	Ethanol	[74]
6	Juice	Limonene, α-thujene, and α-phellandrene	Solvent extraction	Monoterpene hydrocarbons	Ether-pentane (1:1)	[31]
		Caryophyllene oxide	Solvent extraction	Oxygenated sesquiterpenes	Ether-pentane (1:1)	[31]
		Ferulic acids and *p*-coumaric	Solvent extraction	Phenolic acids	Ether-pentane (1:1)	[31]
		Quercetin and rutin	Solvent extraction	Flavonoid	Ether-pentane (1:1)	[31]

bioactive compounds from different parts of *C. aurantium* or their wastes has also been of benefits to the agro-industrial activity while the metabolites serve beneficial roles in various sectors like pharmaceutical, food, cosmetic, beverage, and other industries [53]. Since no single extraction method is regarded as the principal reference point for extraction of active compounds, the following are the established and unconventional extraction means on *C. aurantium* plant parts: Soxhlet extraction, microwave-assisted extraction, supercritical fluid extraction, solvent extraction, hydro-distillation, and ultrasound-assisted extraction [53].

Specifically, bioactive molecules in *C. aurantium* parts like leaves, juice, flowers, seeds, and peels are presented in Table 1.

4 Scientific Evidence-Based Therapeutic Potentials of *Citrus aurantium*

C. aurantium like other species of the citrus family has been attributed to have therapeutic properties in deterring several life-threatening diseases [84] which in recent times has been in high demand due to the shift in the use of natural products for therapeutic purposes as opposed to conventional orthodox medicines. From the early days of human civilization, citrus fruits have been used not only as food but also as medicine, according to Gao et al. [1], there are documented use of Citrus in ancient traditional Chinese medicine hence the need to extensively study and utilize its potential in modern medicine, its use has been reported in Japan and Korea [53] and in Africa [85]. Several species in the Citrus genus like *C. aurantifolia, C. limon, C. reticulata,* and *C. paradisi* are favored for use as medicinal constituents are of their chemical constituents, pleasant aromas, and availability. *C. aurantium* unlike other species of Citrus has just been recognized for its therapeutic properties, the chemical constituents of *C. aurantium* are known to have several benefits to human health, and more benefits have been discovered in recent times.

The ethnomedical uses of *C. aurantium* and CACH are of interest to the scientific community. It promotes the regular, in-depth exploration of the various pharmacological routes that control CACH. Currently known extracts and isolated compounds exhibit a range of pharmacological actions, including anti-inflammatory, antioxidant, anticancer, hypolipidemic, and organ protection. The distinct pharmacological action is explained in this section and then summarized in the following list (Fig. 3).

4.1 Antibacterial Activity

Extracts and essential oils from citrus fruits are known to be natural antimicrobials particularly bacteria used in the food industry as well as in cosmetic industry [86]. Several authors have reported the antibacterial properties of *C. aurantium* extracts against certain species of bacteria which are mostly biostatic for the first 2 days and then biocidal after 7–8 days. Aladekoyi et al. [86] reported a 0.25 mm maximum zone of inhibition against *Pseudomonas aeruginosa* but showed no zone of inhibition against

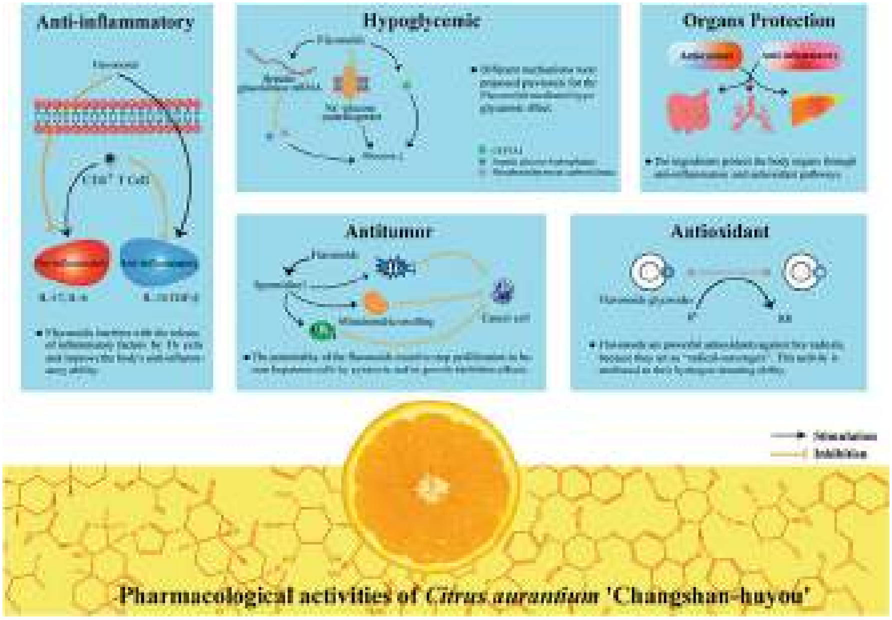

Fig. 3 Distinct therapeutic potentials of *Citrus aurantium* and CACH. (Source: Gao et al. [1] (CC BY 4.0 https://creativecommons.org/licenses/by/4.0/))

Escherichia coli and *Klebsiella* from an antimicrobial susceptibility assay done using oil extracted from the seeds of *C. aurantium*. Essential oils extracted from *C. aurantium* showed a high inhibition zone from 8 to 18 mm when used as an antibiofilm inhibitor against *Bacillus subtilis* and *Stenotrophomonas maltaphilia* [87]. In a study done by Benzaid et al. [88], it was observed that essential oil from the flowers of *C. aurantium* showed a reduction in the growth of *Streptococcus mutans* and the expression of its virulent genes. According to Okla et al. [89], when essential oils from the bark, leaves, and branches of *C. aurantium* were tested against *Erwinia amylovora, Dikeya solani,* and *Agrobacterium tumefaciens*, the notable diameters of inhibition zone came with the increase in the measure of the oil used from the initial 10–25 μl. Karabiyikli et al. [90] studied the effect of *C. aurantium* juice on *Listeria monocytogenes* and *Salmonella typhimurium* and it showed these microbes were able to survive for 2 days in pH neutralized juice and after a seven-day incubation period no growth was found suggesting that the low pH, length of incubation and temperature are enabling factors for the antimicrobial property of *C. aurantium*. Gopal [91] reported significant inhibition zones against Gram-positive *Bacillus subtilis* and *Staphylococcus* and Gram-negative *Klebsiella pneumonia* and *Escherichia coli* using extracts from *C. aurantium* leaves. A study done in Algeria by Haraoui et al. [92] on the antibacterial profile of Citrus plants showed that *C. aurantium* showed a higher antimicrobial activity comparable to *C. limon*; from their observations *C. aurantium* contains certain phytochemicals and the sensitivity and the tolerance level of some bacteria made them more prone to being denatured by these chemicals.

Organisms tested against *C. aurantium* juice that showed high antibacterial activity in their study include Gram positive: *Staphylococcus aureus, Bacillus subtilis, Staphylococcus epidermidis, Micrococcus luteus*, and *Enterococcus faecalis* and Gram negative: *Klebsiella, Pseudomonas aeruginosa,* and *Escherichia coli.* According to Teneva et al. [93] from their study on the antimicrobial activity of essential oils, the antimicrobial activity of the oils is based on their chemical composition; bioactive alcohols like linalool and carveol enhance the antimicrobial activities. From their investigations, Gram-negative bacteria were more resistant to the essential oils because of their outer cell membrane which obstructs the dispersion of the oils to the cytoplasm of the cell through the cell membrane showing zones of inhibition of 9–10 mm while the Gram-positive bacteria were more sensitive to the essential oils with a measured zone of inhibition of 12.5 mm.

4.2 Antifungal Properties

Citrus oils have been harnessed for use in dermatological formulations for topical applications on the skin and scalp to prevent and cure diseases due to their perceived antifungal properties. Several research have shown the efficacy of *C. aurantifolia* but not much has been done for *C. aurantium* over time; citrus oil was studied by Clavaud et al. [94] against the fungal species Malassezia furfur in vitro, it was observed that the oil had a biostatic effect on the organism with zone of exhibition of 2.6 mm, since most *Citrus* spp. has similar phytochemicals though in varying proportions it is assumed that the oil from *C. aurantium* may also have antifungal properties. Kačániová et al. [87] however reported using *C. aurantium* oil in an antibiofilm study resulting in high zones of inhibition against *Penicilium crustosum, P. expansum,* and *P. citrinum.* Ellouze et al. [95] observed a moderate effect of *C. aurantium* leaves essential oil on *Saccharomyces cerevisiae* and *Mucor ramannianus* with the 9.2 and 5 mg/ml minimum inhibition concentration respectively when compared to its antibacterial properties.

4.3 Antioxidant Properties

Antioxidants are stable molecules that donate electrons to free radicals and neutralize them and reducing their capacity to damage cells in the body [96]. According to Maksoud et al. [53], *C. aurantium* is a great source of antioxidants, it has a high level of flavonoid among other phytochemicals [1] whose hydrogen donating ability makes it a strong antioxidant against free radicals. The antioxidant properties of *C. aurantium* may vary according to the plant part used and the antioxidant levels may be dependent on the extraction method. From research by Shi et al. [97], they observed that the dry and immature fruits of *C. aurantium* contain a high flavonoid content of 76.22% and 4 types of flavonoids were observed namely: hesperidin, naringin, narirutin, and neohesperidin. Bendaha et al. [98] worked on the antioxidant activity of essential oil from the peels of *C. aurantium* fruit grown in Eastern

Morocco using 2,2-Diphenyl-1-picrylhydrazyl (DPPH) assay and observed that the essential oil did not show any substantial antioxidant activities as the DPPH capacity ranged from 7–15% displaying a weak DPPH scavenging capability. The essential oil was found to consist of myrcene and more than 90% limonene; myrcene and limonene are not considered to play a major in determining the scavenging activity. Teneva et al. [93] studied the antioxidant activity of *C. aurantium* peel oils using DPPH assay and results show that limonene, β-myrcene, and α-pinene were the main components resulting in 85.22%, 4.3%, and 1.29% respectively. When compared to other antioxidants *C. aurantium* L essential oil showed a higher antioxidant activity at 88.1% in the DPPH assay and this can be explained by the different composition of *C. aurantium* species.

4.4 Anticancer/Cytotoxic Activity

Treatment for cancers through conventional medications can be effective but with many side effects which may lead to damage to other body cells as well as the targeted cancer cells. To this end, new research aimed at using diet for cancer treatment has been on the rise in recent times; by regulating the metabolic niche of the cancer cells and using antitumor (specific active food molecules) that can target the metabolic pathways of the cancer cells [1]. This is aimed at disrupting the increase and spread of the cancer cells after identifying the pathogenesis of the tumor cells. Bian et al. [99] have reported the use of the Chinese herbal drug Weifuchen tablet which contains *Fructus aurantii*; the dried unripe fruits of *C. aurantium* in combination with Red Gingeng (Renshen) and Isoden amethystoides for relief from precancerous lesions in people with gastric cancer through the regulation of intestinal microbial balance. This implies that *C. aurantium* is a good herbal alternative for cancer treatment.

Yao et al. [100] experimented on the use of the active ingredients contained in *C. aurantium* in the treatment of lung cancer, the study which was validated by both molecular and cellular experiments proved that nobiletin in *C. aurantium* inhibits the development of non-small cell lung cancer (NSCLC) as a key ingredient through targets and other related pathways. Though further clinical studies are needed, it was established that nobiletin inhibited the growth of NSCLC and the expression of certain cancer cells was affected.

According to Gao et al. [1], neohesperidin a type of flavonoid has a negative growth impact on human hepatoma cells and *Citrus aurantium* “Changshan-huyou” (CACH) also has anti-tumor activity by intervening with the cell cycle of the cancer cells and impeding their growth.

Shen et al. [101] evaluated the extracts of crude polysaccharides of *C. aurantium* L. var. Amara Engls (CAVAPs) and showed that they enhance the immune system. When RAW264.7 cells were exposed to CAVAPs, the CAVAPS stimulated the production of tumor necrosis factor-α (TNF-α) and interleukin-1β. Further evaluation showed that CAVAPs may possibly activate macrophage signaling pathways through mitogen-activated protein kinase (MAPK) and nuclear factor kappa B (NF-kB).

Research carried out by Han et al. [102] on the apoptotic activities of the peels of *C. aurantium* (CME) on U937 human leukemia cells showed that CME inhibited the growth of U937 cells. CME-induced apoptosis was dose-dependent and triggered by curbing Bcl-2 and IAPs related to the activation of Akt through an intrinsic pathway. Akt is an upstream signal that controls Bcl-2 and IAPs and regulates cell multiplication and programmed death and the study confirmed that CME suppressed Akt phosphorylation, and this is associated with apoptosis.

4.5 Effects on Cardiovascular Activity

Most research on *C. aurantium* are said to be beneficial but some research have looked at the possible toxicity of it. Like other Citrus species, *C. aurantium* contains the alkaloid p-synephrine; known for its anti-obesity properties and treatment of digestive problems because of its fat-decreasing properties in traditional medicines, however according to Arbo et al. [103] it has been flagged as a toxic alkaloid potential risk to the human cardiovascular system by the National Collegiate Athletic Association (NCAA) hence the need for in-depth research. Arbo et al. [103] observed that *C. aurantium* extracts and p-synephrine showed no significant effect on the cardiovascular systems of mice and suggested that the toxicity may arise from the combination of p-synephrine with other stimulants such as caffeine, salicin, and amphetamines. This is in tandem with the observations of other authors including [104] who reported that the association of high doses of p-synephrine together with caffeine and ephedrine caused death due to cardiac complications such as hypertension, strokes, arrhythmias, and heart attack. Hansen et al. [45] also observed that the use of p-synephrine either in its pure state or in *C. aurantium* extract on test animals showed no significant increase in blood pressure and heart rate even at doses much higher than that used in humans. Test animals treated with 95% p-synephrine showed lower increases in blood pressure and heart rate when compared with animals treated with *C. aurantium* extract which suggests that other components of the extracts can be attributed for these changes, there were also significant increases in the cardiovascular parameters when caffeine given together with p-synephrine implicating the addition of the caffeine for the increased heart rate and blood pressure. The reports of the negative effects of p-synephrine have not been confirmed in other studies.

Stohs [105] and Penzak [106] in their independent studies both observed that on its own p-synephrine has low toxicity but when in combination with other components like caffeine, salicin and ephedrine in products can induce cardiovascular effects. Kang et al. [107] (2016) studied the effects of neroli oil on the cardiovascular system as a vasodilator in mice (neroli oil extracted from the flowers of *C. aurantium* var. amara which is rich in limonene and linalool is used to manage anxiety and stress and also to treat high blood pressure and other cardiovascular symptoms) was studied due to the claims that it causes hypotension and bradycardia in adolescents and observed that in the aorta rings of the mice that are already precontracted with prostaglandin f2α, vasodilation was induced, but for rings precontracted with nitric oxide synthase inhibitor the relaxation effects decreased. This induced muscle relaxation was partially reversed by 1H-[1, 2, 4] oxadiazolo [4,3-a] quinoxalin-1-1, a soluble guanylyl cyclase inhibitor. Also, neroli oil suppressed the effect of extracellular Ca^{2+}-dependent contraction in a dose-dependent manner. Ultimately the research indicated that the relaxation effects of neroli affect both the vascular smooth muscle and the vascular endothelium, but no negative effect was observed.

4.6 Anti-obesity Activity

C. aurantium is considered a sport enhancer and swift weight loss ingredient and as an alternative therapeutic dietary supplement as it contains compounds such as flavonoids and polyphenols both of which can reduce the accumulation of lipids [108]. Stohs et al. [109] in their review of human clinical trials involving the use of *C. aurantium* and its alkaloid p-synephrine observed that from over 20 studies carried out with over 50% of the 360 test subjects were obese. P-synephrine was given in combination with caffeine, guarana, green tea, gingko, ginseng, and yerba mate making it difficult to ascertain if weight loss was as a result of p-synephrine or the other components; be that as it may, it was deduced that *C. aurantium* is the most likely causative agent for weight loss because of its effects on metabolic processes including increase in metabolic rate, appetite suppression, and lipolysis. More so 50% of the subjects were caffeine consumers before the commencement of the studies but were still obese. *C. aurantium* was found to show increase in the metabolic rate and energy expenditure of the subjects and when consumed for up to 12 weeks may result in eventual weight loss, hence it can be consumed as dietary supplement at defined doses.

According to research by Li et al. [110], blossoms of *C. aurantium L* var. amara Engl have been reported to inhibit lipid deposits, to better understand the constituents from the blossom extracts responsible for the bioactivity and the mechanism for the lipid breakdown were studied. Using chloroform to harvest the extracts, 14 compounds were identified and nobiletin, trigonelline hydrochloride, and 7-demethysuberosin were more. The chloroform extracts significantly decreased lipid accumulation and improved the plasma biochemical profile in high-fat diet-fed mice by enhancing the gut microbiota. At higher doses, the chloroform extracts increased the abundance of Lachnospiraceae while at lower doses increased the abundance of Erysipelotrichaceae and reduced the ratio of Firmicutes to Bacteroidetes.

Park et al. [108] investigated the anti-obesity mechanism of *C. aurantium* by administering it in high-fat diet-induced obese mice for 8 weeks. Eighty percent ethanol extracts of immature dried *C. aurantium* fruits were analyzed and found to contain naringin 20.1% and neohesperidin 14.4% and other phytochemicals in lesser quantities. The effect of *C. aurantium* on promoting adipogenesis and thermogenesis is dependent on activated protein kinase alpha (AMPKα) activation (the energy sensor and regulator of metabolic homeostasis). From their observations, there were elevated phosphorylation levels of AMPKα and ACC in the 3T3-L1 adipocytes and culture brown adipocytes due to the *C. aurantium*. The anti-obese effects of *C. aurantium* were dependent on the activation of the AMPKα pathway due to the elimination of the anti-adipogenic and pro-thermogenic effects of the *C. aurantium* impeding the AMPKα pathway through the introduction of cell culture pre-treatment. The result was a significant decrease of body weight, serum cholesterol, and adipose tissue weight in the mice suggesting that *C. aurantium* has the potential of being used as an anti-obese agent as it inhibits white adipogenesis and induces brown adipocyte thermogenesis through AMPKα activation.

Verpeut et al. [111] worked on the anti-obesity effects of *C. aurantium* (6% synephrine) and *Rhodiola rosea* L. (3% rosavins and 1% salidroside) in combination on diet-induced obese rats. From their investigations, *C. aurantium* or *R. rosea* alone did not suppress appetite in normal weight rats, but *C. auratium* and *R. rosea* in combination when administered registered a 10.5% appetite suppression by elevating the hypothalamic norepinephrine and the frontal cortex dopamine. It can however be deduced that the combination of *C. aurantium* and *R. rosea* are effective in altering appetite suppression and obesity because of the interaction between the two extracts and their bioactive components.

4.7 Hypoglycemic Activity

According to Gao et al. [1], the use of *C. aurantium* in treating and preventing diabetes and hyperlipidemia is receiving widespread because its mechanism has not been fully understood yet. The assumption is that the hypoglycemic effects of *C. aurantium* are achieved by improving lipid metabolism, regulation of the intestinal flora, and the increased consumption of glucose. Jia et al. [112] researched on the use of neohesperidin isolated from *C. aurantium* in in vivo treatment of hypoglycemia and hypolipidemia in KK-ay diabetic mice. The results showed a significant reduction in fasting glucose, serum glucose, total cholesterol, triglycerides, leptin level, and glycosylated serum protein in the treatment mice when compared to the control at the end of the experiment. At the end of the six-week period Neohesperidin treatment showed a high potential as a hypoglycemic agent in vivo.

From the investigations of Zhang et al. [113], naringin and neohesperidin isolated from *C. aurantium* var. *changshanensis* showed significant effects on glucose consumption by Hep G2 cells through the process of increased phosphorylation of AMPK expression in the cells. Neohesperidin and naringin showed enhancement of glucose consumption in a manner like metformin. Campbell et al. [114] investigated the lipid-lowering effects of an infusion of *Rawolfia vomitoria* leaves and *C. aurantium* fruits, a Nigerian anti-diabetic infusion consumed locally and attributed to decrease blood glucose level when consumed with the patient expected to stick to a low carbohydrate and fat diet with strict no alcohol consumption. The study was conducted on 6–11-week-old lean mice including inbred and outbred mice. There was no significance in their appearance but there was a transitory effect on the motor activity of the mice on the first day of administration. After 6 weeks, there was an observed significant weight loss when the dosage corresponding to ten-fold human daily dosage was administered to genetic diabetic mice which had been maintained on a carbohydrate-deficient diet. The control group did not have a significantly different diet from the treatment group; however, the treatment group had a significantly higher serum triglyceride level proposing that the lipid might be from internal stores. The treatment mice also showed a reduced stearoyl CoA desaturase activity.

4.8 Anti-inflammatory Activity

C. aurantium like other citrus fruits is highly rich in flavonoids and other bioactive natural products. Examples of citrus flavonoids include narirutin, neohesperidine, and naringin and they display strong biological activities like anti-inflammation and are likely therapeutic choices for treatment of metabolic dysregulation [115]. Wang et al. [116], from their research on the fruits of *C. paradisi*; a hybrid of *C. aurantium* as an anti-inflammatory for the inhibition of asthma allergens observed that the dry immature of *C. aurantium* contains narirutin, neohesperidin, and naringin which are the primary active components, and they exhibit powerful inflammatory activities and inhibit airway remodeling in asthma allergens by regulating the Smad2/3 and MAPKs signaling pathways. The overexpression of inflammatory factors is related to the symptoms of diseases like chronic gastritis and peptic ulcer and *C. aurantium* can be used in treating them [1].

Jiang et al. [115] worked on the anti-inflammatory effects of total flavonoids extracted from *C. aurantium* hybrid QZK (TFCH) on non-alcoholic fatty liver disease in vivo and it was observed that TFCH suppresses both systemic and intrahepatic inflammation and attenuates hepatic lesions in obesity-induced rats. The effects were marked by the suppression of NF-Kb and MAPKs. From this result, it can be deduced that the extracted flavonoid component in TFCH is the main activator of anti-non-alcoholic fatty liver disease property of the extract and is a new source for the development of therapeutic medicine for the treatment of anti-non-alcoholic fatty liver disease.

Pallavi et al. [84], from their investigations on the anti-inflammatory and anti-nociceptive properties of the peels of Citrus fruits common in India, observed that all citrus fruits contain naturally high levels of phytochemicals like flavonoids, steroids, terpenoids, glycosides, carotenoids, phenolic compounds, and alkaloids; and showed that *C. medica* fruit peel extract exhibited significant anti-inflammatory and analgesic property in a dose-dependent manner which is similar to the standard indomethacin drug, this was followed by *C. reticulate*, *C. aurantium*, *C. aurantifolia,* and lastly *C. grandis* and generally the anti-inflammatory property was more evident in the later phases of time interval.

CACH can be used to treat both chronic gastritis and peptic ulcers, which are predominantly brought on by the overexpression of inflammatory factors. Jiang et al. [115] on the in vivo anti-inflammatory properties of TFCH showed that TFCH at doses of 50 to 100 mg kg^{-1} significantly lowered TNF-α, IL-6, IL-1, and other inflammatory

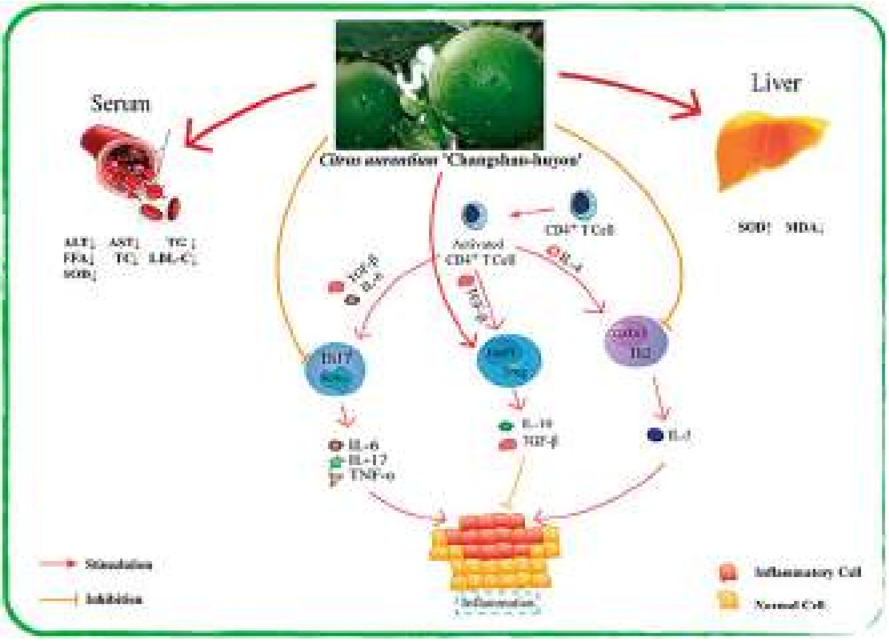

Fig. 4 Anti-inflammatory mechanism of CACH. (Source: Gao et al. [1] (CC BY 4.0 https://creativecommons.org/licenses/by/4.0/))

factors. According to the study, NF-B/MAPK is the main mechanism via which TFCH manifests its anti-inflammatory characteristics [1]. Figure 4 illustrates the most recent research on the anti-inflammatory mechanism of CACH based on the findings [1].

4.9 Hepato-Protective Activity

Jiang et al. [115] stated the protective properties of flavonoids found in *C. aurantium* extracts using the disease model of non-alcohol fatty liver disease (NAFLD) as discussed earlier. According to Yu et al. [117] the pathological features of NAFLD are simple fatty liver, hepatic sclerosis, and steatohepatitis and in some cases liver cancer, the microenvironment of the liver has been implicated for the development and rapid deterioration of NAFLD when it is inflamed and the oxidative stress. To prevent and treat liver diseases using *C. aurantium* is achieved through antioxidant, anti-inflammatory, and regulation of the intestinal microflora. Shi et al. [97] examined and evaluated the effects of TFCH on non-alcoholic steatohepatitis (NASH), a liver disorder involving hepatocellular injury over the course of NAFLD, using dried immature fruits of the *C. aurantium* cultivar known as TFCH. Using the antioxidant response element route of nuclear factor erythroid 2-related factor 2 (Nrf2), the NASH model was assessed in vivo and in vitro for 26 weeks and 8 weeks, respectively. The CCK-8 experiment demonstrated the anti-apoptotic effects of TFCH on

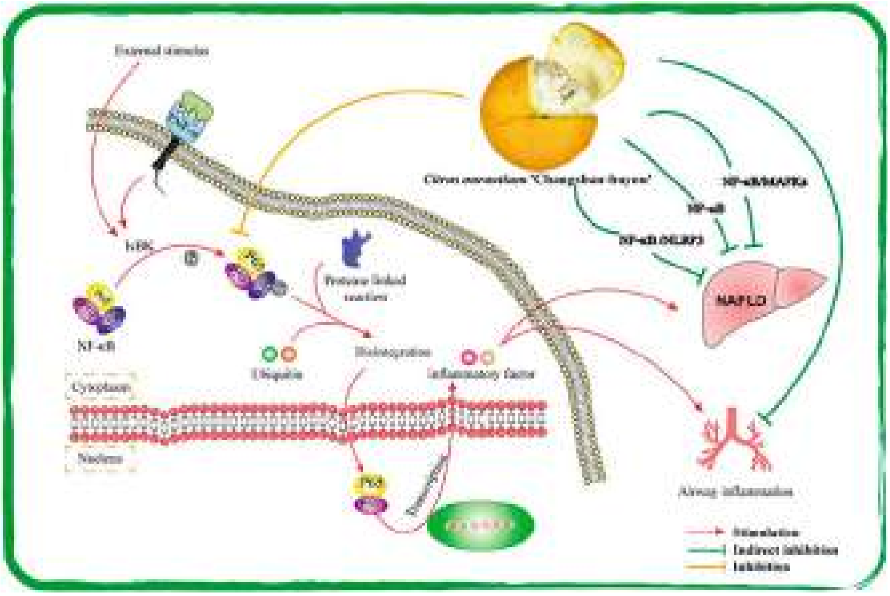

Fig. 5 Mechanism of CACH protection on organs through NF-κB pathway. (Source: Gao et al. [1] (CC BY 4.0 https://creativecommons.org/licenses/by/4.0/))

LX-2 cells grown with FFA. In vivo and in vitro measurements of lipid parameters and oxidative stress markers revealed that TFCH lowers oxidative damage in the NASH model and has a dose-dependent effect on antioxidant capacity. Analysis of Nrf2 and target gene protein expression in mouse liver and human LX-2 cells revealed that TFCH up-regulates these genes' protein expression and significantly alters the Nrf2-ARE signaling pathway. This suggests that TFCH has hepatoprotective and anti-oxidative effects on NASH and that TFCH therapy may eventually offer a unique therapeutic alternative for the treatment of NASH.

For instance, extensive research has been done on NF-B, a crucial protein in the pathways regulating liver inflammation in NAFLD. Jiang et al. [115] (2019) used male SD rats to develop an HFD-induced NAFLD model and isolated and produced TFCH. By limiting the phosphorylation of IB to stop the breakdown of NF-B and so preventing the creation and release of inflammatory components, TFCH reduces the inflammatory milieu in the liver. The results were also corroborated by the research's most successful drug group (polyene phosphatidylcholine capsule group, 196.3 mg/kg) (Fig. 5) [1].

4.10 Intestinal Adjustment

Drug usage should be regulated through treatments in the intestinal milieu since unfavorable drug reactions frequently occur in the intestines [1]. According to Chen et al. [118], consideration must be given to NSAID side effects that cause small intestine injury to take NSAIDs safely. Pure total flavonoids (PTFC) from the *C. aurantium* var. have been used as a form of treatment for digestive disorders, while the benefits and mechanisms of action are yet unknown. To show the protective advantages of PTFC, the study investigated the potential role of autophagy in the process of diclofenac and MSAIDs caused small intestinal injury. In rats with NSAID-induced small intestinal injury and IEC-6 cells treated with diclofenac, the expression levels of the tight junction (TJ) proteins ZO-1, claudin-1, and occludin light chain 3 (LC3)-II, as well as autophagy-related 5 (Atg5), were shown to be lower than in the control group. In the intestinal disease-induced rat group, p-PI3K and p-Akt expression levels increased in comparison to the control group but decreased in the PTFC group. Pretreatment with PTFC preserved the intestinal mucosal barriers and decreased NSAID-induced small intestine damage by increasing autophagy via the PI3K/Akt signaling pathway.

He et al. [119] analyzed the gut microbiota composition in NAFLD mice by pure total flavonoids from citrus (PTFC) treated high-fat diet using PTFC and the outcome of this was that PTFC adjusted the gut microbial structure, the abundance of the intestinal flora and improved the proliferation of Bacteriodeae, Akkermansia, and Christensenellaceae indicating that the advancement of NAFLD is linked to the gut microbiota and PTFC can modulate this target to therapeutic role.

4.11 The Role of *Citrus aurantium* in Skin Treatment

Linalool, linalyl acetate, and terpineol have been shown to have anti-aging properties when present in isolated form [120]. The antioxidant properties of many skin care products are linked to their anti-aging benefits, and these ingredients have been shown to have alluring antioxidant properties. Additionally, exposure to sunshine makes aging-related enzymes like collagenase and elastase work harder. These enzymes particularly degrade the collagen and elastin in the skin, resulting in wrinkles and skin sagging that are associated with getting older [121, 122]. However, *Citrus aurantium* essential oils have been demonstrated to have anti-aging properties since they inhibit the activity of the enzymes collagenase and elastase and are rich in linalool, linalyl acetate, and terpineol [16].

5 Safety Considerations from the Use of *Citrus aurantium* and Its Products

5.1 *Citrus aurantium* and Cardiovascular Toxicity

As asserted earlier, *Citrus aurantium* came to the limelight following the drawback encountered with the use of *Ephedra sinica* as a weight loss and athletic performance supplement, and its subsequent ban by the Food and Drug Administration (FDA) in April 2004 [123–127]. The suggestion of *Citrus aurantium* as a replacement for

Ephedra sinica is due to the structural similarities its main phytochemical, p-synephrine, shares with the Ephedra isolate, ephedrine. Ephedrine was observed to be associated with myocardial infarction, hypertension, and stroke [124, 128]. p-synephrine is a protoalkaloid extracted from the immature fruit or peel of *Citrus aurantium* with widespread use as a weight loss and athletic performance supplement [18]. It is an isomer of synephrine with a hydroxyl group in the para position, while other isomers have a hydroxyl group in the meta and ortho positions even though it is widely accepted that p-synephrine is safer than ephedrine, its toxicity index and range of safety have been controversial [126, 129].

5.2 The Controversies

In 2008, a reported case of a young man who presented with a myocardial infarction after the use of a synephrine-containing substance raised a huge medical concern [19]. The authors of the report hypothesized that myocardial infarction might have been due to coronary spasm followed by thrombosis which developed due to synephrine tablets abuse [19]. Aside the toxicity adduced to synephrine, the authors called the attention of readers to another study that asserted that *Citrus aurantium* contains a number of flavonoids, including 6′,7′-dihydroxybergamottin and furocoumarin, which selectively block the intestinal cytochrome P450 enzyme, CYP3A4, in bioavailability study [124, 130]. Consequently, increasing the serum level of the drugs metabolized by CYP3A4, and resulting in undesirable pharmacological interactions [124]. Indeed, several articles have further discussed the cardiovascular toxicity of *Citrus aurantium* and its product [106, 130–144]. More intriguingly, in 2010, *Citrus aurantium* was listed in the Customer's report as being possibly unsafe and a dietary supplement “to avoid” [145]. However, in many cases of reported adverse effects, the individuals were either exercising or had recently exercised [126, 135, 139, 142]. On the other hand, Stohs et al. [18] dissented from many toxicity reports for a variety of reasons, such as the use of complex mixtures of ingredients in products containing bitter orange extract, the disseminating of false information by governmental organizations, the misunderstandings surrounding the isomeric forms of synephrine and their various pharmacological properties, and the misrepresentations of p-synephrine, particularly its mistaken identity with other substances.

5.3 The Hansen et al. and Dr. Stohs' Debate on *Citrus aurantium* Safety: A Major Controversy

In view of the avalanche of articles attributing major hazardous potentials to *Citrus aurantium* and its product, Hansen et al. [17] intended to investigate the cardiovascular toxicity potentials of *Citrus aurantium* in exercised rats. Sprague-Dawley rats were administered a daily dose of 10 or 50 mg of synephrine/kg body weight (in both extract and pure form) for a total of 28 days, either alone or in combination with

25 mg/kg body weight of caffeine. Additionally, the rats were made to run for 30 min a day, 3 days a week, on a treadmill. Additionally, a group of rats was made to run on a treadmill for the same period while receiving a caffeine dose of 25 mg/kg body weight [17]. The body temperatures were carefully monitored, QT intervals, blood pressures, and heart rates of the rats. It was demonstrated that both dosages of synephrine considerably increased systolic and diastolic blood pressure for up to 8 h following treatment, even though the effects of caffeine seemed to have the largest impact on heart rate and body temperature. The scientists concluded that exercise, coffee, and synephrine all significantly affect blood pressure and heart rate. However, in a Letter to the Editor of the Journal of Cardiovascular Toxicology, Stohs [22] questioned the procedures and outcomes of the trial carried out by Hansen et al. [17]. The authors, according to Stohs [22], did not sufficiently discuss the clinical importance and relevance of *Citrus aurantium* and p-synephrine for humans, did not review the most recent scientific research on these two substances, and did not accurately relate their doses in rats to typically used doses in humans. Regarding the dose, Stohs [22] argued that the 50 mg/kg body weight of synephrine administered to the rats – equivalent to 8.1 mg/kg body weight in a man and roughly 649 mg for a typical 80 kg person – was simply too high for an adverse effect to go undetected [17, 22]. Stohs [22] noted that the authors' dose was 16 times the typical human dose as a result. Even yet, Stohs [22] noted that the trial's increases in systolic and diastolic blood pressure, which were 9.7% and 9.0%, respectively, were insufficient to cause concern. Hansen et al. [17] argued in defense of their methodology by saying that they used 10 mg/kg body weight of synephrine rather than 50 mg/kg body weight. According to the authors, the maximum dose of synephrine that can be given to a person is 1.62 mg/kg body weight. The authors reported that at this dose, systolic and diastolic blood pressure in the rats increased statistically significantly and remained for up to 8 h, indicating a pathogenic situation. Furthermore, Stohs [22] identified certain works that appear to defend synephrine, although Hansen et al. [17] claimed that they were not aware of such. *Citrus aurantium* caused some degree of cardiovascular damage in strenuous-exercising rats, according to the scientists' findings [17].

5.4 Other Toxicity Considerations

In an experiment by Deshmukh et al. [21] to assess the acute and 14-day oral toxicity of *Citrus aurantium* in rats, the LD50 of the plant extract standardized to 50% p-synephrine exceeded 5000 mg/kg body weight in female rats. Additionally, it was reported that no toxicity occurred when the plant extract was given orally to female rats for 4 days straight at a dose of 2000 mg/kg body weight [21]. A 14-day repeated dose of 50% p-synephrine-containing *Citrus aurantium* extract at the doses of 250, 500, 1000, and 2000 mg/kg/day had no appreciable impact on the body weights, relative and absolute organ weights, clinical chemistry and hematological parameters, gross pathological findings, or food intake of the experimental animals [21]. Two male rats with gastrointestinal impaction had perished after taking 2000 mg/kg, it was determined during necropsy. Additionally, during the second week of treatment with 1000 mg/kg and 2000 mg/kg/day for 15 and 45 min, respectively, rats were reported to exhibit brief indications of repeated head-burrowing in the bedding material (hypoactivity) [21]. Despite the short-term and transient clinical symptoms that were noticed at the dose, it was decided that the maximum tolerated dose (MTD) of *Citrus aurantium* extract standardized to 50% p-synephrine was 1000 mg/kg/day [21]. 500 mg/kg body weight was the no-observed-effect-level (NOEL) for *Citrus aurantium* extract in the study. The researchers contended that *Citrus aurantium* extract had a sufficiently large margin of safety to satisfy any serious concerns. *Citrus aurantium* was tested for safety in rats over a sub-chronic 90-day period by Deshmukh et al. [20], who discovered that doses of 100, 300, and 1000 mg/kg/day of the 50% p-synephrine-containing extract exhibited no unfavorable clinical effects. Furthermore, the extract's NOEL was 300 mg/kg, and its no-observed-adverse-effect-level (NOAEL) was 1000 mg/kg, according to the authors' assertions [20]. The authors highlighted that *Citrus aurantium* extract is quite safe as a result.

Despite having useful characteristics, *Citrus aurantium* essential oil has been demonstrated to contain a small amount of toxicity [146]. *Citrus aurantium* essential oil was neither an irritant nor a sensitizer to 25 volunteers when tested at 10%, but it did produce sensitivity in 1.5% of all dermatitis patients when tested at 2% [147–149]. *Citrus aurantium* essential oil has also been linked to an increase in light sensitivity, especially in those with fair skin. When an essential oil is eaten, photosensitivity occurs more frequently than when it is administered topically to the skin and exposed to bright light [35]. As a result, it is advisable to avoid staying out in the sun for too long after applying the oil.

6 Research Needs for *Citrus aurantium* as a Therapeutics

Different authors have suggested that in order to fully understand the therapeutic potentials of plants it will be important to identify, isolate, and purify the bioactive compounds that make the plant confer such therapeutic potentials [48, 49, 51, 52, 150–156].

To gain a comprehensive understanding of the therapeutic advantages of *Citrus aurantium*, it is imperative to bridge the information gap among the available studies. Various aspects of toxicity, including acute, sub-acute, and chronic toxicities, alongside the pharmacological safety profiles of the plant, necessitate thorough investigation. Before embarking on clinical trials, it is essential to research the short-term and long-term toxic effects of the plant's compounds on animals. To facilitate this endeavor, a comprehensive grasp of the precise chemical composition of these molecules is crucial. This understanding will facilitate a more profound insight into the metabolic processes that give rise to these beneficial compounds. Moreover, an enhanced comprehension of metabolic engineering can significantly improve the synthesis and accumulation of these compounds. *Citrus aurantium* holds significant importance in sustainable biodiversity preservation and utilization for both current society and future generations. The bitter orange plant not only offers novel opportunities to develop innovative medications to address a spectrum of debilitating ailments [157], but it also remains an extensively untapped source for isolating and characterizing specific chemical components.

Studies investigating the bioactivity potential of *Citrus aurantium* have revealed a diverse array of biological effects attributed to its flowers, fruits, essential oils, and phytoconstituents. These effects encompass antimicrobial, antioxidant, cytotoxic, anxiolytic, antidiabetic, anti-obesity, and anti-inflammatory properties [3]. Nevertheless, further comprehensive and prolonged research is imperative to ensure the plant's safety, particularly with regard to understanding interactions between the plant's components and medications, as well as determining appropriate dosage levels. P-synephrine, characterized as a relatively inefficient adrenergic agonist, is not expected to have notable effects on the cardiovascular system. It's worth noting that despite the absence of concrete evidence pointing to potential toxicity or cardiovascular risks, the NCAA has prohibited its use. In contrast, the World Anti-Doping Agency (WADA), an organization collaborating with Olympic athletes, permits its usage [3].

Multiple scientific studies have underscored the distinct advantages that *Citrus aurantium* holds over other citrus species. Comparative analyses have consistently highlighted bigarade leaves, juice, or flowers as possessing the highest levels of total phenolic content (TPC), total flavonoid content (TFC), and antiradical activity. A significant category of bioactive compounds, including phenols, flavonoids, alkaloids, vitamin C, and essential oils, furnishes compelling evidence. These secondary metabolites confer a range of beneficial biological and therapeutic properties, such as antioxidants, antibacterial agents, anti-cancer agents, anti-diabetic agents, anti-obesity agents, and anxiolytics. Moreover, their utility extends to the cosmetic and functional food sectors, where these compounds find diverse applications. While most of these bioactive components are distributed throughout the entirety of the *Citrus aurantium* plant, distinct identity markers for phytochemical content and proportions have been identified in various plant sections. Remarkably, certain byproducts resulting from the processing of *Citrus aurantium*, such as the peels left behind after juice extraction, emerge as significant reservoirs of valuable biomolecules with promising potential applications. This underscores the importance of repurposing residual biomass, traditionally viewed as waste, within the context of the evolving bioeconomy. Literature also outlines the extraction techniques employed to obtain the bioactive constituents from *Citrus aurantium*. However, to comprehensively grasp their mechanisms of action and ascertain safety via interactions with biological models, advanced clinical research mandates the incorporation of further analytical methods to fractionate and purify these active components [53].

The identification criteria for *Citrus aurantium* present ample opportunities for enhancement. Variations in origins and cultivation practices can lead to significant variations in components due to the distinctive nature of Chinese herbals and diverse cultivation methods. The concurrent presence of multiple chemical elements and compounds often results in varying outcomes in pharmacological activity tests. Because of these conflicting factors, certain extracts utilized in research fail to provide comprehensive details about their extraction procedures or processing conditions. Moreover, some studies have not successfully established accurate identification of *Citrus aurantium* or precise descriptions of extraction sites. These issues contribute to a decline in the overall quality of studies, thereby diminishing their utility as credible references.

Citrus aurantium has yielded over a hundred types of chemicals, many of which exhibit bioactivity. While investigations verifying pharmacological activity have mainly concentrated on specific constituents, such as flavonoids from *Citrus aurantium*'s peel, limited attention has been given to other bioactive components like limonins, organic acids, and additional phenols. Consequently, more reliable, and substantiated data are essential to support the concept of *Citrus aurantium's* "multi-target, comprehensive intervention." Further clarification and comprehensive exploration of the bioactive constituents and pharmacological processes of *Citrus aurantium* are imperative. Notably, researchers frequently prioritize outcomes and overlook the comprehensive mechanisms through which the active components in *Citrus aurantium* contribute to disease prevention and treatment.

The future of medical research on *Citrus aurantium* will revolve around developing activity screening models rooted in pharmacological actions, unearthing novel bioactive ingredients, and dissecting its pharmacological mechanisms. Key areas of focus include establishing robust sources and diversity identification criteria for *Citrus aurantium*, incorporating innovative activity screening models into pharmacological evaluations, and leveraging advanced technologies such as digital light processing and 3D printing to align research with clinical application criteria. Furthermore, despite traditional uses and preliminary evidence from animal models suggesting *Citrus aurantium*'s potential in treating lung and bronchial issues, the current findings lack solid scientific substantiation. The importance of accumulating toxicological and pharmacokinetic data cannot be overstated, as it lays the groundwork for clinical research and the development of *Citrus aurantium*-related products [1].

Citrus peel, leaves, and blossoms harbor essential oils of remarkable value for various reasons. Citrus fruits represent one of the most cultivated fruit crops globally, resulting in the ready availability of these oils as byproducts of citrus processing. The prized attributes of citrus essential oils, which encompass therapeutic benefits related to scent, along with fungicidal, virucidal, and bactericidal activities, render them valuable constituents in cosmetics, fragrances, and potentially eco-friendly substitutes for chemical-based antimicrobials in diverse applications. These characteristics have the potential to drive "green consumerism," promoting the utilization and cultivation of plant products. However, achieving standardization in commercial citrus essential oil composition and conducting further studies to unravel the mechanisms of action of active chemicals remain vital endeavors [158]. There remains ample room for refining their utilization and application.

7 Conclusion

The *Citrus aurantium*, often called bitter or sour orange, is necessary for various utilizations, both in the pharmacological and non-pharmacological world. People have, throughout history, looked to nature as a source of health and well-being for themselves. *Citrus aurantium* is a plant that stands out among traditionally beneficial in increasing physical fitness. Numerous phytochemical components that may be found in *Citrus aurantium* have been shown to have close relationships to the fruit's wide variety of beneficial biological effects, such as the treatment of cancer, gastrointestinal issues, inability to sleep, headaches, and spasticity. *Citrus aurantium* is a very intriguing compound because, in addition to its significant role in the field of pharmacology, it also has a wide variety of applications outside of the pharmaceutical industry. It is used as a pesticide, a source of raw materials for the pulp and paper business, and aromatic properties for the food preservation and processing and cosmetics industries, and it has the potential to work as an anti-aging agent. *Citrus aurantium* and the products derived from it have an incredible number of benefits. Yet, the usage of *Citrus aurantium* has also been connected to a variety of adverse side effects. Even though specific investigations have mostly exonerated the plant of any safety infractions, other research has questioned the matter.

Abstract

This chapter explores the botanical characteristics, traditional uses, culinary applications, and medicinal properties of the medicinal spice, *Afromomum melegueta* [Roscoe.] K. Schum., Zingiberaceae (Guinea pepper or Grain of Paradise). The herbaceous plant is part of the cultural identity and heritage of West Africa where it is considered to have originated and has been used and cultivated for centuries and plays vital roles in traditional medicine, rituals, and ceremonies of various Indigenous cultures in the region and other parts of the world. *A. melegueta* is also cultivated in parts of Central and South America, the Caribbean, Southeast Asia, and some regions of Oceania. It was one of the valuable commodities exchanged along with other spices, such as black pepper and cardamom, through the trans-Saharan trade routes. Some of the culinary uses and applications of *A. melegueta* include spice, flavor enhancer, distilled spirit, baking, seasoning blend, craft brewing, and condiments. The herbal medicinal value, distinctive aroma, and fragrance of the plant are attributed to phytochemical constituents such as essential oils (like myristicin, limonene, beta-caryophyllene, and pinene), fatty acids, terpenoids, tannins, glycosides, steroids, carotenoids, phenols, alkaloids, flavonoids, vitamins, and minerals. Some ethnomedicinal uses of the plant seed (oil and extract) include digestive aid, anti-inflammatory, antioxidant properties, weight reduction and management, pain relief, respiratory health, antimicrobial, stomach upset, aphrodisiac, and fever reduction. However, further pharmacognostic and clinical research is required to verify the ethnomedical benefits of the plants. Business opportunities abound in the cultivation, processing and packaging, export and import, culinary ventures, health and wellness products, and fair trade initiative aspects of the plant. As global interest in spice continues to grow, it is essential to prioritize sustainable cultivation practices, fair trade, and phytomedical exploration of vital medicinal spices like *A. melegueta* to ensure its long-term availability, conservation, sustainable utilization, and benefit to local communities.

Guinea pepper · Medicinal spice · Herbal products · Herbal medicine · Grain of paradise · Phytochemicals

1 Introduction

Aframomum melegueta [Roscoe.] K. Schum, commonly known as Guinea pepper or Grains of Paradise, is a spice and medicinal plant native to West Africa. It belongs to the Zingiberaceae family, which also includes ginger and turmeric. Guinea pepper has a long history of culinary and medicinal use and plays a significant role in the culture and cuisine of the regions where it grows. *A. melegueta* is believed to have originated in the rainforests of West Africa, specifically in the region that includes present-day Nigeria, Ghana, and Ivory Coast [50, 78]. This perennial plant thrives in the hot and humid tropical climate of the African rainforests, where it can be found growing both in the wild and under cultivation. The name "Grains of Paradise" is often used to refer to the seeds of *A. melegueta*. The term "paradise" in this context alludes to the spice's exotic and prized nature, which was highly valued in medieval Europe [87, 95]. *A. melegueta* is a robust herbaceous plant characterized by its large leaves, tall stalks, and unique flowering structures. The plant's leaves are large, oblong, and typically dark green. They grow alternately along the stems. The stems of Guinea pepper can reach a height of up to 2 meters (6.6 feet). They are sturdy and bear the plant's leaves and flowers. Guinea pepper produces beautiful, red-veined flowers that grow in spike-like clusters. The flowers are tubular and have a distinctive appearance [8, 9]. The fruit of *A. melegueta* is a capsule containing numerous seeds. These seeds, known as Guinea grains or Grains of Paradise, are the primary part of the plant used for culinary and medicinal purposes. Although the seeds are the most famous part of the plant, the roots and rhizomes also contain aromatic compounds and have been used in traditional medicine [6, 29, 30].

In recent years, *A. melegueta* has gained recognition in the global culinary scene. Chefs and food enthusiasts have rediscovered its unique flavor and have started to incorporate it into their dishes [5]. This revival has led to increased demand for Grains of Paradise in international markets. The spice trade, which historically included Grains of Paradise among its prized commodities, has seen a resurgence in interest. Small-scale farmers in West Africa are cultivating Guinea pepper to meet the growing demand from gourmet chefs and artisanal food producers worldwide. Grains of Paradise has a rich history in culinary traditions, both in Africa and beyond. They are known for their complex flavor profile, which includes notes of citrus, pepper, and warmth. Some of the culinary uses and applications of *A. melegueta* include the following:

Spice: Grains of Paradise is primarily used as a spice to season a wide range of dishes. They are often used in small quantities due to their potent flavor. In West African cuisine, they are a key ingredient in spice blends like pepper soup spice and suya spice [69].

Flavor Enhancer: Guinea pepper can enhance the flavor of meats, stews, soups, and sauces. It is particularly well-suited for game meats and hearty, savory dishes [71].

Distilled Spirits: Grains of Paradise is a botanical ingredient in some gin recipes, contributing to the complexity of the spirit's flavor [67–69].

Baking: In European cuisines, Grains of Paradise was historically used in baking, especially in gingerbread and spiced bread recipes [82].

Seasoning Blends: They are sometimes added to spice blends, such as garam masala, to provide a unique and exotic flavor [69, 71].

Craft Brewing: In recent years, craft brewers have experimented with adding Grains of Paradise to beer recipes, creating unique and flavorful brews [90].

Condiments: Guinea pepper can be used to make flavored oils and vinegar, adding a spicy kick to dressings and marinades [90].

In African cuisines, Guinea pepper is more than a spice; it is part of the cultural identity and heritage of the region. However, in addition to its culinary applications, *A. melegueta* has a rich history of traditional uses in various cultures. It has been valued for its medicinal properties and has played a role in religious and cultural practices. In traditional African medicine, Guinea pepper has been used to treat a wide range of ailments. It is believed to have digestive, anti-inflammatory, antimicrobial, and analgesic properties [11, 20, 51]. Grains of Paradise has a reputation as an aphrodisiac in some cultures. They have been used to enhance libido and sexual performance [7]. In some African cultures, Guinea pepper has been used as a protective charm or talisman to ward off evil spirits and negative energy. The seeds have been used in religious rituals and ceremonies in West African traditional religions. Guinea pepper has been associated with prosperity, abundance, and good fortune in some African cultures. While traditional medicine has long recognized the medicinal properties of *A. melegueta*, modern research has begun to shed light on the potential health benefits of this spice [14]. Some areas of interest include the following:

Anti-inflammatory: Grains of Paradise contains compounds with anti-inflammatory properties, which may have applications in reducing inflammation and related conditions.
Antioxidant: The spice is a source of antioxidants, which can help protect cells from oxidative stress and damage.
Digestive Health: In traditional medicine, Guinea pepper has been used to aid digestion. Some research suggests that it may have gastroprotective effects.
Metabolic Health: Preliminary studies have explored the potential impact of Guinea pepper on metabolic health, including its role in regulating blood sugar levels and promoting weight management.
Analgesic: Some traditional uses of Guinea pepper include pain relief. Research into its analgesic properties is ongoing.

This chapter aims to discuss the phytomedicinal value of *A. melegueta*. It presents the origin, distribution, and botany of *A. melegueta* wherein it is shown that the widespread distribution of the plant has led to its incorporation into a variety of culinary and medicinal traditions. This includes culinary and traditional medicine uses. The next sections address the origin, distribution, botanical, nutritional, and phytochemical properties as well as the food uses of *A. melegueta*. Other parts of the chapter are on the ethnobotanical, pharmacognosy, and clinical works, herbal products, toxicity, and commercial values of *A. melegueta*. It is believed to have various medicinal properties, including digestive, anti-inflammatory, and antimicrobial effects [20, 66]. *A. melegueta* is a crop with great potential for sustainable cultivation. It thrives in the agroforestry systems of West Africa, where it can be grown alongside other crops, such as cocoa and oil palms. This intercropping approach contributes to biodiversity and provides additional income to farmers. Sustainability practices, including organic cultivation and fair-trade principles, are being promoted to ensure that the production of Guinea pepper benefits both farmers and the environment.

2 Origin and Distribution of *Aframomum melegueta*

Aframomum melegueta, commonly known as Guinea pepper or Grains of Paradise, is native to West Africa. It is believed to have originated in the tropical rainforests of this region. Specifically, the plant's natural habitat spans several West African countries, including Nigeria, Ghana, Ivory Coast, Liberia, Sierra Leone, and Togo [36]. However, the exact place of origin within this region is difficult to pinpoint precisely, as Guinea pepper has been used and cultivated in West Africa for centuries, making it an integral part of the region's culinary and cultural heritage. Cultivation efforts can be found in parts of Central and South America, the Caribbean, Southeast Asia, and some regions of Oceania [12]. In these areas, it is grown to meet the global demand for this unique spice. Guinea pepper's name (pride of paradise) alludes to the historical trade routes that brought this spice to Europe during the medieval period. It was one of the valuable commodities exchanged along with other spices, such as black pepper and cardamom through trans-Saharan trade routes [33, 34]. These trade networks connected West Africa to Europe, the Middle East, and Asia, introducing the world to the unique flavors of Guinea pepper.

In its native West Africa, Guinea pepper is not only a spice but also a symbol of cultural identity and heritage. It has played a significant role in traditional medicine, rituals, and ceremonies of various Indigenous cultures in the region. Today, Guinea pepper remains an essential part of West African cuisines and is also gaining recognition in the global culinary scene for its distinct and complex flavor profile. While Guinea pepper is now cultivated in other parts of the world due to its increasing popularity, its true origin and cultural significance are deeply rooted in the vibrant and diverse landscapes of West Africa. Guinea pepper is primarily native to West Africa [17, 93]. This region is where the plant has its natural habitat and has been traditionally grown and used for centuries. However, due to its popularity in culinary and medicinal applications, it has garnered interest worldwide, leading to its cultivation in various regions beyond its native habitat. Today, *A. melegueta* is cultivated in other tropical regions around the world. These regions typically share a similar climate to its native West Africa, characterized by a hot and humid tropical climate. Countries in Central and South America, the Caribbean, Southeast Asia, and parts of Oceania have seen cultivation efforts to meet the growing global demand for Guinea pepper. Guinea pepper has gained recognition as a unique and flavorful spice in international cuisines. As a result, it is traded and used by chefs, culinary enthusiasts, and the food industry in many parts of the world. While it may not be grown commercially in all these regions, it is imported and incorporated into dishes and spice blends. In some countries with suitable climates, *A. melegueta* is cultivated as a horticultural or ornamental plant. These efforts may not necessarily be for commercial spice production but for the plant's esthetic and aromatic qualities. In regions with nontropical climates, such as parts of Europe and North America, Guinea pepper is occasionally grown in controlled environments like greenhouses. This allows for cultivation in climates that would otherwise be unsuitable. The spice is valued for its unique flavor profile, reminiscent of citrus and pepper, and has made it a sought-after ingredient in global cuisine.

3 Botanical Characteristics of *Aframomum melegueta*

The ecology of *A. melegueta* is closely tied to its native habitat in West Africa. This perennial plant thrives in tropical regions with well-drained, fertile soils and adequate rainfall. It typically grows in the understory of rainforests, benefiting from the partial shade provided by taller trees. Physiologically, *A. melegueta* is characterized by its rhizomatous growth, with shoots emerging from underground rhizomes. It produces lance-shaped leaves and distinctive red or orange fruits that contain aromatic seeds. The plant's physiology enables it to adapt to its native rainforest environment, where it plays a role in the ecosystem and serves as a valuable spice in human cultures.

According to Amponsah et al. [9], botanically, *A. melegueta* is a herbaceous perennial plant. Herbaceous plants lack woody stems and persist for several growing seasons. The plant typically reaches a height of 1–2 meters (3.3–6.6 feet) when fully mature. The leaves of Guinea pepper are large, oblong, and dark green. They are arranged alternately along the stems. The leaves contribute to the plant's lush appearance. The stems of *A. melegueta* are sturdy and upright. They support the plant's leaves, flowers, and fruits. The stems are green and become more lignified (woody) as the plant matures. Guinea pepper produces striking, tubular flowers. The flowers are often described as being red-veined and have a distinctive appearance. They grow in clusters on spike-like inflorescences. The flowering period can vary depending on growing conditions. The fruit of *A. melegueta* is a capsule that contains numerous small seeds. These seeds are the part of the plant most commonly used as a spice and are known as Grains of Paradise. The capsules are typically brown or reddish-brown when mature. While the seeds are the most famous part of the plant, the roots and rhizomes of Guinea pepper also contain aromatic compounds. In traditional medicine and some culinary applications, the roots and rhizomes are used along with the seeds. Guinea pepper has a clumping growth habit, meaning that it forms clusters of stems arising from the same underground rhizome. This growth habit helps the plant spread in its natural habitat. The seeds of *A. melegueta* are known for their aromatic and complex fragrance, which includes notes of citrus, pepper, and warmth [3]. This unique fragrance is a key factor in their culinary and medicinal uses. The plant is native to the tropical rainforests of West Africa, where it thrives in the hot and humid climate. It is often found growing in the understory of the rainforest, receiving filtered sunlight with other tropical crops [57, 64, 65]. These morphological characteristics, including the unique appearance of the flowers and the aromatic seeds, make *A. melegueta* easily recognizable. The seeds, in particular, are highly prized for their flavor and fragrance, which have contributed to their historical and contemporary culinary and medicinal uses.

In addition to its ecology within its native range, Guinea pepper is cultivated in tropical regions worldwide. Cultivation practices aim to replicate the plant's native growing conditions to ensure healthy growth and the production of high-quality seeds. The plant has a distinctive appearance, and aromatic seeds have made it a sought-after spice in culinary traditions worldwide. It is known for its complex flavor profile, which combines elements of citrus, pepper, and warmth, making it a valuable addition to a wide range of dishes and spice blends.

4 Nutritional Value and Uses of *Aframomum melegueta*

Aframomum melegueta is not primarily consumed for its nutritional content but for its unique flavor and aromatic properties [40]. Nonetheless, *A. melegueta* contains many vital nutritional components but is not a significant source of macronutrients like carbohydrates, proteins, or fats. However, it does contain various bioactive compounds and phytochemicals that contribute to its flavor and potential health benefits. Some of the nutritional components and bioactive compounds found in Guinea pepper are as follows:

Essential Oils: Guinea pepper seeds contain essential oils, which are responsible for their distinctive aroma and flavor. These oils include compounds like myristicin, limonene, and pinene, which contribute to its complex fragrance [19].

Phenolic Compounds: Phenolic compounds are antioxidants found in Guinea pepper. These compounds have potential health benefits due to their ability to neutralize harmful free radicals in the body [1, 24].

Alkaloids: Some alkaloids, such as guineensine and aframonine, are present in Guinea pepper. These compounds may have bioactive properties and could contribute to their medicinal uses [18].

Flavonoids: Flavonoids are a group of polyphenolic compounds known for their antioxidant properties. While Guinea pepper contains some flavonoids, they are not a primary source [16].

Vitamins and Minerals: Guinea pepper is not a significant source of vitamins and minerals [53]. However, it may contain trace amounts of vitamins and minerals depending on the soil and growing conditions.

The primary use of Guinea pepper is as a spice. Its seeds are used to flavor a wide range of dishes, including soups, stews, sauces, and meat-based dishes. It adds a complex, citrusy, and peppery flavor with a hint of warmth. Grains of Paradise is often included in spice blends, such as garam masala, curry blends, and various regional spice mixtures. It enhances the overall flavor profile of these blends. In historical European cuisines, Guinea pepper was used in baking, particularly in gingerbread and spiced bread recipes. It added depth and complexity to baked goods. Some gin recipes include Guinea pepper as a botanical ingredient. It contributes to the flavor complexity of the spirit. Guinea pepper can be used to make flavored oils, vinegar, and condiments. These are used to add a spicy kick to dressings, marinades, and dipping sauces.

In West African traditional medicine, Guinea pepper has been used to treat various ailments. It is believed to have digestive, anti-inflammatory, and analgesic properties. Some traditional uses of Guinea pepper include its role in promoting digestive health. It has been used to alleviate digestive discomfort and stimulate appetite. Research into the anti-inflammatory properties of Grains of Paradise is ongoing, and it may have potential applications in reducing inflammation. The phenolic compounds in Guinea pepper give it antioxidant properties, which can help protect cells from oxidative stress and damage. In traditional medicine, Guinea pepper has been used for pain relief. While more research is needed, some studies suggest it may have analgesic effects. In some cultures, Guinea pepper has been considered an aphrodisiac, believed to enhance libido and sexual performance. In certain African cultures, Guinea pepper has been used as a protective charm or talisman to ward off evil spirits and negative energy. The seeds of Guinea pepper have been used in religious rituals and ceremonies in West African traditional religions. The spice is associated with prosperity, abundance, and good fortune in some African cultures and has cultural significance in various rituals and celebrations [31, 58–60]. In recent years, Guinea pepper has experienced a culinary revival. Chefs and food enthusiasts have rediscovered its unique flavor and have started to incorporate it into their dishes. This has led to an increased demand for Grains of Paradise in international markets. The global spice trade has also seen a resurgence of interest in Guinea pepper. Small-scale farmers in West Africa are cultivating Guinea pepper to meet the growing demand from gourmet chefs and artisanal food producers worldwide.

5 Global *Aframomum melegueta* Business, Market, and Supply Chain

Aframomum melegueta, commonly known as Guinea pepper or Grains of Paradise, has gained recognition in the global market due to its unique flavor profile and potential health benefits. To understand the global business, market, and supply chain of *A. melegueta*, there is a need to explore various aspects, including production regions, market trends, supply chain dynamics, and business opportunities.

5.1 Production Regions

West Africa is the primary production region of *A. melegueta*: Guinea pepper is primarily cultivated and harvested in West African countries, including Nigeria, Ghana, Ivory Coast, Liberia, Sierra Leone, and Togo. These countries have the ideal tropical rainforest climate for its growth. However, expansion to other tropical regions is ongoing due to increasing global demand. Hence, cultivation efforts have expanded to other tropical regions worldwide. Central and South American countries, the Caribbean, Southeast Asia, and parts of Oceania have seen cultivation initiatives to meet the growing demand for this unique spice.

5.2 Market Trends

Guinea pepper has experienced a culinary revival in recent years, with chefs and food enthusiasts appreciating its complex flavor. It is increasingly used in gourmet cuisine, craft beverages, and artisanal food products [54–56, 76]. The spice's potential health benefits, including anti-inflammatory and antioxidant properties, align with consumer trends toward healthier eating. This has driven interest in incorporating Guinea pepper into wellness-focused products. Some gin producers include Guinea pepper as a botanical ingredient in their recipes. The craft beverage industry's growth has contributed to increased demand. Guinea pepper is integral to various ethnic and regional cuisines, particularly in West African and North African dishes. The growing popularity of these cuisines has expanded its market. Guinea pepper is a key component of spice blends such as garam masala, curry blends, and regional seasoning mixtures. These blends are popular for their convenience and flavor enhancement.

5.3 Supply Chain Dynamics of *A. melegueta*

Cultivation: The supply chain begins with the cultivation of *A. melegueta*. Small-scale farmers in West Africa often grow it alongside other crops like cocoa and oil palms.

Harvesting: Guinea pepper is harvested when the capsules containing the seeds mature and turn brown or reddish-brown. Harvesting methods can vary but typically involve manually plucking the capsules.

Processing: After harvesting, the seeds are separated from the capsules. Depending on the scale of production, this can be done manually or with the help of machinery.

Packaging: Processed seeds are typically packaged in airtight containers to preserve their flavor and aroma. Packaging may vary based on market destinations, including bulk packaging for wholesale and retail-ready packaging for consumer markets.

Distribution: Distribution channels include local markets, international spice traders, and specialty food distributors. Guinea pepper is often imported by countries worldwide.

Retail and Consumer: Grains of Paradise is available in various forms, including whole seeds and ground spice. Consumers can purchase them in stores or online for use in culinary applications and home cooking.

5.4 Business Opportunities with *A. melegueta*

Business opportunities exist in the following areas concerning *A. melegueta:*

Cultivation: Entrepreneurs and agricultural investors can explore opportunities in cultivating Guinea pepper, especially in regions with suitable climates.

Processing and Packaging: Establishing processing and packaging facilities for Guinea pepper seeds can create value-added products for export and local markets.

Export and Import: International traders can participate in the export-import business of Guinea pepper, connecting producers in West Africa with global markets.

Culinary Ventures: Chefs, culinary entrepreneurs, and food manufacturers can incorporate Guinea pepper into their products to meet the demand for unique and exotic flavors.

Health and Wellness Products: Developing health and wellness products that incorporate Guinea pepper's potential health benefits can tap into consumer interest in functional foods.

Sustainable and Fair-Trade Initiatives: Supporting sustainable and fair-trade practices in the supply chain can create business opportunities focused on ethical and environmentally responsible sourcing.

6 Ethnomedicinal Value of *Aframomum melegueta*

Aframomum melegueta contains a variety of primary and secondary phytochemicals, which contribute to its flavor, aroma, and potential health benefits. Some of the primary and secondary phytochemicals found in *Aframomum melegueta* are the following:

Essential Oils: Guinea pepper seeds are rich in essential oils, which are responsible for their distinct aroma and flavor [49, 80]. Some of the primary components of these essential oils include myristicin, limonene, pinene, and beta-caryophyllene [23, 43, 85]. Some of the properties of these essential oils include the following:

- Myristicin: known for its aromatic and spicy flavor
- Limonene: imparts citrusy notes to the spice
- Pinene: adds pine-like and woody aromas
- Beta-caryophyllene: contributes to the spice's peppery and earthy character

Fatty Acids: While not a primary source, Guinea pepper seeds contain small amounts of fatty acids, including oleic acid and linoleic acid [27, 47].

Phenolic Compounds: Phenolic compounds are antioxidants found in Guinea pepper [3, 45, 75]. These secondary metabolites have potential health benefits due to their ability to neutralize harmful free radicals. Examples of phenolic compounds in Guinea pepper include vanillic acid, caffeic acid, syringic acid, quercetin, and kaempferol. Some of the properties of these compounds include the following:

- Vanillic acid: known for its sweet and vanilla-like flavor
- Caffeic acid: has antioxidant properties and contributes to the spice's flavor
- Syringic acid: an antioxidant with potential health benefits

- Quercetin: a flavonoid with anti-inflammatory properties
- Kaempferol: another flavonoid with antioxidant and anti-inflammatory effects

Alkaloids: Some alkaloids are present in Guinea pepper seeds, and while they are not primary sources, they may have bioactive properties [28]. Examples of alkaloids found in *Aframomum melegueta* include guineensine, malic acid, and aframonine [38, 77, 81].

Flavonoids: Flavonoids are a group of polyphenolic compounds with antioxidant properties [73]. While Guinea pepper contains some flavonoids, they are not the primary source of these compounds.

Terpenoids: Terpenoids are secondary metabolites found in Guinea pepper, contributing to its aromatic properties [6]. Some terpenoids include limonene and pinene.

Sesquiterpene Lactones: While not as common as other compounds, some sesquiterpene lactones have been identified in Guinea pepper [26, 41, 91]. These compounds are known for their diverse biological activities.

Tannins: Tannins are polyphenolic compounds that may be present in Guinea pepper, albeit in relatively small quantities [10, 39]. They can contribute to the astringency of the spice.

Glycosides: Some glycosides may be found in Guinea pepper seeds, though their presence and types can vary ([46]; 2017).

Steroids: Steroids are compounds that may be present in small quantities in Guinea pepper, contributing to its chemical diversity [79].

Carotenoids: While not as prominent as in some other spices, Guinea pepper may contain trace amounts of carotenoids, which are responsible for the coloration of some fruits and vegetables [61, 62, 86].

It is important to note that the exact composition of phytochemicals in Guinea pepper can vary based on factors such as the plant's growing conditions, location, and maturation. These phytochemicals collectively contribute to the unique flavor, aroma, and potential health benefits associated with *A. melegueta*. Additionally, ongoing research continues to uncover the diverse chemical constituents present in this spice, further deepening our understanding of its properties and potential uses. While further research is needed to fully understand the bioactive properties of Guinea pepper, it continues to be a popular and intriguing spice in the culinary world with potential applications in functional foods and traditional medicine.

Some of the ethnomedical uses of the bioactive compound in *A. melegueta* include the following:

- **Digestive Aid**: In traditional African medicine, Guinea pepper has been used to aid digestion. It is believed to stimulate the digestive system, relieve indigestion, and alleviate gastrointestinal discomfort [22, 29].
- **Anti-inflammatory**: Guinea pepper has been traditionally employed as an anti-inflammatory agent. It is used to reduce inflammation and soothe inflammatory conditions such as arthritis and joint pain [52].
- **Antioxidant Properties**: The phenolic compounds found in Guinea pepper are antioxidants. Antioxidants help protect cells from oxidative stress and damage

caused by free radicals. Traditional uses may include harnessing these antioxidant properties for overall health [63, 74].

- **Pain Relief**: In some traditional healing practices, Guinea pepper has been used for relief from pain and rheumatism [13, 92]. It is believed to have analgesic properties and may be used topically or consumed to alleviate pain. Aqueous seed extract of grain of paradise has been shown to possess peripheral analgesic activity through actinociceptive activity of the intraperitoneal dose [88, 92].
- **Respiratory Health**: Guinea pepper has been used in traditional remedies for respiratory issues such as coughs and congestion [21]. It may be used as an ingredient in herbal formulations to help ease respiratory discomfort. The study by El Dine et al. [21] showed that the methanolic extract of the plant has antiadhesive concentration-dependent effects on microorganisms in the lung carcinoma line.
- **Antimicrobial and Antihelminthic**: Some cultures have used Guinea pepper as an antimicrobial and antihelminthic agent [37]. It may be employed to help combat infections, although further research is needed to confirm its efficacy [44, 70].
- **Aphrodisiac**: In certain African cultures, Guinea pepper has been considered an aphrodisiac. It is believed to enhance libido and sexual performance, and it is sometimes included in preparations meant to boost sexual vitality [4, 15, 35].
- **Ritual and Spiritual Uses**: Guinea pepper has cultural and spiritual significance in some African traditions. It is used in rituals, ceremonies, and protective charms to ward off evil spirits and promote positive energy [25, 32, 83].
- **Weight Reduction and Management**: The plant seeds and seed extracts are consumed to reduce and manage weight in many Indigenous communities across the world including diabetic patients [48, 84, 89]. The work of Yoneshiro et al. [96] suggest the plant extract adopts adoptive thermogenesis to reduce body fat in humans.
- **Stomach Upset**: Guinea pepper is sometimes used to alleviate stomach upset, including nausea and vomiting, in traditional medicine [42]. López-Ríos et al. [42] reported that the plant seed is taken by postmenopausal women as a remedy for hot flashes, anxiety, and depressive symptoms.
- **Cardiovascular Protection**: The seed and seed extract of the plant is taken to protect and increase cardiovascular activities. It is also used to treat hypertension in Indigenous communities in the Global South [2].
- **Fever Reduction**: In some African cultures, Guinea pepper has been used to help reduce fever and alleviate symptoms of illnesses associated with fever.
- **Nephroprotection:** The seed and seed extract of the plant is taken to reduce kidney injury and protect the organ from adverse damage [2].

Table 1 presents some of the ethnomedicinal properties of *A. melegueta* as well as the parts used and bioactive compounds responsible for the effects.

Table 1 Ethnomedicinal properties of *A. melegueta* as well as the parts used and bioactive compounds responsible for the effects

Ethnomedical uses	Part used	How it is used	Bioactive compound responsible
Digestive aids	Seeds	Crushed or powdered seeds are often added to food or herbal formulations to aid digestion and relieve indigestion	Myristicin, limonene, pinene, and phenolic compounds
Anti-inflammatory	Seeds, oil	Seeds may be ingested, or oil extracts are applied topically to reduce inflammation and alleviate joint pain	Phenolic compounds, and terpenoids
Antioxidant properties	Seeds, extracts	Guinea pepper seeds or extracts are consumed to provide antioxidant support for overall health	Phenolic compounds, flavonoids, and terpenoids
Pain relief	Seeds, oil	Seeds may be crushed and applied topically as poultices or mixed with carrier oils for massage to alleviate pain	Phenolic compounds, terpenoids, and alkaloids
Respiratory health	Seeds, preparations	Seeds are sometimes included in herbal preparations for respiratory issues, promoting clear airways	Terpenoids and essential oils
Antimicrobial agent	Seeds, extracts	Extracts or powdered seeds are used in traditional remedies to combat infections, both topically and internally	Terpenoids, phenolic compounds, and alkaloids
Aphrodisiac	Seeds, preparations	Ground seeds may be included in aphrodisiac preparations believed to enhance libido and sexual vitality	Alkaloids and terpenoids
Ritual and spiritual uses	Seeds, whole	Whole seeds are used in rituals, ceremonies, and protective charms to ward off negative energy and evil spirits	Cultural and spiritual significance
Stomach upset	Seeds	Seeds are occasionally used to soothe stomach upset, including nausea and vomiting	Terpenoids and phenolic compounds
Fever management and reduction	Seeds	Seeds are sometimes used to reduce fever and alleviate symptoms associated with fever	Terpenoids and alkaloid

7 Pharmacognosy and Clinical Research on *Afromomum melegueta*

7.1 Pharmacognosy of *Aframomum melegueta*

Pharmacognosy is the study of natural products from plants and other natural sources to understand their properties, composition, and potential pharmacological uses. *Aframomum melegueta* has been of interest to pharmacognosists and researchers due to its unique bioactive compounds [73]. Some aspects of the pharmacognosy of *Aframomum melegueta*:

Morphological Identification: Pharmacognosists study the morphological characteristics of the plant, including its leaves, flowers, and seeds, to ensure proper identification. Guinea pepper is known for its distinctive seeds enclosed in capsules.

Chemical Composition: Researchers analyze the chemical composition of Guinea pepper, including its essential oil content and specific bioactive compounds. Gas chromatography-mass spectrometry (GC-MS) is often used to identify the chemical constituents.

Quality Control: Pharmacognosists are involved in establishing quality control standards for Guinea pepper products. This helps ensure that commercial products meet certain quality criteria.

Extraction and Isolation: Techniques for extracting and isolating bioactive compounds from Guinea pepper are explored, allowing for further studies on their properties and potential applications.

Phytochemical Screening: Researchers conduct phytochemical screening to identify the presence of various compounds, such as alkaloids, flavonoids, phenolic compounds, and terpenoids, which contribute to the spice's properties.

7.2 Clinical Research on *Aframomum melegueta*

Clinical research involves studying the effects of Guinea pepper on human health and well-being through controlled experiments and trials [72, 94]. While Guinea pepper has a history of traditional uses, clinical research is ongoing to validate these uses and explore potential therapeutic applications. Some areas of clinical research on *Aframomum melegueta*:

- **Anti-inflammatory Properties**: Studies aim to investigate the anti-inflammatory effects of Guinea pepper and its potential in managing conditions characterized by inflammation, such as arthritis.
- **Antioxidant Effects**: Clinical trials may assess the antioxidant properties of Guinea pepper and its ability to protect cells from oxidative damage. This research is relevant to overall health and may have implications for chronic diseases.
- **Digestive Health**: Guinea pepper's traditional use as a digestive aid is a subject of interest. Clinical studies may explore its effects on gastrointestinal health and its role in improving digestion.
- **Pain Management**: Research may investigate the analgesic properties of Guinea pepper and its potential for pain relief, especially in conditions associated with pain and discomfort.
- **Respiratory Health**: Clinical trials may explore the use of Guinea pepper or its extracts in respiratory health, particularly in managing conditions like coughs and congestion.

- **Antimicrobial Activity**: Guinea pepper's potential antimicrobial properties may be examined in clinical studies to assess its effectiveness against infections.
- **Aphrodisiac Effects**: Research may delve into the traditional use of Guinea pepper as an aphrodisiac, exploring its impact on libido and sexual health.
- **Safety and Dosage**: Clinical studies also aim to establish safe dosages and assess any potential side effects or contraindications associated with the use of Guinea pepper.

8 Some Herbal Products and Formulations of *Afromomum melegueta*

Aframomum melegueta has unique flavor profile that has led to its incorporation into various herbal products and formulations. Some examples of herbal products and formulations that may include *A. melegueta* are the following:

Spice Blends: Guinea pepper is a common ingredient in spice blends and seasoning mixtures. It adds depth and complexity to spice mixes used in various culinary applications. For example, it is a component of traditional spice blends like garam masala and curry powder.

Digestive Bitters: Some herbal digestive bitters and digestive aids may include *A. melegueta* among their ingredients. These formulations are designed to support healthy digestion and alleviate digestive discomfort.

Herbal Teas: Guinea pepper may be included in herbal tea blends, often in combination with other herbs and spices known for their digestive or warming properties. These teas are consumed for their flavor and potential digestive benefits.

Aphrodisiac Formulations: Due to its traditional reputation as an aphrodisiac, Guinea pepper may be incorporated into herbal formulations designed to enhance libido and sexual vitality. These products may be marketed as dietary supplements or natural aphrodisiacs.

Aromatherapy Blends: The essential oil derived from *A. melegueta* may be used in aromatherapy blends for its unique aroma. It can be diffused or added to massage oils for its aromatic properties.

Traditional Medicine: In some traditional healing systems, *A. melegueta* is used in herbal formulations to address various health concerns, such as digestive discomfort, joint pain, or respiratory issues.

Flavoring for Alcoholic Beverages: Guinea pepper is sometimes used to flavor alcoholic beverages, particularly craft beers and gins. It contributes to the complex and aromatic profiles of these drinks.

Nutraceuticals: *A. melegueta* extracts or powders may be used as ingredients in nutraceutical products, such as dietary supplements or functional foods. These products may claim various health benefits attributed to the spice's bioactive compounds.

Culinary Oils and Vinegar: Some specialty oils and vinegar may be infused with Guinea pepper to impart their unique flavor and aroma to dressings, marinades, or cooking oils.

Herbal Liqueurs: In some regions, herbal liqueurs or aperitifs are made using Guinea pepper, among other botanicals. These beverages may have a spicy and aromatic character.

9 Toxic Compounds in *Afromomum melegueta*

Aframomum melegueta is generally considered safe for culinary use when consumed in moderation. However, like many spices and plants, it contains certain compounds that, in excessive amounts, can potentially have adverse effects on health [80]. Some of the compounds in Guinea pepper that may have toxic effects if consumed in large quantities are as follows:

Essential Oils: Guinea pepper is rich in essential oils, which contribute to its aroma and flavor. While these oils are generally safe for consumption, excessive consumption of essential oils, especially when not properly diluted, can lead to gastrointestinal discomfort, skin irritation, or allergic reactions in some individuals.

Alkaloids: Some alkaloids have been identified in Guinea pepper. In moderate amounts, alkaloids may have physiological effects, but excessive consumption can lead to toxicity. Common alkaloids found in plants include caffeine and nicotine.

Phenolic Compounds: While phenolic compounds are known for their antioxidant properties, excessive intake of phenolic-rich foods or supplements may lead to gastrointestinal irritation or other adverse effects in sensitive individuals.

Tannins: Guinea peppers may contain tannins, which are polyphenolic compounds. In large amounts, tannins can have an astringent effect and may interfere with the absorption of certain nutrients.

Spice Allergy: Some individuals may be allergic to specific spices, including Guinea pepper. Allergic reactions can range from mild skin irritation to severe respiratory symptoms. Individuals with spice allergies should avoid consuming Guinea pepper.

It is important to emphasize that the potentially toxic effects of these compounds are typically associated with excessive consumption or misuse. When used in culinary applications as a spice, Guinea pepper is considered safe for most people. However, as with any food or spice, moderation is key, and individual tolerance may vary. Additionally, it is essential to be cautious when using essential oils derived from Guinea pepper or any other plant. Essential oils are highly concentrated and should be used sparingly and appropriately diluted when used for aromatherapy, massage, or other applications.

10 Conclusion

Grains of Paradise is a spice with a rich history, diverse culinary uses, and potential medicinal properties. It is native to the rainforests of West Africa and has made its mark in cuisines around the world, adding complexity and depth to a wide range of dishes. Its unique flavor, reminiscent of citrus and pepper, has earned it a special place in the hearts of chefs and food enthusiasts. Beyond the culinary realm, Guinea pepper has deep cultural and traditional significance, serving as a medicinal herb, an aphrodisiac, and a protective charm in various cultures. Modern research is beginning to uncover its potential health benefits, including anti-inflammatory and antioxidant properties. As the global spice trade experiences a resurgence of interest in this unique spice, it is crucial to prioritize sustainable cultivation practices and fair-trade principles to ensure that the production of *A. melegueta* benefits local communities and ecosystems. In a world where culinary diversity is celebrated and the search for new flavors never ends, *A. melegueta* offers a tantalizing journey into the heart of West African cuisine and culture, reminding us of the rich tapestry of flavors and traditions that make our global culinary heritage so vibrant and exciting.

In conclusion, Guinea pepper is a spice with a rich history, diverse culinary uses, and potential medicinal properties. While not a significant source of macronutrients, it contains various bioactive compounds and phytochemicals that contribute to its flavor and potential health benefits. Its unique flavor profile, reminiscent of citrus and pepper, has earned it a special place in the world of culinary arts and traditional medicine. As global interest in this spice continues to grow, it is essential to prioritize sustainable cultivation practices and fair trade to ensure its long-term availability and benefit to local communities. *A. melegueta* has a growing presence in the global culinary and spice market. Its unique flavor, culinary versatility, and potential health benefits have contributed to its popularity. Opportunities abound for those interested in various aspects of the Guinea pepper supply chain, from cultivation and processing to distribution and culinary ventures. Sustainability and fair trade principles are also essential considerations for businesses in this industry.

Abstract

This chapter aims to discuss the phytomedicinal value of turkey berry (*Solanum torvum* Sw.). The shrub or small tree, turkey berry, is native to tropical and subtropical regions of Africa, Asia, and the Americas and has a long history of use in various culinary and traditional medicinal practices across different cultures. However, it is highly adaptable to different ecological niches, which allows it to grow in a variety of habitats, from coastal areas to highlands. The eggplant or tomato-like fruits of *S. torvum* have a unique aroma, sweet taste, and high phenolic contents that are essential to the dietary and medicinal properties of the plant. The plant is rich in vitamins, minerals, dietary fiber, protein, and secondary phytochemicals like flavonoids, alkaloids, tannins, saponins, essential oils, glycosides, and steroids. It is used to prepare curry and gravy dishes, stir-fries, pickles and chutneys, soups and stews, sauces and sambals, fried snacks, stuffed dishes, rice-based dishes, and other traditional dishes. The ethnobotanical values of *S. torvum* include rituals and symbolism, culinary traditions, economic uses, and traditional medicine. The plant is used to aid digestion as well as an anti-inflammatory, antioxidant, antimicrobial, immune modulation, cardiovascular health maintenance, wound healing, antidiabetic, weight management, and fever reduction. Clinical research on turkey berry is ongoing, and there is still much to learn and explore regarding the potential health benefits and therapeutic applications of the plant. Some herbal products containing turkey berry include herbal teas, herbal powders, herbal tinctures and extracts, capsules, herbal blends, and infusions. Turkey berry is generally considered safe for consumption when used in moderation as a food or traditional herbal remedy. However, like many botanicals, excessive or improper use can potentially lead to adverse effects.

1 Introduction

Turkey berry (*Solanum torvum* Sw.), also known as wild eggplant, devil's fig, or pea eggplant, Sundakkai in Tamil Nadu, India, Makheua Phuang in Thai, and Izote in Mexico, is a plant that belongs to the Solanaceae family, which includes other well-known members such as tomatoes, potatoes, and bell peppers [5, 42]. This plant is native to tropical and subtropical regions of Africa, Asia, and the Americas. Turkey berry has a long history of use in various culinary and traditional medicinal practices across different cultures [3, 25, 68].

Understanding the botanical characteristics of turkey berry is essential for recognizing, cultivating, utilizing, and conserving the plant. Turkey berry is a perennial plant that can grow as a shrub or small tree, typically reaching heights of 1 to 3 m (3 to 10 ft). It features woody stems and branches with numerous leaves and fruit clusters [25]. The leaves of turkey berry are simple, alternate, and dark green. They are generally elliptical or ovate, with a slightly serrated margin [66]. The flowers of *S. torvum* grow in clusters on the plant and are typically small, star-shaped, and white to pale lavender. The fruit of turkey berry is a small, round, or oval berry, about 1–2 cm (0.4–0.8 in.) in diameter [110]. When mature, the fruits turn from green to yellow or orange and contain numerous seeds. The fruit resembles miniature eggplants or tomatoes. They have a unique aroma, sweet taste, and high phenolic contents that are essential to the dietary and medicinal properties of the plant [126]. It is worth noting that different cultivars of turkey berry exist with variations in fruit size and color. Some have green or white fruits, while others have red or purple ones. The plant is well adapted to tropical and subtropical climates and can thrive in a variety of soil types, including sandy, loamy, and clay soils [116]. It is often found in disturbed habitats, such as roadsides and fallow fields, and it often grows as a weed in agricultural fields [64, 130].

Turkey berry is a widely distributed plant, with native populations found in various regions around the world. In Africa, turkey berry is native to several African countries, including Nigeria, Ghana, Cameroon, Madagascar, and other tropical and subtropical regions across the continent [57, 132]. In Asia, *S. torvum* is prevalent in countries such as India, Sri Lanka, Malaysia, Thailand, and Indonesia. Turkey berry has also been reported in the Americas, particularly in tropical regions of the Caribbean, Central America, and South America [8, 42]. Due to its adaptability and hardiness, turkey berry has become naturalized in many other parts of the world, including parts of the United States, Australia, and various Pacific islands [46].

Turkey berry has a rich history of ethnobotanical uses in traditional medicine and culinary traditions across different cultures. Its diverse applications include:

Culinary Uses: Jena et al. [63] reported that turkey berry is commonly used in cooking various culinary dishes, particularly in Asian (South Indian) and African cuisines. It is added to soups, stews, curries, and stir-fries. The bitter and slightly tangy taste of turkey berry adds a unique flavor dimension to dishes. It is often used to balance the flavors of other ingredients.

Traditional Medicine: This includes

- Digestive Aid: In traditional medicine, turkey berry is used to aid digestion and alleviate gastrointestinal discomfort [19].
- Anti-inflammatory and Antioxidant: Some cultures use turkey berry as a natural remedy for inflammatory conditions and the plant's antioxidant properties have led to its use as a remedy for various health issues [25, 86].
- Fever Reduction: In some regions, turkey berry is employed to help reduce fever and symptoms of illnesses [5].

Pest Control: The leaves and fruits of turkey berry contain compounds that can act as natural insect repellents [33, 66]. For this role, they are sometimes placed in storage containers to protect grains and pulses from pests [94–96, 100].

Livestock Feed: In some areas, turkey berry leaves and fruits are used as supplemental fodder for livestock [12, 38, 90, 104].

This chapter aims to discuss the phytomedicinal value of turkey berry. It will present the origin, distribution, and botany of *S. torvum* wherein it is shown that the widespread distribution of the plant has led to its incorporation into a variety of culinary and medicinal traditions. This includes culinary and traditional medicine uses. The next sections address the nutritional and phytochemical properties as well as the food uses of turkey berry. Turkey berry is a versatile ingredient in many cuisines. It is used in curries, soups, stews, and stir-fries. Its slightly bitter and tangy flavor adds depth to dishes. Turkey berry has a history of use in traditional medicine across its distribution areas. Other parts of the chapter are on the ethnobotanical, pharmacognosy, and clinical works, herbal products, toxicity, and commercial values of turkey berry. It is believed to have various medicinal properties, including digestive, anti-inflammatory, and antimicrobial effects. The adaptability of turkey berry to various regions and environmental conditions has allowed them to become an integral part of diverse culinary traditions and traditional healing practices. The plant's versatility, from its multiple uses in regional cuisines to its potential health benefits, underscores its significance in global biodiversity and human culture.

2 Origin and Distribution of Turkey Berry (*Solanum torvum*)

The exact origin of *S. torvum* is unknown but researchers believe that the plant likely originated in tropical and subtropical regions of Africa, Asia, and South America where it can be found in the wild [48, 132]. In addition to being found in the wild in these regions, it has cultural and agricultural significance through a long history of cultivation and use in traditional cuisines and medicinal practices. Turkey berry is well-adapted to tropical and subtropical climates, where it thrives in warm and humid conditions. It is known for its ability to grow in a variety of soil types, including sandy, loamy, and clay soils, as long as there is good drainage. The plant can be found in disturbed habitats such as roadsides, fallow fields, and areas with disrupted vegetation. Turkey berry can be cultivated in gardens and farms, but it also grows as a wild plant in many regions. Turkey berry is commonly found in tropical and subtropical regions of Africa, Asia, the Americas, and other parts of the world. Its adaptability to different ecological niches allows it to grow in a variety of habitats, from coastal areas to highlands. Genetic studies have indicated high genetic diversity in *S. torvum* populations in Africa and Asia, reinforcing the idea of its long-term presence in these areas [134, 135]. Also, there have been archaeological findings of *S. torvum* seeds in ancient sites in Africa, Asia, and South America providing further evidence of its historical cultivation and consumption. Within these regions, turkey berry goes by a multitude of local names in different regions, reflecting its cultural significance and versatility in traditional dishes. Some of these names include Igbo or Oha (Igbo language) in Nigeria where it is a key ingredient in soups like Oha soup, Sundakkai and Bhatkatiya in Tamil and Hindi (India) where it is a popular addition to South Indian cuisine [10, 124]. It is called Makheua Phuang in Thailand and is used in various dishes, including curries and stir-fries. It is commonly called wild eggplant or bitter ball in the Caribbean and is used in traditional recipes. In Brazil, turkey berry is called Berinjela-do-mato and is used in many Brazilian local cuisines [79].

3 Distribution and Naturalized Regions of Turkey Berry (*Solanum torvum*)

Turkey berry has an extensive distribution that spans multiple continents and regions because it thrives in a variety of climates and habitats, making it a resilient and adaptable plant. Due to its adaptability and ability to grow in a wide range of conditions, turkey berry has become naturalized in various other regions around the world. Some examples include the United States (found in states like Florida and Hawaii, where it grows as a weed), Australia, and the Pacific Islands [47, 50]. Turkey berry exhibits adaptability to diverse habitats and climatic conditions, which contributes to its widespread distribution. It can thrive in:

(a) **Africa:**

West Africa: Turkey berry is native to several West African countries, including Nigeria, Ghana, Cameroon, and Ivory Coast. It is a staple in many West African cuisines, where it is used in dishes such as soups and stews [49, 99].

East Africa: The plant is also found in East African countries like Kenya, Tanzania, and Uganda, where it is used both in cooking and traditional medicine.

Southern Africa: Turkey berry is present in Southern African countries like Zambia and Zimbabwe, where it is known by various local names.

(b) **Asia:**

India: Turkey berry is widely cultivated and consumed in India, where it is a common ingredient in various regional cuisines.

Southeast Asia: In countries like Thailand, Malaysia, and Indonesia, turkey berry is used in curries, stir-fries, and traditional dishes.

Sri Lanka: Known as Waran, it is a popular vegetable in Sri Lankan cuisine.

Philippines: In the Philippines, it is called tabatsoy and is used in local dishes.

China: Turkey berry is found in parts of southern China.

(c) **Americas:**

Caribbean: Turkey berry is native to the Caribbean region, where it is used in local dishes and traditional remedies. It is known as a wild eggplant in some Caribbean countries.

Central America: In countries like Costa Rica and Nicaragua, it is called berenjena cimarrona and is used in traditional dishes.

South America: Turkey berry is present in South American countries such as Brazil, Colombia, and Venezuela, where it is known as berenjena cimarrona or jilo.

(d) **Tropical and Subtropical Regions**: Turkey berry prefers warm and humid tropical and subtropical climates, making it well-suited for regions with consistent temperatures and rainfall [34, 125].

The distribution and naturalization of Turkey berry in these regions is connected to

– **Various Soil Types**: The plant can grow in a variety of soil types, including sandy, loamy, and clay soils, as long as there is good drainage.
– **Disturbed Habitats**: It often thrives in disturbed habitats, such as roadsides, fallow fields, and areas with disrupted vegetation.

– **Cultivated Settings**: While it can grow as a wild plant, turkey berry is also cultivated in gardens and farms in many regions for its culinary and medicinal uses.

4 Botany and Cultivation of Turkey Berry (*Solanum torvum*)

Solanum torvum is a perennial plant that can grow as either a shrub or a small tree. Its growth habit depends on environmental conditions and cultivation practices [7, 121]. Depending on the growth conditions and regional variations, turkey berry plants can appear as compact shrubs with dense foliage or as small trees with a more open canopy. The plant's overall appearance can be bushy or somewhat spindly, with multiple branches and leaves (Fig. 1). The plant has a fibrous root system. The size of turkey berry plants can vary widely. They typically range from 1 to 3 m (3 to 10 ft) in height, but some individuals can grow taller under favorable conditions [120]. The plant features woody stems and branches. These stems are often green when young, turning brown or gray as they mature. Turkey berry has simple, alternate leaves that are dark green and slightly glossy. The leaves are typically elliptical or ovate with a slightly serrated margin [70]. The leaves are typically dark green, but leaf color can vary depending on factors like age and environmental conditions. The leaf blades are usually elliptical or ovate, with a smooth or slightly serrated margin. The leaves are generally smooth and slightly glossy [9, 51]. The leaves of turkey berry are simple, meaning they consist of a single leaf blade. They are arranged alternately along the stems. The flowers of *S. torvum* are small, star-shaped, and white to pale lavender. They are typically arranged in clusters or inflorescences [52]. Turkey berry produces small, star-shaped flowers that are typically white to pale lavender. The flowers are arranged in clusters or inflorescences at the tips of branches. These flowers are hermaphroditic, meaning they have both male and female reproductive structures within the same flower. The fruit of turkey berry is a small, round, or oval berry, typically measuring

Fig. 1 Leaves of turkey berry (*S. torvum*)

Fig. 2 Flowers and seeds of turkey berry (*S. torvum*)

about 1 to 2 cm (0.4 to 0.8 in.) in diameter [18, 80, 84]. When ripe, the fruit changes from green to yellow or orange and contains numerous small seeds (Fig. 2). The fruit bears a resemblance to miniature eggplants or tomatoes. The fruit of *S. torvum* is a small berry that starts green and matures to yellow or orange. When the fruit is ripe, it is typically 1 to 2 cm (0.4 to 0.8 in.) in diameter. Each fruit contains numerous tiny seeds [61, 74]. The fruit has a slightly bitter and tangy taste, which contributes to its culinary and culinary appeal. It is worth noting that *S. torvum* variants and cultivars exist with differences in fruit size, color, and taste, depending on the region and local preferences. These features are linked to factors such as soil type, climate, and regional genetic variations [59, 133]. These characteristics contribute to the plant's adaptability and versatility in different environments and culinary traditions.

Cultivating turkey berry can be a rewarding endeavor due to the increasing culinary and medical application of the crop. It is also not challenging because the crop is highly versatile [76, 105]. Turkey berry is well-suited to tropical and subtropical climates, and it can thrive in a variety of soil types. It thrives in warm and humid tropical and subtropical climates but prefers temperatures between 25 °C and 35 °C (77 °F to 95 °F) and cannot tolerate frost. The planting location must also receive plenty of sunlight, as turkey berry requires full sun for optimal growth [118]. Turkey berry can grow in various soil types, but it prefers well-drained soil with a pH level between 6.0 and 7.5 [122]. Soil fertility may also be improved by adding organic matter, such as compost or well-rotted manure, to enhance nutrient availability [106]. Turkey berry can be grown from seeds or propagated from stem cuttings. If planting from seeds, soak the seeds in water for 24 h before planting to improve germination rates. Sow the seeds directly into the prepared soil, spacing them about 1 to 2 ft apart in rows or a well-prepared garden bed [117].

Water the seeds or cuttings thoroughly after planting. Turkey berry requires consistent moisture for optimal growth. Keep the soil evenly moist but not waterlogged. Water deeply when the soil surface begins to dry and ensure good drainage to prevent waterlogging, which can lead to root rot. Applying a layer of mulch around the base of the plants helps retain moisture, suppress weeds, and regulate soil temperature [129]. Organic mulch like straw or compost is ideal. Turkey berry benefits from regular fertilization with balanced, slow-release fertilizers [123, 127]. Farmers can use a general-purpose fertilizer or one specifically formulated for vegetables. Follow the recommended dosage on the fertilizer label and avoid over-fertilizing, as excessive nitrogen can result in excessive vegetative growth at the expense of fruit production. Pruning can help manage the growth of turkey berry plants and encourage better fruit production. Pinch back the growing tips of young plants to encourage bushier growth [30, 31]. Provide support or trellises for the plants, especially if they are grown as tall shrubs or small trees, to prevent sprawling and improve air circulation. Turkey berry is relatively resistant to pests and diseases, but occasional issues may arise. Monitor your plants regularly and take appropriate measures if pests or diseases are detected [32, 62]. Common pests of turkey berry include aphids, whiteflies, and fruit flies. Use organic pest control methods or insecticidal soap if necessary. Inspect the plants regularly for signs of diseases like powdery mildew or leaf spot, and treat promptly with appropriate fungicides if needed [20, 58]. Turkey berry typically begins to produce fruits within a few months after planting [119, 128]. Harvest the fruits when they are firm, green, and about 1 to 2 cm (0.4 to 0.8 in.) in diameter. Ripe fruits turn yellow or orange but should be harvested before they become too ripe to maintain optimal flavor. Harvesting regularly encourages continued fruit production. It is a versatile and flavorful addition to many culinary dishes, and its adaptability to various soil types and climates makes it an attractive option for home gardeners and farmers in tropical and subtropical regions.

The diversity of *S. torvum* encompasses a range of aspects, including its botanical characteristics, cultivars, regional variations, and uses in different cultures [1]. This diversity highlights the plant's adaptability and versatility in various environments and its rich history of culinary and medicinal applications.

Botanical Diversity of *Solanum torvum*:

- Varieties: *Solanum torvum* variants and cultivars have differences in fruit size, color, and taste. These variations are found in different regions and have led to local preferences for specific types [6, 29].
- Plant Morphology: The size and shape of turkey berry plants can vary. They can grow as small shrubs or small trees, depending on environmental conditions and local cultivation practices.

Regional Diversity of *Solanum torvum*:

- Culinary Uses: Turkey berry is used differently in various culinary traditions around the world. It is incorporated into diverse dishes, including soups, stews, curries, and stir-fries, each with its unique flavors and cooking methods.
- Local Names: Turkey berry is known by numerous local names in different regions, reflecting its cultural significance. For example, it is called Sundakkai in Tamil Nadu, India, Makheua Phuang in Thailand, and njama njama in Cameroon. These names emphasize its role in local cuisines.
- Traditional Medicine: The uses of turkey berry in traditional medicine also vary by region. Different cultures have developed remedies based on their

understanding of the plant's properties, resulting in diverse applications for ailments ranging from digestive issues to inflammation [87].

Culinary Diversity of *Solanum torvum*:

- Preparation Methods: The culinary diversity of turkey berry is evident in various ways it is prepared. It can be fried, roasted, boiled, or used fresh, depending on the dish and cultural practices.
- Complementary Ingredients: The choice of ingredients that accompany turkey berry varies by region. Some cultures pair it with spices, coconut, or other vegetables to create unique flavor profiles.
- Dish Types: Turkey berry is used in a wide array of dishes, such as Indian sambar, Thai green curry, Filipino pinakbet, and Ghanaian kontomire stew. The plant's adaptability to different cuisines underscores its versatility.

Variability in Traditional Medicine:

- Remedial Practices: Traditional medicinal uses of turkey berry are diverse and can include treatments for digestive problems, fever, inflammation, and more. Local herbalists and healers may have distinct methods of preparation and application.
- Preparation Techniques: The methods for preparing turkey berry-based remedies can vary, such as infusions, decoctions, poultices, or direct application of crushed leaves or fruits.

Environmental Adaptability:

- Habitat Range: Turkey berry exhibits adaptability to various ecological niches. It can thrive in tropical and subtropical regions, ranging from coastal areas to highlands, and in different soil types [22].
- Cultivation Practices: Depending on local agricultural practices, turkey berry may be cultivated in gardens, farms, or allowed to grow naturally in fields and disturbed habitats. Its adaptability makes it suitable for both subsistence and commercial cultivation.

Nutritional Diversity of *Solanum torvum*:

- Nutrient Content: The nutritional composition of turkey berry can vary based on factors like soil quality, cultivation methods, and maturity at harvest. Variations in vitamins, minerals, and phytochemicals are observed [14].
- Dietary Significance: Turkey berry provides essential nutrients and dietary fiber, contributing to the nutritional diversity of diets in regions where it is consumed regularly.

Medicinal Versatility of *Solanum torvum*:

- Health Conditions: The potential health benefits of turkey berry are diverse, including antioxidant, anti-inflammatory, and digestive properties. Different cultures may emphasize specific health aspects based on their traditional knowledge.

- Application Methods: Traditional healers and practitioners may employ various parts of the plant, including leaves, fruits, or roots, for medicinal purposes, leading to a diverse range of applications.

Variability in Preparation and Presentation:
- Culinary Creativity: The culinary diversity of turkey berry is marked by the creativity in its preparation. It can be a prominent ingredient or a complementary one, lending unique flavors and textures to dishes.
- Regional Specialties: Specific dishes featuring turkey berry become regional specialties, celebrated for their unique taste and cultural significance.

5 Nutritional Properties and Food Uses of Turkey Berry (*Solanum torvum*)

Turkey berry is not only valued for its culinary and medicinal uses but also for its nutritional content. It is important to note that turkey berry has a slightly bitter and tangy taste, which can be an acquired taste for some. Its culinary use varies by region, and it is prized for its ability to add depth of flavor to dishes [2, 4, 91–93]. Turkey berry is not only valued for its culinary and medicinal uses but also for its nutritional content [11]. While the nutrient composition can vary depending on factors such as maturity and cultivation methods, these are some key nutritional properties:

1. **Vitamins:** Turkey berry is a source of various vitamins, including vitamin C, vitamin A, and vitamin B-complex vitamins like niacin and riboflavin.
2. **Minerals:** It contains essential minerals such as potassium, calcium, and iron, which are important for maintaining overall health.
3. **Dietary Fiber:** Turkey berry is a good source of dietary fiber, which aids in digestion and supports gastrointestinal health [60].
4. **Protein:** While not a primary source of protein, turkey berry contains a moderate amount, making it a valuable addition to vegetarian diets.
5. **Secondary Phytochemicals:** The plant is rich in phytochemicals, including flavonoids, alkaloids, and phenolic compounds, which contribute to its potential health benefits [13].

Solanum torvum is widely used in culinary traditions across different cultures. It is appreciated for its unique flavor and versatility in a variety of dishes. Some common food uses of turkey berry include:

1. **Curry and Gravy Dishes:** Turkey berry is a popular ingredient in many curry and gravy dishes, particularly in South Asian and Southeast Asian cuisines. It adds a slightly bitter and tangy flavor to the dishes, complementing the richness of the sauce.

2. **Stir-Fries:** In stir-fry dishes, turkey berry is often used alongside other vegetables and protein sources. Its firm texture holds up well to stir-frying, and it adds a distinct taste to the overall dish.
3. **Pickles and Chutneys:** In some regions, turkey berry is used to prepare pickles and chutneys. The berries are typically marinated with spices, oil, and other seasonings. These pickles and chutneys can be served as condiments or side dishes.
4. **Soups and Stews:** Turkey berry can be added to soups and stews for extra flavor and nutrition. It is often used in traditional dishes like sambar (a South Indian lentil stew) and sinigang (a Filipino sour soup).
5. **Sauces and Sambals:** Turkey berry is sometimes included in sauces and sambals (spicy condiments) to enhance their flavor profiles. It can be used in combination with other ingredients like chilies, garlic, and herbs.
6. **Fried Snacks:** In some cultures, turkey berry is coated in batter and deep-fried to make crispy snacks. The fried turkey berries are enjoyed for their crunchy texture and savory taste.
7. **Stuffed Dishes:** Turkey berry can be stuffed with various fillings, such as spices, ground meat, or lentils, and then cooked. Stuffed turkey berries are common in Indian cuisine and other regional cuisines.
8. **Rice and Rice Dishes:** In certain dishes, turkey berry is added to rice during cooking to infuse its flavor into the grains. It is also used in rice-based dishes like biryani and pilaf.
9. **Traditional Dishes:** Turkey berry is a key ingredient in traditional dishes like njama njama in Ghana, Terong Belanda in Indonesia, and Koottu in South India. These dishes are celebrated for their unique combination of flavors.
10. **Medicinal Preparations:** While not a food use, turkey berry is sometimes used in medicinal preparations, including herbal teas and infusions.

6 Phytochemical Constituents and Potential Health Benefits of Turkey Berry (*Solanum torvum*)

Turkey berry (*S. torvum*) contains a variety of phytochemical constituents, which are natural compounds found in plants. These phytochemicals contribute to the plant's flavor, aroma, and potential health benefits. Some of the notable phytochemical constituents found in turkey berry include:

1. **Alkaloids:** Alkaloids are naturally occurring organic compounds that often have physiological effects on humans and animals [97, 103]. Turkey berry contains various alkaloids, including solanidine and solasonine. Alkaloids may have diverse effects, ranging from antimicrobial to anti-inflammatory properties [15, 101].
2. **Flavonoids:** Flavonoids are a group of polyphenolic compounds found in many fruits and vegetables, including turkey berry. These compounds are known for

their antioxidant properties and potential health benefits, such as reducing oxidative stress and inflammation.

3. **Glycosides:** Glycosides are compounds composed of a sugar molecule (glycone) and a non-sugar moiety (aglycone). Turkey berry contains various glycosides, which can have different biological activities. Some glycosides may play a role in the plant's medicinal properties [23].
4. **Tannins:** Tannins are polyphenolic compounds found in turkey berry and other plants. They can contribute to the astringent taste of certain fruits and are often used in traditional medicine. Tannins have antioxidant properties and may have applications in wound healing and digestive health [35].
5. **Phenolic Compounds:** Phenolic compounds, including phenolic acids and phenolic glycosides, are present in turkey berry [36, 102]. These compounds are known for their antioxidant and anti-inflammatory activities. They may contribute to the potential health benefits of the plant.
6. **Steroids and Triterpenoids:** Turkey berry contains steroidal compounds and triterpenoids. These compounds are part of the plant's chemical makeup. Some steroidal compounds may have anti-inflammatory properties [28, 75].
7. **Saponins:** Saponins are glycosides with a characteristic foaming property. They are found in various plant species, including turkey berry. Saponins may have immune-modulating and cholesterol-lowering effects [21, 78].
8. **Essential Oils:** Some varieties of turkey berry may contain essential oils, which are volatile aromatic compounds responsible for the plant's fragrance. These oils can vary in composition and may contribute to the plant's flavor.

It is important to note that the phytochemical composition of turkey berry can vary depending on factors such as plant variety, growing conditions, and maturity at harvest [37]. While these phytochemicals contribute to the plant's potential health benefits, further research is needed to better understand their specific effects and mechanisms of action. Additionally, the presence of these compounds in turkey berry has made it a subject of interest in both traditional and modern herbal medicines, as well as in culinary applications. The consumption of turkey berry has been associated with several potential health benefits, although further research is needed to fully understand its mechanisms and efficacy. Some of these benefits include:

1. **Antioxidant Properties:** The presence of phytochemicals in turkey berry gives it the typical antioxidant properties, which can help combat oxidative stress and reduce the risk of chronic diseases.
2. **Anti-inflammatory Effects:** Turkey berry may possess anti-inflammatory properties, which could be beneficial for individuals dealing with inflammatory conditions.
3. **Digestive Health:** Traditionally, turkey berry has been used to support digestive health and alleviate gastrointestinal discomfort [53].
4. **Antimicrobial Activity:** Some studies suggest that turkey berry may have antimicrobial properties, which can help protect against various infections [39].

5. **Antidiabetic Potential:** Preliminary research indicates that turkey berry may play a role in blood sugar regulation and could be explored as an adjunct in diabetes management.
6. **Weight Management:** The dietary fiber in turkey berry can contribute to feelings of fullness, potentially aiding in weight management.
7. **Nutrient Boost:** Incorporating turkey berry into the diet can provide essential vitamins and minerals that support overall health [77].

7 Ethnobotanical Value of Turkey Berry (*Solanum torvum*)

The ethnobotany of turkey berry (*S. torvum*) reveals its rich history of traditional uses across various cultures and regions. It underscores the multifaceted role of the plant in various cultures and regions. From culinary traditions to traditional medicine and cultural symbolism, this plant has a long history of diverse uses. Its adaptability and versatility make it an integral part of many culinary and healing traditions, contributing to its enduring importance in the ethnobotanical landscape.

This versatile plant has been valued for centuries for its culinary, medicinal, and cultural significance.

Rituals and Symbolism: In certain cultures, turkey berry holds symbolic significance and is used in rituals, ceremonies, and offerings. It may be included in traditional healing rituals or as a protective charm.

Culinary Traditions: Turkey berry is a staple ingredient in many traditional dishes and contributes to the cultural identity of the cuisine in which it is used [54].

Economic Uses: Turkey berry is cultivated and harvested for both domestic consumption and commercial purposes, contributing to the livelihoods of farmers and local economies in regions where it is grown [16, 56, 95].

Traditional Medicine: Turkey berry has a long history of medicinal uses in traditional herbal medicine systems across different cultures and regions. While scientific research is ongoing to validate some of these traditional uses, some of the common medicinal uses attributed to turkey berry include:

- **Digestive Health**: This is one of the most widely recognized traditional uses of turkey berry is its role in promoting digestive health. It is believed to have mild laxative properties and is used to alleviate constipation and improve bowel regularity. Turkey berry is also used to relieve indigestion, bloating, and gas [55].
- **Anti-inflammatory Properties**: In traditional medicine, turkey berry is used to reduce inflammation and alleviate pain associated with conditions like arthritis and joint pain. Poultices made from crushed leaves or heated leaves are sometimes applied topically to reduce inflammation.
- **Antipyretic (Fever-Reducing) Effects**: In some cultures, turkey berry is used to lower fever and manage symptoms of fever-related illnesses. It is believed to have antipyretic properties that help reduce body temperature during fever [17, 131].

- **Diuretic and Kidney Health**: Turkey berry has diuretic properties and is used in some regions to promote urination and support kidney health. It is believed to help in the elimination of toxins and excess fluids from the body [88].
- **Wound Healing**: In certain traditional medicine systems, turkey berry is used topically as a poultice or ointment to promote wound healing. It is believed to have antimicrobial properties that may help prevent infection.
- **Respiratory Health**: Some traditional remedies include turkey berry for managing respiratory conditions such as coughs and colds. It is believed to have properties that can help alleviate symptoms of respiratory ailments [45].
- **Antioxidant Effects**: Turkey berry contains antioxidants, including flavonoids and polyphenols, which may help combat oxidative stress and reduce the risk of chronic diseases. These antioxidants are thought to play a role in overall health and wellness.
- **Potential Antidiabetic Effects**: Preliminary studies have suggested that turkey berry may have potential antidiabetic effects. Some research indicates that it may help lower blood sugar levels, making it of interest in the management of diabetes.

It is important to note that while turkey berry has a history of traditional medicinal use, scientific research is ongoing to better understand its active compounds and their potential therapeutic benefits [40]. As with any herbal remedy, it is advisable to consult with a healthcare professional before using turkey berry or its extracts for medicinal purposes, especially if you have underlying health conditions or are taking other medications. Additionally, the quality and safety of herbal preparations can vary, so it is essential to use them with caution and under appropriate guidance.

8 Pharmacognosy and Clinical Research on Turkey Berry (*Solanum torvum*)

One way by which modern scientific research is exploring the potential health benefits of turkey berry and its bioactive compounds for better understanding and to lead to new applications and products is pharmacognosy and clinical research trials. Pharmacognosy is the study of natural products obtained from plants and their applications in medicine. *S. torvum* has been a subject of interest in pharmacognosy due to its traditional medicinal uses and the presence of various phytochemical constituents. Pharmacognostic works on turkey berry typically involve one of the following as outlined in Nurit-Silva et al. [89]:

1. **Morphological Identification:** Pharmacognosy begins with the accurate identification and authentication of the plant material. In the case of turkey berry, this involves recognizing its distinct morphological characteristics, including the growth habit, leaves, flowers, and fruits.
2. **Phytochemical Analysis:** Pharmacognostic studies of turkey berry involve the analysis of its phytochemical constituents. This includes identifying and

quantifying alkaloids, flavonoids, glycosides, tannins, phenolic compounds, steroids, triterpenoids, saponins, and other secondary metabolites present in the plant. Various analytical techniques, such as chromatography and spectroscopy, may be employed to determine the composition of phytochemicals.

3. **Quality Control:** Pharmacognosy plays a vital role in the quality control and standardization of herbal medicines and dietary supplements containing turkey berry extracts. Establishing quality parameters ensures the consistency and safety of herbal products.
4. **Medicinal Uses:** Pharmacognostic studies provide insights into the traditional medicinal uses of turkey berry. This includes documenting its historical applications in treating digestive disorders, inflammatory conditions, fever, and more. The identification of specific bioactive compounds helps understand the plant's pharmacological properties.
5. **Pharmacological Studies:** Pharmacognosy contributes to the exploration of turkey berry's pharmacological activities. Researchers investigate its potential as an anti-inflammatory, antioxidant, analgesic, diuretic, and more. Animal and in vitro studies are conducted to evaluate the plant's bioactivity.
6. **Formulation Development:** Turkey berry may be incorporated into various herbal formulations, traditional medicines, or dietary supplements. Pharmacognostic data assist in selecting the appropriate parts of the plant, extracting methods, and dosage forms for formulation.
7. **Toxicological Studies:** Assessing the safety of turkey berry is an essential aspect of pharmacognosy. Toxicological studies help determine the plant's potential adverse effects and safe usage levels.
8. **Standardization and Regulation:** Pharmacognostic data contribute to the development of monographs and standards for turkey berry in pharmacopeias and regulatory frameworks.
   – Standardization ensures the consistency and quality of herbal products containing turkey berry.
9. **Future Research:** Ongoing pharmacognostic research may uncover new phytochemical constituents and potential medicinal uses of turkey berry. Modern pharmacological and clinical studies can validate its traditional applications and explore new therapeutic avenues.

Clinical research on *S. torvum* is ongoing, and while there is still much to learn, several studies have explored its potential health benefits and therapeutic applications. Some areas of clinical research related to turkey berry include:

1. **Antioxidant and Anti-inflammatory Properties**: Some studies have investigated the antioxidant and anti-inflammatory effects of turkey berry. Antioxidants can help protect cells from oxidative stress, while anti-inflammatory properties may have implications for conditions like arthritis [65].
2. **Antidiabetic Effects**: Research has examined the potential antidiabetic properties of turkey berry. It has been suggested that it may help lower blood sugar levels, making it of interest in diabetes management [107].

3. **Gastrointestinal Health**: Turkey berry's traditional use as a digestive aid has prompted studies to assess its effects on gastrointestinal health. Research has explored its potential role in alleviating indigestion, promoting regular bowel movements, and reducing symptoms of gastrointestinal disorders [67].
4. **Antimicrobial Activity**: Some studies have investigated the antimicrobial properties of turkey berry. It has been tested against various bacteria and fungi, suggesting potential applications in controlling microbial infections [24, 26].
5. **Hepatoprotective Effects**: Turkey berry has been studied for its hepatoprotective effects, indicating its potential to protect the liver from damage caused by toxins or certain diseases [69].
6. **Wound Healing**: Research has explored the wound-healing properties of turkey berry. It has been tested in both animal and clinical studies to assess its potential to promote the healing of wounds and injuries [41].
7. **Immune Modulation**: Some studies have looked at the immunomodulatory effects of turkey berry [27, 111]. This research aims to understand its impact on the immune system and its potential applications in immune-related conditions [43].
8. **Anticancer Properties**: Preliminary studies have investigated turkey berry's potential anticancer properties, particularly its effects on cancer cell proliferation and apoptosis (cell death). However, more research is needed in this area [108].
9. **Cardiovascular Health**: Research has explored the effects of turkey berry on cardiovascular health markers, such as blood pressure and lipid profiles. These studies aim to determine its potential role in heart health [71].
10. **Toxicological Studies**: Clinical research includes safety and toxicity assessments to evaluate the potential adverse effects of turkey berry and to establish safe usage levels [44, 109].

These studies provide valuable insights into the potential health benefits of turkey berry, more research is needed to confirm and fully understand its therapeutic applications [112]. Additionally, the results of clinical studies can vary, and individual responses to herbal remedies may differ. As a result, it is advisable to consult with a healthcare professional before using turkey berry or its extracts for medicinal purposes, especially if you have underlying health conditions or are taking other medications.

9 Herbal Products of Turkey Berry (*Solanum torvum*)

Turkey berry is utilized in various herbal products and traditional preparations across different cultures. Its diverse phytochemical composition and potential health benefits have made it a valuable ingredient in herbal remedies and dietary supplements. Some herbal products and traditional preparations that incorporate turkey berry:

- **Herbal Teas:** Turkey berry leaves and fruits can be dried and used to prepare herbal teas. These teas are often consumed for their potential digestive and antioxidant properties [113].

- **Herbal Powders:** Dried and powdered turkey berry can be used as a dietary supplement. It is available in capsule or powder form and is sometimes marketed for its potential health benefits [113].
- **Tinctures and Extracts:** Turkey berry extracts, in the form of tinctures or liquid extracts, may be used as herbal remedies. These concentrated forms allow for easy dosage and administration.
- **Traditional Remedies:** In traditional medicine systems, turkey berry is used in various herbal remedies for digestive disorders, fever, inflammation, and other ailments. For example, in some regions of Africa, it is used in concoctions and infusions to treat stomachaches and indigestion.
- **Culinary Herbs and Spices:** Turkey berry is a popular culinary herb in some regions. It is used to add flavor to various dishes, particularly in South Indian and Southeast Asian cuisines. It is often used in curries, stews, and stir-fries to impart a slightly bitter and tangy taste.
- **Herbal Ointments and Topical Preparations:** Turkey berry leaves may be used in the preparation of herbal ointments or poultices for topical applications. They are believed to have anti-inflammatory and wound-healing properties.
- **Herbal Capsules and Tablets:** Some herbal supplement manufacturers offer turkey berry capsules and tablets as part of their product line. These products are often marketed for their potential health benefits.
- **Herbal Blends:** Turkey berry may be combined with other herbs and botanicals to create specialized herbal blends targeting specific health concerns, such as digestive health or immune support.
- **Herbal Infusions:** Turkey berry leaves and fruits can be steeped in hot water to make herbal infusions. These infusions are often consumed for their potential medicinal properties and pleasant flavor.
- **Traditional Tonics:** In some cultures, turkey berry is used as an ingredient in traditional health tonics or elixirs believed to boost overall wellness [73, 80].

Turkey berry is a part of various herbal products and traditional preparations, but scientific research is ongoing to better understand their specific health benefits and mechanisms of action. Also, as with any herbal product, it is advisable to consult with a healthcare professional before using turkey berry or its extracts for medicinal purposes, especially if you have underlying health conditions or are taking other medications. Additionally, the quality and safety of herbal products can vary, so it is essential to choose reputable sources and products.

10 Toxicity of Turkey Berry (*Solanum torvum*)

Turkey berry is generally considered safe for consumption when used in moderation as a food or traditional herbal remedy [72]. However, like many botanicals, excessive or improper use can potentially lead to adverse effects. Some considerations regarding the toxicity and safety of turkey berry include:

Solanine Content: Turkey berry, like other plants in the Solanaceae family (nightshades), contains certain alkaloids, including solanine and solasonine. Solanine is known for its potential toxicity when consumed in large quantities. The solanine content in turkey berry can vary depending on factors such as the plant's age and maturity. To minimize the risk of solanine toxicity, it is advisable to cook turkey berry before consumption, as cooking can help reduce the alkaloid content. Overripe or unripe fruits may have higher solanine levels [82, 114].

Allergic Reactions: Some individuals may be allergic to certain compounds present in turkey berry. Allergic reactions, though rare, can include symptoms like skin rashes, itching, and gastrointestinal discomfort. If you have known allergies to plants in the Solanaceae family, exercise caution when trying turkey berry for the first time.

Gastrointestinal Effects: When consumed in large amounts, turkey berry may cause gastrointestinal upset, including nausea, vomiting, and diarrhea. This is more likely to occur with excessive intake [115].

Interaction with Medications: Turkey berry may interact with certain medications or medical conditions. For example, it may affect blood sugar levels, which could be problematic for individuals with diabetes. If you are taking medications or have underlying health conditions, it is important to consult with a healthcare professional before incorporating turkey berry into your diet or as a supplement.

Raw Consumption: As a precaution, it is recommended to avoid consuming raw turkey berry, especially if you are unsure about its ripeness. Cooking the berries can help neutralize potentially harmful compounds and improve their palatability.

Safe Dosage: There is no established standard dosage for turkey berry as an herbal remedy. If you plan to use it for medicinal purposes, start with small amounts and monitor your body's response. Avoid excessive or prolonged use.

Consultation with Healthcare Professionals: Before using turkey berry or any herbal remedy for medicinal purposes, consult with a qualified healthcare professional, especially if you have pre-existing health conditions, are pregnant or nursing, or are taking medications.

Although turkey berry is generally considered safe for culinary use and traditional herbal remedies when consumed in moderation, it is essential to exercise caution, especially when using it for therapeutic purposes. If any adverse effects or concerns about its safety arise it is recommended to seek medical advice promptly. Individuals with known allergies, sensitivities, or specific medical conditions should be particularly vigilant and consult healthcare professionals.

11 Commercial Value of Turkey Berry (*Solanum torvum*)

Solanum torvum holds commercial value in various ways, particularly in regions where it is cultivated and used for culinary and medicinal purposes. Some aspects of its commercial value include:

Culinary Use: Turkey berry is an integral part of the cuisine in many regions, particularly in South Asia, Southeast Asia, and Africa. It is used in a wide range of dishes, adding a unique flavor and texture to curries, stews, and stir-fries. In regions where it is in high demand, the sale of fresh turkey berries in local markets can contribute to the income of small-scale farmers.

Export and Trade: In countries where turkey berry is grown commercially, it may be exported to international markets to cater to the culinary preferences of immigrant populations and consumers interested in global cuisines. Turkey berries are sometimes dried and packaged for export.

Traditional Medicine: Turkey berry is used in traditional medicine systems in various cultures for its potential health benefits [84]. The sale of turkey berry-based herbal remedies and dietary supplements can contribute to the herbal products industry.

Herbal Products: Turkey berry is incorporated into herbal products, including capsules, tablets, herbal teas, and tinctures, which are sold in health food stores and online markets. These products are marketed for their potential digestive, antioxidant, and anti-inflammatory properties.

Agroforestry and Farming: Turkey berry cultivation can be part of agroforestry systems, contributing to diversified farming practices. It can be grown alongside other crops, providing additional income and resources to farmers [81].

Traditional Tonics and Elixirs: In some cultures, turkey berry is used as an ingredient in traditional health tonics and elixirs. These tonics are sold in local markets and may contribute to the livelihoods of traditional healers [83].

Pharmaceutical and Cosmetics Industry: Some phytochemicals found in turkey berry have potential applications in the pharmaceutical and cosmetics industries. Extracts or compounds from turkey berry may be used in the development of new products.

Sustainable Agriculture: Turkey berry cultivation can be part of sustainable agriculture practices, as it is a hardy plant that can thrive in various conditions. Its cultivation may contribute to soil fertility and crop rotation strategies [85].

Food Processing Industry: Processed turkey berry products, such as pickles and chutneys, are available in some markets and cater to consumer preferences for convenience.

Research and Development: Ongoing research on the phytochemicals and potential health benefits of turkey berry may lead to the development of new commercial products and applications.

The commercial value of turkey berry can vary by region and market demand. Additionally, the quality and safety of turkey berry products are essential considerations, especially in the herbal products and dietary supplement industries. Regulations and quality control measures play a role in ensuring the integrity of turkey berry-based products.

12 Conclusion

Solanum torvum is a versatile plant with a rich history of use in culinary and traditional medicinal practices. Its botanical characteristics, wide distribution, ethnobotanical uses, nutritional properties, potential health benefits, and culinary applications make it a valuable and intriguing plant. As interest in natural and traditional remedies continues to grow, turkey berry remains an important resource with the potential for further scientific exploration and utilization in modern healthcare and cuisine. Turkey berry (*S. torvum*) is a remarkable plant with a rich history of cultivation, culinary use, and traditional medicine across diverse cultures and regions. Its origin in tropical and subtropical regions of Africa and Asia has given rise to its widespread distribution and adaptability to different climates and habitats. Its versatility in culinary applications, potential health benefits, and cultural significance make it a valuable and intriguing plant that continues to thrive and contribute to various aspects of human life around the world. Understanding its origin and distribution provides insight into the global significance of this unique plant. The botany of turkey berry (*S. torvum*) encompasses its growth habit, leaves, flowers, fruits, and adaptability to various environments. Its simple, yet distinctive, botanical features make it easily recognizable, and its versatility in terms of growth conditions and culinary uses has contributed to its significance in different cultures around the world. Pharmacognosy plays a crucial role in the comprehensive study of turkey berry, encompassing its morphological identification, phytochemical analysis, medicinal uses, pharmacological properties, and quality control. This multidisciplinary approach contributes to the understanding and utilization of turkey berry in traditional and modern medicine.

Abstract

This chapter aims to discuss the cultural, medicinal, and dietary significance of *Garcinia kola* Heckel (Clusiaceae) from a sustainability standpoint. The small- to medium-sized evergreen tree is native to the dense humid tropical rainforest ecosystems of West and Central Africa and grows alongside other traditionally valued forest crops. Also known as bitter kola or kola, the plant is deeply rooted in the cultures and traditions of West and Central Africa and has played a significant role in the lives of indigenous communities for centuries by offering a rich tapestry of uses and cultural significance. It bears bitter-tasting kola seeds. These seeds, with their intense bitterness, have become iconic and emblematic of the region's cultural heritage. Some food uses of bitter kola include snacks, flavoring agents, preparation of traditional soup, beverage infusion, medicinal concoctions added to food, and condiments and seasoning. Some of the cultural significance of *G. kola* include as a symbol of hospitality, traditional rituals and ceremonies, traditional medicine, food, and flavoring (as seasoning), stimulant and energy boost, social and ceremonial uses (like weddings and religious gatherings), offering and prayers, cosmetic and skin care, trade and economic value, and cultural conservation. Bitter kola is renowned for its various medicinal properties, and it has been used in traditional African medicine for centuries. It contains garcinol which has shown promise in research for its anticancer effects as well as kolaviron which has therapeutic effects. Some medicinal uses and potential health benefits of bitter kola include antimicrobial properties, antioxidant activity, anti-inflammatory effects, hepatoprotective properties, antidiabetic, antimalarial activity, cardiovascular health, analgesic and anti-inflammatory effects, anticancer potential, digestive aid and gut health improvement, aphrodisiac, and weight loss and management. The use of *Garcinia kola* for health management is generally considered safe when consumed and used in moderation. However, like many natural products, bitter kola should be used with caution, and excessive consumption can lead to potential adverse effects due to the bitter taste and sensitivity, caffeine content, potential allergic reactions, gastrointestinal distress, interactions with medications, and liver distress from overconsumption. Some herbal formulations prepared based on traditional knowledge that contain bitter kola include bitter kola extracts or tinctures, capsules, supplements, traditional herbal remedies, chewing sticks (snacks), traditional drinks and tonics (bitters), and honey infusions. This chapter suggests the need to incorporate sustainable practices and further research into the phytomedicinal and traditional benefits of the plant.

1 Introduction

Garcinia kola Heckel, commonly known as bitter kola, is a tropical flowering plant from the plant family, Clusiaceae. It is native to West and Central Africa and is particularly found in countries like Nigeria, Cameroon, Ghana, and Cote d'Ivoire. Bitter kola is a small, evergreen tree that produces fruit pods containing seeds known as kola nuts or simply kola. The intensely bitter-tasting kola may not be to everyone's liking and consumption is often limited to small quantities or specific preparations. These seeds are revered for their cultural, medicinal, and dietary significance in the regions where they grow and beyond [81]. Other diverse uses are linked to the phytochemical constituents of the fruits and tree bark which include several bioactive compounds [67, 69, 70]. They may be incorporated into some food products because of their medicinal and cultural value but not used as a staple food source in most diets within the native range of the crop [47]. Instead, bitter kola is valued for its role in traditional practices, customary events, festivities, and family celebrations as well as health benefits. Therefore, the tree is celebrated for its cultural, medicinal, and dietary significance in the regions where it grows. The seeds of *G. kola* are the most celebrated part of the plant and are commonly referred to as kola nuts. These seeds are known for their cultural significance, traditional uses, and potential medicinal properties [48]. Bitter kola seeds are used as a symbol of hospitality, a traditional remedy for various ailments, and an ingredient in traditional rituals and ceremonies [56]. Bitter kola holds a special place in the cultural and social traditions of many West and Central African communities. It is often used as a symbol of hospitality and is offered to guests as a sign of respect and welcome. In some cultures, presenting a kola nut during gatherings or ceremonies is a customary gesture.

The phytochemical compounds found in *G. kola* are not only beneficial for human health but also contribute to the defense mechanisms, ecophysiology, and adaptive capabilities of the plants, helping them ward off pests, diseases, and environmental stressors [95]. Bitter kola is rich in phytochemical constituents like flavonoids, polyphenols, alkaloids, saponins, tannins, terpenes, and many others, and these compounds have actual and potential health benefits against chronic diseases such as cancer, heart disease, and diabetes [71, 81]. Bitter kola is typically consumed in small quantities due to its intense bitterness. Its primary use is for its cultural and traditional significance, as well as its potential role in traditional medicine for various ailments [64, 80]. As such, bitter kola is not considered a significant dietary source of essential nutrients, but it may offer certain health benefits in the context of traditional medicine and folklore [65, 82]. However, scientific research on its specific nutritional content and health effects is limited, and further studies are needed to better understand its potential contributions to human health. Additionally, the ethnobotany of the bitter kola tree is a testament to the intricate relationship between people and plants in West and Central Africa [97–99, 114, 118]. The plant has deep roots in the traditions and folklore of West and Central Africa, which include:

Symbol of Hospitality: Bitter kola is considered a symbol of hospitality in many African cultures. It is often presented to guests as a gesture of respect and welcome. In some regions, offering a kola nut during social gatherings or ceremonies is a customary practice.

Traditional Medicine: Bitter kola has a rich history in traditional African medicine. It has been used for centuries to treat various ailments and is renowned for its medicinal properties [63, 106]. The seeds are believed to possess numerous health benefits, and they are used in various remedies.

Rituals and Ceremonies: Bitter kola is incorporated into various traditional rituals and ceremonies. The presence of kola is often associated with spiritual and cultural practices, including naming ceremonies, weddings, and religious rites.

Economic Value: The kola nut trade has economic significance in some regions, with bitter kola being an important commodity for trade and exchange [89–91]. Beyond its botanical characteristics, *G. kola* is culturally, medicinally, and economically significant. The seeds of the plant, known as kola nuts, have been used traditionally for various purposes, including:

Cultural and Social Traditions: Kola nuts are often presented as a symbol of hospitality and respect in many African cultures [62]. They are commonly offered to guests during social gatherings and ceremonies.

Traditional Medicine: Bitter kola has a rich history in traditional African medicine. It is believed to have various medicinal properties and has been used to treat ailments such as digestive issues, infections, and coughs [25]. Some people also associate it with aphrodisiac properties and improved energy levels [12].

Clearly, from its role as a symbol of hospitality to its use in traditional medicine, bitter kola weaves itself into the fabric of daily life and cultural practices. Its bitter taste is not just a flavor but a reflection of its deep-rooted significance. The use of bitter kola extends far beyond its nutritional value; it embodies a cultural identity, a source of livelihood, and a bridge between the physical and spiritual realms. As communities continue to cherish and celebrate bitter kola, they also recognize the importance of conserving this invaluable botanical treasure for future generations. In addition to its medicinal and cultural significance, bitter kola is consumed as a dietary supplement in some regions. The kola nuts are chewed or ground into a powder to make a paste that can be mixed with water or other beverages. Bitter kola is known for its intensely bitter taste, which is attributed to the presence of compounds like caffeine and theobromine [105].

G. kola, like many other rainforest plants, plays a significant role in its native ecosystem. It contributes to the ecological balance and provides essential services to the environment and wildlife [83]. The kola nut seeds are consumed by various animals in the rainforest, including rodents, primates, and birds. These animals aid in the dispersal of the seeds, helping the plant propagate and colonize new areas. Bitter kola contributes to the biodiversity of the rainforest by providing habitat and sustenance for a variety of wildlife species. It is part of the intricate web of life that characterizes these lush ecosystems. Some animals in the rainforest may also benefit from the medicinal properties of bitter kola. For instance, primates that consume the seeds may experience some of the plant's therapeutic effects [81]. While *Garcinia kola* thrives in its natural habitat, it faces several conservation challenges, primarily due to deforestation and habitat destruction in African rainforests. As human populations and economic activities expand, the rainforests are increasingly threatened by logging, agriculture, and urbanization. This poses a risk to the biodiversity and survival of plant species like bitter kola. Efforts are being made by conservation organizations and governments in African countries to address these challenges [92, 96, 115, 117]. These initiatives include promoting sustainable forestry practices, establishing protected areas, and raising awareness about the importance of preserving the rainforest ecosystem.

This chapter aims to discuss the cultural, medicinal, and dietary significance of *G. kola* from a sustainability standpoint. The chapter presents the origin, distribution, and botany of *G. kola* as well as the diverse food and traditional medicine uses. Other parts of the chapter focus on the ethnobotanical, pharmacognosy, and clinical works, herbal products, toxicity, and commercial values of *G. kola*. It is believed that bitter kola has various medicinal properties, including anti-inflammatory, antioxidant, anti-inflammatory, and antimicrobial effects [53]. *G. kola* is a crop with great potential for sustainable cultivation. The small- to medium-sized evergreen tree is native to the dense humid rainforest ecosystems of West and Central Africa and grows alongside other traditionally valued forest crops. This chapter suggests the need to incorporate sustainable practices, including organic cultivation, agroforestry, and further research into the phytomedicinal and traditional benefits of the plant such as the use of molecular docking techniques with compounds from *G. kola* using the 3D structures of these compounds and target proteins, as well as specialized software and expertise in computational chemistry.

2 Origin and Distribution of *Garcinia kola*: The Bitter Kola Tree

The center of origin of *G. kola* is believed to be in the rainforests of West and Central Africa where the plant has enjoyed a long history of cultivation and widespread distribution throughout the region (Fig. 1). However, it is generally accepted that bitter kola's natural habitat is within the lush, tropical rainforests of Africa, which includes several countries like Nigeria, Cameroon, Ghana, Cote d'Ivoire (Ivory Coast), Sierra Leone, Liberia, Equatorial Guinea, Gabon, Congo, and the Democratic Republic of Congo in lush, humid environments [107]. These areas are also known for their rich biodiversity and diverse flora within which *G. kola* has naturally thrived for centuries [83]. In these rainforests, bitter kola has deep cultural, medicinal, and ecological significance. It has been used in traditional medicine, is a symbol of hospitality, and plays a role in the local ecosystems as a source of sustenance for various wildlife species. Wild stands of *G. kola* are also supported by present and ongoing cultivation efforts.

In Nigeria, the plant is extensively grown in various southern states such as Ogun, Ondo, Edo, and Cross River. Nigerian farmers have played a significant role in the production of bitter kola, making it a substantial part of the country's agricultural economy [61]. In Cameroon, *G. kola* is also prevalent in the southern

Fig. 1 Distribution of *Garcinia kola* in Africa. (Source: Maňourová et al. [81] (CC BY 4.0))

and central regions of the country. The plant is found in the dense rainforests that characterize these areas. Bitter kola is cultivated and harvested in regions with suitable rainforest conditions in Ghana and has a long history of traditional use especially in traditional ceremonies. In Cote d'Ivoire, kola can be found in the rainforests of the southwestern part of the country. Nigeria, Cameroon, Ghana, and Cote d'Ivoire are among the primary producers of bitter kola but the plant is also present in other West and Central African nations with suitable rainforest habitats including Sierra Leone, Liberia, Equatorial Guinea, Gabon, Congo, and the Democratic Republic of Congo. It thrives in the humid, equatorial climate and is well adapted to the dense, evergreen rainforests where it receives abundant rainfall and high levels of humidity.

The life span of *G. kola* can vary depending on a range of factors, including environmental conditions, disease, and other stressors [108]. Generally, bitter kola is a long-lived tree with a potential for longevity under favorable circumstances. In the wild, *G. kola* life span can extend from several decades to potentially over a century. However, in cultivated settings or agroforestry systems, the life span may be influenced by factors such as management practices and environmental conditions. The longevity of *G. kola* is closely tied to the environmental conditions in which they grow. Adequate rainfall, suitable soil conditions, and a lack of significant stressors can contribute to longer life spans. Conversely, factors like drought, disease, or damage from pests may shorten a tree's life. The susceptibility of bitter kola trees to diseases and pests can influence their lifespan. Healthy trees that are well-maintained and protected from threats are more likely to live longer. Human activities, such as logging and habitat destruction, can significantly impact the life span of bitter kola trees in the wild. Deforestation and logging can lead to prematurely removing these trees from their natural habitat. The presence of young trees and successful regeneration through seed dispersal, as well as the presence of both male and female trees for pollination (as bitter kola is dioecious), can contribute to the perpetuation of the species. It is worth noting that *G. kola* has no specific fixed life span, individual trees can live for several decades or more under favorable conditions. Bitter kola can thrive in its natural rainforest habitat due to the long reproductive cycle and adaptive capabilities of the plant. However, like many species in tropical rainforests, the ongoing challenges of habitat loss and environmental changes due to human activities can pose threats to its continued existence in the wild. Conservation efforts are essential to protect and sustain populations of *G. kola* and other valuable rainforest species.

3 Botanical Overview of *Garcinia kola*

G. kola belongs to the plant family Clusiaceae (formerly known as Guttiferae) within the broader classification of angiosperms, eudicots, and Malpighiales. The *Garcinia* genus comprises over 200 species of flowering plants. The genus is known for containing numerous species, many of which are tropical evergreen trees and shrubs. *Garcinia kola* shares its genus with other *Garcinia* species, some of which have also been of cultural and economic importance. Some relatives of *G. kola* are *Garcinia mangostana* (mangosteen), *Garcinia cambogia* which has small, pumpkin-shaped fruit and is native to Southeast Asia and India, *Garcinia gummi-gutta*, which is widely used in Southeast Asia in traditional cooking due to the strong sour flavor to dishes, *Garcinia indica* (kokum or kokam), which is native to the Western Ghats region of India and valued for its fruit that is used in culinary applications and traditional medicine, *Garcinia atroviridis* (asam gelugur), a tropical fruit tree native to Southeast Asia with sour fruits used in traditional cooking, especially in Malaysian and Thai cuisine and *Garcinia livingstonei* (imbe) that is native to Southern Africa and has edible fruits with a sweet and tangy flavor. *G. kola* is a small- to medium-sized evergreen tree with a straight trunk and dense, glossy leaves [45]. The tree produces fruit pods containing seeds, which are commonly referred to as kola nuts. These seeds are the most renowned part of the plant and are known for their intensely bitter taste.

3.1 Morphological Characteristics of *Garcinia kola*

The plant is a small- to medium-sized evergreen tree that typically reaches heights ranging from 7 to 15 m, although some specimens can grow up to 30 m under favorable conditions. The leaves of *G. kola* are simple, glossy, and dark green [45]. Leaves are arranged oppositely on the branches and are elliptical or oblong. The leaves have a prominent midrib and lateral veins. Bitter kola trees produce small, greenish-yellow to pale-green flowers [24]. The flowers are unisexual, meaning they occur as either male or female on the same tree. They are typically solitary or arranged in clusters at the leaf axils. The fruit of *G. kola* is a berry-like capsule. It is approximately 5–7 cm in diameter and contains several seeds. When ripe, the fruit turns brown or reddish-brown. Inside the fruit are the seeds, which are commonly referred to as kola nuts. These seeds are the most celebrated part of the plant and are known for their intensely bitter taste. Seeds of *G. kola* are brown, oblong, and roughly 2–4 cm in length. They have a hard outer shell and are divided into segments, each containing a cotyledon. The bitterness of the seeds is due to the presence of compounds such as caffeine and theobromine [56, 102].

3.2 Reproductive Features of *Garcinia kola*

Garcinia kola is a dioecious plant, meaning it has separate male and female flowers on different trees. To produce fruit, both male and female trees need to be present in close proximity for pollination to occur. The reproductive features of *G. kola* are essential for understanding how this plant reproduces and produces seeds for propagation. Kola is a dioecious plant, which means it has separate male and female trees. In dioecious species, individual trees are either male or female, and both types are required for successful reproduction. This reproductive strategy is common in many tree species and ensures genetic diversity in the population. The flowers of *G. kola* are unisexual, meaning that individual flowers are either male or female. This characteristic is typical in dioecious plants. The male flowers produce pollen, which contains the male reproductive cells (sperm). These flowers typically have stamens with anthers that release pollen. Female flowers have structures called carpels that contain the ovules, which eventually develop into seeds if fertilized. The female flowers receive pollen from the male flowers to initiate fertilization. The flowers are typically pollinated by insects, particularly bees and butterflies. These insects transfer pollen from the male flowers to the female flowers while foraging for nectar. After successful pollination, the female flowers develop into fruit. The fruit of *G. kola* is a berry-like capsule. Inside the fruit, the fertilized ovules develop into seeds. These seeds are commonly referred to as kola nuts. The number of seeds produced can vary depending on various factors, including the health of the tree and the effectiveness of pollination. Bitter kola seeds are primarily dispersed by animals. Various wildlife species, including rodents, primates, and birds, consume the seeds and then disperse them in different locations [88]. This process aids in seed dispersal and allows new plants to be established in different areas. Once a bitter kola seed is dispersed and finds a suitable environment, it germinates. Germination is the process by which a seed sprouts and begins to grow into a new plant. As the seedling grows, it develops into a juvenile tree, eventually reaching maturity and producing flowers and fruits. This reproductive cycle continues as long as there are both male and female trees in proximity to facilitate pollination. This reproductive strategy enhances genetic diversity within the species and contributes to the sustainability of bitter kola populations in their natural habitat.

4 Phytochemical Constituents of *Garcinia kola*

Bitter kola is rich in biologically active compounds and some of them are responsible for the color, flavor, and disease resistance of the plants. These chemical compounds are not necessarily considered essential nutrients like vitamins and minerals, but they play a crucial role in human health [6, 34, 35]. Consuming a diet rich in phytochemicals has been associated with numerous health benefits, including antioxidant and anti-inflammatory effects, as well as potential protection against chronic diseases such as cancer, heart disease, and diabetes [43, 71]. The phytochemicals in *G. kola* include flavonoids, polyphenols, alkaloids, saponins, tannins, terpenes, and many others [46].

Some of the alkaloids found in *G. kola* are caffeine and theobromine and they are known to possess pharmacological effects on humans [58, 59]. For instance, caffeine has a stimulating effect on the central nervous system and can increase alertness and energy levels when consumed while theobromine has mild stimulant properties and can dilate blood vessels. Although the levels of caffeine and theobromine in bitter kola may not be as high as in coffee or chocolate, their presence contributes to the plant's stimulant properties [87]. Tannins found in *G. kola are* polyphenolic compounds that are known for their astringent taste [84]. They can bind to proteins and minerals, and they have antioxidant properties. Polyphenols are a group of naturally occurring compounds known for their antioxidant properties. The plant also contains ellagic acids, which are a kind of polyphenol with antioxidant properties [85]. Ellagic acid has been studied for its potential health benefits, including its role in protecting cells from oxidative damage. Examples of flavonoids found in *G. kola* are quercetin and kaempferol [18]. These compounds have antioxidant, anti-inflammatory, and potential anticancer properties [109]. Quercetin has been studied for its potential role in reducing the risk of chronic diseases while kaempferol has been associated with various health benefits, including cardiovascular health [55]. Saponins are natural compounds also found in kola with diverse biological activities and are often responsible for the foaming properties of certain plant extracts. Garcinol is a type of polyisoprenylated benzophenone found in *Garcinia* species, including bitter kola [27, 51, 52]. It has been studied for its potential anti-inflammatory and antioxidant properties. Garcinol has also shown promise in research for its anticancer effects. Kolaviron is a complex bioactive compound found in bitter kola [86]. It is a mixture of flavonoids and other bioactive compounds. Kolaviron has been extensively studied for its potential therapeutic effects, including its antioxidant, anti-inflammatory, and hepatoprotective properties [28]. It is considered one of the key

Table 1 Health benefits of phytochemicals found in *Garcinia kola*

Phytochemicals in *G. kola*	Health benefits and uses
Alkaloids	
Caffeine	Natural stimulant, increases alertness and energy. Potential to improve mental focus and concentration. May alleviate fatigue and drowsiness. Used in some traditional remedies for its stimulating effects.
Theobromine	Potential vasodilatory properties may support cardiovascular health. Mild stimulants can have a relaxing effect on smooth muscles.
Tannins	
Ellagic	Potential role in cancer prevention and treatment. May have anti-inflammatory effects. Strong antioxidant, helps protect cells from oxidative damage.
Flavonoids	
Quercetin	Potential for reducing the risk of chronic diseases. May support heart health by improving blood vessel function. Anti-inflammatory properties may reduce inflammation. Potent antioxidant, protects cells from free radical damage.
Kaempferol	Potential anticancer properties. Cardiovascular benefits, support heart health. Antioxidant helps neutralize harmful free radicals. Anti-inflammatory effects may reduce inflammation.
Saponins	
Garcinol	Investigated for its potential in cancer prevention and treatment. Antioxidant effects, help combat oxidative stress. Potential anti-inflammatory properties.
Kolaviron	Strong antioxidant, that protects cells and tissues from oxidative damage. May have antimicrobial and antiviral activities. Hepatoprotective properties support liver health. Anti-inflammatory effects, may alleviate inflammation.
Polyphenols	
Gallic acid	Potent antioxidant, that protects cells from oxidative stress. Potential for cancer prevention and treatment. May support heart health by improving blood vessel function. Anti-inflammatory effects, reduce inflammation.

compounds responsible for some of the medicinal properties attributed to bitter kola. Bitter kola contains gallic acid, a polyphenolic compound with antioxidant properties. Gallic acid has been studied for its potential health benefits, including its role in protecting cells from reactive oxygen species. Some of the health benefits of secondary phytochemicals found in bitter kola are presented in Table 1.

5 Nutritional Properties of *Garcinia kola*

Bitter kola is used as a food and flavoring ingredient in various cultural contexts and is primarily known for its intense bitterness, which is not always suitable for all tastes [17, 93, 103, 104]. Additionally, it is consumed in moderation due to its bitter taste and potential effects on digestion. Common food uses of *Garcinia kola* are presented in Table 2.

Table 2 Common food uses of bitter kola

Food and related uses	Description
Snack (chewing snack)	Bitter kola seeds are often chewed as a snack. They have a distinctly bitter taste and are enjoyed for their flavor and potential health benefits.
Flavoring agent	Ground or powdered bitter kola is sometimes used as a natural flavoring agent in traditional African cuisine, adding a unique bitterness to dishes.
Traditional soup	Bitter kola may be added to traditional soups and stews, especially in West African cuisine, to enhance the flavor and impart its distinctive bitterness.
Beverage infusion	Bitter kola can be infused in water or other liquids to create a bitter, aromatic beverage. This infusion is sometimes used for its potential medicinal properties.
Medicinal concoction	In some cultures, bitter kola is used to prepare medicinal concoctions or teas to address various health issues, such as digestive discomfort or coughs.
Condiments and seasoning	Ground or crushed bitter kola can be used as a condiment or spice to season dishes, similar to how other spices like pepper or chili are used.

Garcinia kola is consumed for its cultural, traditional, and potential medicinal properties rather than its nutritional content. However, bitter kola is not typically consumed as a primary source of nutrition, it does contain some nutrients and bioactive compounds. Some nutritional properties of *G. kola* include:

Bitterness: The most prominent characteristic of bitter kola is its intense bitterness, which is attributed to the presence of compounds like caffeine and theobromine. This bitterness is not related to its nutritional value but rather to its flavor profile [110].

Phytochemicals: Bitter kola contains bioactive phytochemicals many of which have known health benefits like stimulatory effects on the central nervous system and antioxidant properties. Bitter kola contains antioxidants, which can help protect cells from oxidative damage. Antioxidants play a role in overall health and may contribute to the plant's potential health benefits [111–113]. Kolaviron which is also present in bitter kola has therapeutic effects. These compounds are more related to their traditional and medicinal uses rather than their nutritional content [119].

Vitamins and Minerals: Bitter kola contains trace amounts of certain vitamins and minerals, although not in significant quantities to meet daily dietary requirements. These may include small amounts of vitamin C, vitamin A, and calcium [6, 34, 35].

Fiber: Bitter kola may contain dietary fiber, although the fiber content is relatively low. Fiber is important for digestive health and can help regulate bowel movements.

6 Traditional Uses of *Garcinia kola*

The ethnobotany of *Garcinia kola* is deeply rooted in the cultures and traditions of West and Central Africa. This remarkable plant has played a significant role in the lives of indigenous communities for centuries, offering a rich tapestry of uses and cultural significance. The small- to medium-sized evergreen tree that is native to the

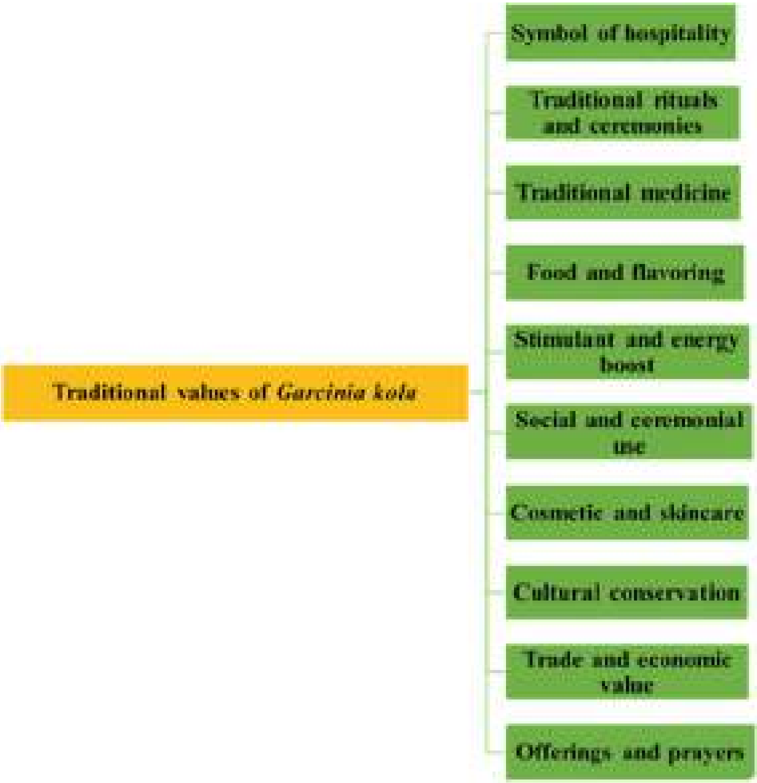

Fig. 2 Cultural values of *Garcinia kola*

dense humid rainforests of West and Central Africa bears bitter-tasting kola seeds. These seeds, with their intense bitterness, have become iconic and emblematic of the region's cultural heritage. Some of the cultural significance of *G. kola* include (Fig. 2):

- **Symbol of Hospitality**: Bitter kola is synonymous with hospitality in many West African cultures. It is customary to offer kola nuts to guests as a gesture of warm welcome and respect. The act of sharing bitter kola during social gatherings and ceremonies signifies unity and goodwill.
- **Traditional Rituals and Ceremonies**: Bitter kola plays a pivotal role in various traditional rituals and ceremonies across West and Central Africa. Its presence can be seen in rites of passage, ancestral worship, and spiritual offerings. The nuts are often included in sacrificial offerings to deities, ancestors, or spirits, depending on the cultural context.
- **Traditional Medicine**: One of the most profound ethnobotanical aspects of bitter kola is its esteemed place in traditional African medicine [22]. The plant has been harnessed for centuries to address a wide array of health issues. It is traditionally

believed to have therapeutic properties for ailments such as coughs, colds, malaria, and stomach aches [38, 44]. Others are:

  - **Digestive Aid**: The intense bitterness of bitter kola is thought to be beneficial for digestion [25]. It is often consumed after meals to alleviate digestive discomfort and promote healthy digestion.
  - **Antimicrobial Properties**: In traditional practices, bitter kola has been used for its potential antimicrobial properties [42, 54]. It is regarded as a natural remedy to combat certain infections.
  - **Anti-inflammatory Effects**: Some traditional uses involve the application of bitter kola for its anti-inflammatory effects [1]. It is used externally to reduce inflammation and promote healing.
- **Food and Flavoring**
  - **Chewing Snack**: Bitter kola seeds are occasionally chewed as a snack. The unique and intense bitterness of the seeds is appreciated by those who have acquired a taste for them. It is a common sight to see people chewing bitter kola, especially during social gatherings and leisure time.
  - **Seasoning**: Bitter kola can be ground or crushed and used as a seasoning or condiment in traditional African dishes. It imparts a distinctive bitterness to the food, enhancing its flavor. Bitter kola-infused dishes are celebrated for their unique taste.
- **Stimulant and Energy Boost**
  - **Caffeine Content**: Bitter kola contains caffeine, a natural stimulant. This caffeine content contributes to its traditional use as a source of increased alertness and energy. It is often consumed to combat fatigue and drowsiness, especially during long journeys or night vigils.
- **Social and Ceremonial Use**
  - **Weddings and Celebrations**: Bitter kola occupies a prominent place in weddings and celebratory ceremonies. It is shared among participants as part of the cultural festivities, symbolizing joy and unity.
  - **Religious Gatherings**: In both cultural and religious gatherings, bitter kola is distributed among attendees as a symbol of unity and shared values. It is believed to foster harmony and goodwill among the participants.
  - Traditional ritual: Bitter kola is used in various traditional rituals and ceremonies in Africa, often associated with spiritual and cultural practices.
- **Offerings and Prayers**: Bitter kola is considered a sacred plant of spiritual significance by some communities. It is used in offerings and prayers to seek protection, blessings, or favor from the spiritual realm [60]. The intense bitterness of the seeds is believed to make them particularly potent in spiritual contexts.
- **Cosmetics and Skincare**: Bitter kola has been used topically for skin care and cosmetic purposes. It is believed to have properties that benefit the skin, such as reducing blemishes and promoting a healthy complexion.
- **Trade and Economic Value**: Bitter kola holds commercial economic significance beyond its cultural and traditional roles. It is traded and sold in local markets, serving as a source of income for communities engaged in its cultivation and trade [116]. This economic value has contributed to its continued cultivation and importance.

- **Cultural Conservation**: The cultural and traditional importance of bitter kola has sparked efforts to conserve and protect this species and its natural habitat. Communities recognize the need to preserve the tree that holds such a central place in their heritage [94, 100, 101].

7 Modern Scientific Research on Ethnomedical Uses and Pharmacological Potentials of *Garcinia kola*

Garcinia kola has also been studied for its potential pharmacological properties. These properties are largely attributed to the various phytochemical constituents found in the plant. Pharmacological properties of *Garcinia kola* include (Fig. 3):

Fig. 3 Health benefits of *Garcinia kola*

Antimicrobial Properties: Bitter kola has been investigated for its antibacterial properties [68]. Some studies suggest that extracts from bitter kola may have inhibitory effects against certain pathogenic bacteria, potentially making it useful in combating bacterial infections [23, 42]. Research has shown that bitter kola contains compounds with antimicrobial properties, which may help combat certain bacteria and viruses [57]. It has been used traditionally to treat infections, coughs, and colds. Research has also indicated that bitter kola extracts may exhibit antifungal activity [66]. This property could have applications in addressing fungal infections.

Antioxidant Activity: Bitter kola contains various phytochemicals, including flavonoids, polyphenols, and tannins, that possess antioxidant properties [68]. Antioxidants help neutralize harmful free radicals, reducing oxidative stress and potentially contributing to overall health. The presence of compounds like ellagic acid, quercetin, and gallic acid in bitter kola contributes to its antioxidant effects [72]. Bitter kola can help protect the body's cells from oxidative damage, potentially contributing to overall health and well-being [4].

Anti-Inflammatory Effects: Some studies have explored the anti-inflammatory potential of bitter kola. Inflammation is a key factor in various chronic diseases, and the anti-inflammatory properties of bitter kola compounds like garcinol and kolaviron may have therapeutic implications [2, 3, 5, 73]. Some compounds found in bitter kola have anti-inflammatory properties, which may make it beneficial for alleviating pain and inflammation in conditions like arthritis.

Hepatoprotective Properties: Kolaviron, a bioactive compound found in bitter kola, has been studied for its hepatoprotective (liver-protective) effects [2, 3]. It may help protect the liver from damage caused by toxins and oxidative stress ([8, 26]; Adaramoye and Adeyemi 2012). This hepatoprotective property is particularly significant in regions where liver diseases are prevalent.

Antidiabetic Potential: Some research has suggested that bitter kola may have antidiabetic properties. Extracts from bitter kola have been studied for their potential to lower blood glucose levels and improve insulin sensitivity [7, 19, 63]. These effects could be beneficial for individuals with diabetes or those at risk of developing the condition.

Antimalarial Activity: Traditional medicine practices have long used bitter kola for its potential antimalarial properties [38]. While more research is needed, some studies have explored the plant's efficacy against the malaria parasite. Bitter kola's antimalarial potential may be attributed to its phytochemical constituents.

Cardiovascular Health: The antioxidant and anti-inflammatory properties of certain bitter kola compounds may have positive effects on cardiovascular health [20, 22, 49]. These properties can help reduce the risk of cardiovascular diseases by protecting blood vessels and reducing inflammation.

Analgesic and Anti-Inflammatory Effects: Some traditional uses of bitter kola involve its application as an analgesic (pain reliever) and anti-inflammatory agent, particularly for addressing musculoskeletal pain and inflammation [79]. These effects may be attributed to its anti-inflammatory compounds, which can provide relief from various painful conditions.

Anticancer Potential: While research is in its early stages, some studies have explored the potential anticancer properties of bitter kola compounds, including garcinol and kolaviron [9, 10, 21]. These compounds have demonstrated anti-cancer effects in laboratory studies, but further research is needed to determine their clinical applications [29, 74].

Digestive Aid and Gut Health Improvement: Bitter kola is often consumed to relieve digestive discomfort, such as bloating, indigestion, and constipation [75]. It is believed to stimulate digestion and promote the flow of gastric juices.

Aphrodisiac: Bitter kola is sometimes regarded as an aphrodisiac and is believed to enhance sexual performance and libido in some cultures [14–16]. However, scientific evidence supporting these claims is limited.

Weight Loss: Some individuals have explored the potential of bitter kola for weight loss due to its reputation as an appetite suppressant [72, 75, 76]. However, more research is needed to confirm its effectiveness for this purpose.

Although bitter kola shows promise in various pharmacological areas, much of the research is preliminary, and further studies are required to fully understand its mechanisms of action and therapeutic potential [82]. Additionally, the traditional uses of bitter kola should not replace conventional medical treatments, and individuals with specific medical conditions should consult healthcare professionals for appropriate guidance and treatment.

8 Toxicity of *Garcinia kola*: Safety Considerations and Side Effects

The use of *Garcinia kola* for health management is generally considered safe when consumed and used in moderation. It has a long history of traditional use in West and Central Africa for various purposes, including as a cultural symbol, a traditional remedy, and a dietary component. However, like many natural products, bitter kola should be used with caution, and excessive consumption can lead to potential adverse effects. Some potential toxic considerations associated with bitter kola include:

- **Bitter Taste and Sensitivity**: The most notable characteristic of bitter kola is its intensely bitter taste. Some individuals may find the taste unpleasant or intolerable, which can limit their consumption. Additionally, individuals with heightened sensitivity to bitter flavors may experience discomfort when consuming bitter kola.
- **Caffeine Content**: Bitter kola contains caffeine, a natural stimulant. While the caffeine content in bitter kola is not as high as in coffee or certain other sources, excessive consumption of caffeine can lead to side effects such as nervousness, restlessness, insomnia, and increased heart rate. People who are sensitive to caffeine should consume bitter kola in moderation.
- **Potential Allergic Reactions**: As with any food or natural product, some individuals may be allergic to specific components of bitter kola. Allergic reactions

can range from mild symptoms like itching or hives to more severe reactions that may require medical attention. If you have known food allergies or experience allergic symptoms after consuming bitter kola, you should avoid it.

- **Gastrointestinal Distress**: Excessive consumption of bitter kola seeds can sometimes lead to gastrointestinal discomfort, including stomachaches, indigestion, or diarrhea. The bitter taste of the seeds may also trigger nausea in some individuals.
- **Interactions with Medications**: Bitter kola contains bioactive compounds that could potentially interact with certain medications. If you are taking prescription medications or have underlying health conditions, it is advisable to consult with a healthcare professional before adding bitter kola to your diet to avoid potential interactions.
- **Liver Health**: While bitter kola has been studied for its potential hepatoprotective (liver-protective) properties, consuming extremely large quantities of bitter kola or its extracts may have unintended effects on liver function [11, 13]. Moderation in consumption is key.
- **Pregnancy and Lactation**: Pregnant and breastfeeding women should be cautious when consuming bitter kola. Limited information is available on the safety of bitter kola during pregnancy and lactation, so it is advisable to consult a healthcare provider before using it during these periods.
- **Children and Seniors**: Due to differences in sensitivity and metabolism, children and seniors may be more vulnerable to the effects of bitter kola. Care should be taken to limit consumption and ensure that it does not adversely affect their health.
- **Individual Variability (Quality and Source)**: The quality and safety of bitter kola products can vary. It's important to obtain bitter kola from reputable sources to ensure it has been handled and processed appropriately. Individual tolerance and sensitivity to bitter kola can vary widely. What is well-tolerated by one person may cause discomfort in another. Start with small quantities to assess your response.

As with any dietary supplement or natural product, it is important to use bitter kola in moderation and be aware of your tolerance. However, individual tolerance and sensitivity can vary, so it's wise to exercise caution and practice moderation. If you have specific health concerns, allergies, or are taking medications, it is advisable to consult with a healthcare professional before incorporating bitter kola into your diet or using it for medicinal purposes. If you have specific health concerns or are taking medications, consult with a healthcare professional before incorporating bitter kola into your diet. Additionally, if you experience any adverse reactions after consuming bitter kola, discontinue use and seek medical advice.

9 Recommendation for Further Research: Molecular Docking Studies with Compound from *Garcinia kola*

Molecular docking is a computational technique used in drug discovery and bioinformatics to predict the binding interactions between small molecules (ligands) and target proteins (receptors) [36]. Conducting specific molecular docking studies with compounds from *G. kola* using the 3D structures of these compounds and target proteins, as well as specialized software and expertise in computational chemistry. General steps involved in molecular docking as suggested in Adewole et al. [18] include:

1. **Data Preparation**: Obtain the 3D structures of the compounds from Garcinia kola (e.g., using chemical structure databases or software tools). Acquire the 3D structure of the target protein or receptor of interest (e.g., from protein structure databases or experimental methods like X-ray crystallography).
2. **Ligand Preparation**: Prepare the ligands (compounds from Garcinia kola) by assigning partial charges and optimizing their 3D conformations. This step ensures that the ligands are in a suitable format for docking.
3. **Receptor Preparation**: Prepare the receptor (target protein) by assigning partial charges, adding hydrogen atoms, and optimizing its 3D conformation. This step ensures that the receptor is in a suitable state for docking.
4. **Grid Generation**: Create a grid or docking box around the active site of the target protein. The grid defines the region where ligands will be docked and scored for binding affinity.
5. **Docking**: Use molecular docking software (e.g., AutoDock, AutoDock Vina, or other specialized tools) to dock the prepared ligands into the binding site of the target protein. The software explores various conformations and orientations of the ligands within the binding site and evaluates their interactions with the receptor based on scoring functions that account for van der Waals forces, electrostatic interactions, and other factors. Docking simulations may include energy minimization and molecular dynamics simulations to refine the ligand-receptor complexes.
6. **Scoring and Analysis**: After docking, the software calculates binding scores and ranks the ligands based on their predicted binding affinities. Lower scores typically indicate stronger binding interactions. Researchers analyze the docking results to identify potential ligands from Garcinia kola that have favorable binding interactions with the target protein. Visualization tools are often used to examine the ligand-receptor complexes and understand the nature of the interactions, such as hydrogen bonds or hydrophobic contacts.
7. **Validation and Interpretation**: Molecular docking results should be validated through experimental studies, such as binding assays or structural biology techniques, to confirm the predicted binding interactions. Interpret the docking results in the context of the specific biological or pharmacological question being investigated.

It is important to emphasize that molecular docking is a computational tool for predicting binding interactions, and its accuracy depends on the quality of the input data and the reliability of the scoring functions used. Experimental validation is crucial to confirm the predictions made through docking studies. Additionally, conducting molecular docking studies with compounds from *G. kola* would require access to the 3D structures of these compounds, which may not be readily available in public databases. Therefore, specialized research efforts would be needed to obtain or generate these structures for docking studies.

10 Some Herbal Formulations Involving *Garcinia kola* and their Active Ingredients

Garcinia kola is often consumed as a whole seed or used in traditional remedies. However, it is less common to find standardized herbal formulations involving bitter kola, especially within commercial herbal products in Western markets [116]. However, some traditional and contemporary formulations do exist, often leveraging the bioactive compounds found in bitter kola for specific health benefits. Some examples include:

1. **Bitter Kola Extracts or Tinctures**: Some herbal product manufacturers offer bitter kola extracts or tinctures. These liquid formulations typically involve the extraction of bioactive compounds from bitter kola seeds using solvents. They may be marketed for their potential health benefits, including their antioxidant properties and use in traditional medicine.
2. **Bitter Kola Capsules or Supplements**: In some regions, you can find bitter kola capsules or dietary supplements. These products are designed to provide a standardized dose of bitter kola's bioactive compounds, often with a focus on its potential health benefits.
3. **Traditional Herbal Remedies**: In many traditional healing practices across West and Central Africa, bitter kola is used as an ingredient in various herbal remedies. These formulations may include other locally available medicinal plants and are often used to address specific health conditions. For example, bitter kola may be combined with other herbs to create a remedy for coughs or digestive issues.
4. **Bitter Kola Chewing Sticks**: Bitter kola is sometimes incorporated into chewing sticks or "oral health sticks." These sticks are used for oral hygiene and teeth cleaning. The natural bitterness of bitter kola is believed to help with oral health.
5. **Bitter Kola in Traditional Drinks and Tonics**: In some traditional cultures, bitter kola is added to herbal drinks, tonics, or concoctions. These preparations are believed to have various health benefits, such as energy enhancement, digestive support, and immune system boosting.
6. **Bitter Kola and Honey Infusions**: Bitter kola can be infused in honey to create a sweet and bitter combination. This infusion is sometimes used for its potential health benefits, including its supposed immune-boosting and energy-enhancing properties.

It is important to note that while these formulations may be based on traditional knowledge and practices, scientific research on the specific health effects of bitter kola and its active compounds is ongoing. If you're interested in using herbal formulations involving Garcinia kola, it's advisable to consult with a healthcare professional or herbalist who is knowledgeable about traditional remedies. They can guide the appropriate use and dosage of such products, as well as any potential interactions or contraindications with other medications or health conditions.

11 Commercial Value of *Garcinia kola*

Garcinia kola holds commercial value primarily due to its cultural significance and traditional uses, as well as its potential medicinal properties. Although it may not be a major cash crop like some other agricultural products, bitter kola plays a vital role in the economies of certain regions in West and Central Africa and some aspects of the commercial value of *G. kola* include:

Cultural Significance: Bitter kola is deeply embedded in the cultures and traditions of West and Central Africa. It is often used as a symbol of hospitality and goodwill. The exchange of bitter kola during social gatherings, ceremonies, and rituals is a common practice, contributing to its cultural value.

Traditional Medicine: Bitter kola has a long history of use in traditional African medicine. Many indigenous communities believe in its therapeutic properties for addressing various health issues, including coughs, colds, malaria, and digestive problems. This traditional use adds to its commercial value as a natural remedy.

Trade and Local Markets: Bitter kola is traded and sold in local markets across West and Central Africa. It serves as a source of income for local communities engaged in its cultivation and trade. The sale of bitter kola in local markets contributes to the livelihoods of many people.

Export Market: Bitter kola has gained some recognition in international markets due to its potential medicinal properties and as a unique botanical product. In recent years, there has been a growing interest in the export of bitter kola to other countries, including Europe and the United States, where it is sometimes used in traditional medicine practices or as a dietary supplement.

Pharmaceutical and Nutraceutical Industries: Some pharmaceutical and nutraceutical companies have shown interest in the potential medicinal properties of bitter kola's bioactive compounds. They may use bitter kola extracts or compounds in the development of herbal supplements or traditional medicine products, adding to its commercial value.

Food and Beverage Industry: Bitter kola is occasionally used as a flavoring or seasoning in traditional African dishes, contributing to its value in the culinary industry. It imparts a distinctive bitterness to food, enhancing its flavor.

Oral Health Products: Bitter kola is sometimes incorporated into oral hygiene products, such as toothpaste and chewing sticks. These products may be marketed for their potential oral health benefits.

Cosmetics and Skincare: In some regions, bitter kola is used topically for skincare and cosmetic purposes. It is believed to have properties that benefit the skin, such as reducing blemishes and promoting a healthy complexion.

Research and Development: Scientific research on bitter kola's potential medicinal properties and bioactive compounds has spurred interest in its commercial applications. This includes the development of herbal formulations and products.

The commercial value of bitter kola is not as prominent as that of major cash crops, its importance lies in its cultural heritage, traditional uses, and potential in various industries. As interest in natural remedies and traditional medicine grows, bitter kola continues to find a place in both local and international markets, contributing to the economies of the regions where it is cultivated and traded.

12 Future Prospects of Therapeutic Roles of Garcinia kola

The therapeutic roles of *Garcinia kola* have garnered significant interest due to its traditional uses and the presence of bioactive compounds with potential health benefits. Yet much research is still needed to fully understand its mechanisms of action and therapeutic potential because bitter kola holds promising prospects in various areas of healthcare and wellness. Some potential future therapeutic roles of bitter kola include:

- **Antioxidant and Anti-Inflammatory Properties**: Bitter kola is rich in bioactive compounds like kolaviron, quercetin, and ellagic acid, which possess antioxidant and anti-inflammatory properties [30, 31]. These properties make bitter kola a potential candidate for managing oxidative stress-related diseases and chronic inflammatory conditions [39].
- **Antimicrobial and Antiviral Activity**: Preliminary studies have suggested that extracts from bitter kola may exhibit antibacterial, antifungal, and antiviral properties [50]. These findings raise the possibility of using bitter kola as a natural remedy for infectious diseases.
- **Antidiabetic Potential**: Research has indicated that bitter kola extracts may help lower blood glucose levels and improve insulin sensitivity. With the increasing prevalence of diabetes worldwide, bitter kola may have a role in managing this chronic condition.
- **Hepatoprotective Effects**: Kolaviron, a bioactive compound in bitter kola, has been studied for its hepatoprotective (liver-protective) properties [32, 40]. As liver diseases remain a global health concern, bitter kola could have applications in supporting liver health.
- **Cardiovascular Health**: Bitter kola's antioxidant and anti-inflammatory properties may have positive effects on cardiovascular health. It could potentially contribute to reducing the risk of heart disease by protecting blood vessels and reducing inflammation [41, 51].
- **Antimalarial Activity**: Traditional medicine practices have long used bitter kola for its potential antimalarial properties [33]. Further research may lead to the development of natural antimalarial remedies.
- **Analgesic Uses**: Bitter kola has been traditionally used as an analgesic and anti-inflammatory agent for addressing musculoskeletal pain and inflammation. Its potential role in pain management warrants further exploration.
- **Cancer Research**: Some studies have investigated the anticancer properties of bitter kola compounds, such as garcinol and kolaviron [37, 51]. While research is in its early stages, these compounds have shown promise in laboratory studies as potential agents for cancer prevention and treatment [74].

- **Nutraceuticals and Dietary Supplements**: Bitter kola extracts and compounds may find applications in the development of nutraceuticals and dietary supplements aimed at promoting overall health and well-being [82].
- **Cosmeceuticals and Skincare Products**: Bitter kola's potential benefits for skin health and its antioxidant properties may lead to its incorporation into cosmeceuticals and skincare products.
- **Functional Foods and Beverages**: Bitter kola may be used as an ingredient in functional foods and beverages, offering consumers a natural source of bioactive compounds with potential health benefits.
- **Continued Research and Clinical Trials**: Future research endeavors, including well-designed clinical trials, will help validate the therapeutic roles of bitter kola and establish its safety and efficacy in specific medical conditions [77, 78].

Although bitter kola shows promise in various therapeutic areas, much of the research is still in the early stages, and further studies are required to establish its clinical applications. As research progresses, bitter kola may find its place in modern medicine and complementary healthcare, offering potential alternatives or adjuncts to existing treatments.

13 Conclusion

The evergreen foliage, dioecious reproductive system, and distinctive kola nuts make *G. kola* a unique and valuable plant species in the tropical rainforest ecosystem. Beyond its ecological role, the plant's cultural and medicinal importance has solidified its place in the hearts and traditions of the people of the region. Bitter kola is a culturally significant plant in West and Central Africa with a history of traditional medicinal use. It offers potential health benefits, but it is important to approach its consumption with caution, especially if you have underlying medical conditions or are taking medications. Always consult with a healthcare professional before incorporating bitter kola or any herbal remedy into your diet or wellness routine. Kola is a culturally, medicinally, and ecologically significant plant that has been integral to the local traditions and ecosystems in West and Central Africa and beyond for centuries. However, the plant is facing numerous sustainability and conservation challenges due to habitat destruction, efforts are underway to protect this valuable plant and the rich biodiversity of African rainforests. The cultural and historical importance of *G. kola*, combined with its potential health benefits, make it a captivating subject of study and a testament to the intricate relationship between people, plants, and the environment in which they thrive. Preserving the natural habitats of plants like bitter kola is not only essential for the well-being of local communities but also for the conservation of the Earth's biodiversity and the continued exploration of the secrets hidden within the rainforests of Africa.

Vernonia amygdalina Delile (Asteraceae): An Overview of the Phytochemical Constituents, Nutritional Characteristics, and Ethnomedicinal Values for Sustainability

10

Matthew Chidozie Ogwu and Beckley Ikhajiagbe

Contents

Abstract

This chapter focuses on the ethnomedicinal values of bitter leaf (*Vernonia amygdalina* Delile (Asteraceae)) as well as the nutritional and phytochemical properties of the plant. The chapter discusses ongoing pharmacognostic and clinical research works on the plant as well as herbal products containing bitter leaf or its active ingredients, toxicity and safety considerations, and commercial

values. *V. amygdalina* is a tropical perennial plant native to West Africa. The plant is widely valued for its culinary, medicinal, and nutritional uses and has a distinctive bitter taste. Its bitter taste, once moderated, adds a unique flavor profile to traditional dishes and soups. Bitter leaf is often exchanged as a symbol of hospitality and goodwill during traditional events in West Africa. In traditional African medicine, bitter leaf has a long history of use for its health benefits. It is used as a remedy for various ailments including malaria, fever, gastrointestinal issues, pain relief, immune system boosting, antimicrobial and anti-parasitic properties, nervous system regulation, cardiovascular health maintenance, digestive aid, fever reduction, diabetes management, stomachache, and others. These health benefits are linked to the phytochemical constituents of the plant. Prominent phytochemicals in bitter leaf include vernodalin, vernolepin, vernonioside, vernomygdin, and others. Further research to ensure the conservation of the plant and the sustainability of practices associated with it is paramount.

1 Introduction

Vernonia amygdalina Delile (Asteraceae), also known as bitter leaf or African bitter leaf, is a tropical plant native to West Africa. Bitter leaf is cultivated in many West African countries, including Nigeria, Ghana, Cameroon, and others. It is often grown in home gardens and small farms. The plant is widely valued for its culinary, medicinal, and nutritional uses [5, 6]. Bitter leaf is characterized by its distinctive bitter taste and is a staple in many West African cuisines and traditional medicine practices. Different cultures prepare it in various ways, incorporating it into a wide range of dishes and soups [76, 79, 80]. However, bitter leaf is the key ingredient in the popular native soup in Southern Eastern Nigeria called ofe onugbu (bitter leaf Soup). The soup is typically made with a mixture of vegetables, meat or fish, and seasonings. The bitterness of the leaves adds a unique flavor to the soup. Bitter leaf can also be used in various vegetable dishes, stir-fries, and side dishes [9, 10, 64, 65]. It is often cooked with other vegetables and spices to balance its bitterness. To make the leaves less bitter, they are typically washed and sometimes soaked in water before use in culinary preparations. This process helps reduce the intensity of the bitter taste.

In traditional African medicine, bitter leaf has a long history of use for its potential health benefits. It is believed to have medicinal properties and is used in various remedies to address ailments such as malaria, fever, gastrointestinal issues, and more [18]. Bitter leaf contains antioxidants, which can help protect cells from oxidative damage [11]. These properties are attributed to the presence of bioactive compounds like flavonoids, polyphenols, and others [16, 17]. Bitter leaf is consumed to alleviate digestive discomfort and promote healthy digestion. It is believed to have mild laxative properties. Also, research has indicated that extracts from bitter leaf may possess antimicrobial properties, which could be valuable in combating certain infections. Bitter leaf has been studied for its anti-inflammatory effects, which may have implications for managing inflammatory conditions. Further, bitter leaf is a source of essential vitamins and minerals, including vitamins A, C, and K, as well as minerals (like calcium, magnesium, and iron) and dietary fiber [23]. Bitter leaf contains dietary fiber, which is important for digestive health and can help regulate blood sugar levels. While not a primary source of protein, bitter leaf contains some protein content [19, 22]. Bitter leaf is a versatile plant with cultural and culinary significance, and it continues to be studied for its potential health benefits. Its bitter taste, once moderated, adds a unique flavor profile to traditional dishes and soups. Additionally, as interest in natural remedies and traditional medicine grows, bitter leaf may find broader applications in wellness and healthcare [12]. Bitter leaf has cultural significance in social gatherings, ceremonies, and rituals across West Africa. It is often exchanged as a symbol of hospitality and goodwill during these events.

The diversity of *Vernonia amygdalina* reflects its adaptability to a range of ecological conditions and its cultural significance in various West African communities. This diversity is a valuable resource for both culinary traditions and potential medicinal applications, as different plant characteristics may offer unique flavor profiles and bioactive properties. Scientists and researchers continue to explore and document this diversity to better understand and utilize the potential of bitter leaf in agriculture, nutrition, and healthcare [63, 77]. *V. amygdalina* exhibits considerable diversity in terms of its morphology, habitat, and genetic makeup across its native range in West Africa. This diversity is shaped by various environmental factors, such as climate, soil conditions, and altitude, as well as genetic variations within the species. The leaves of bitter leaf plants display variations in the size and shape of their leaves. Leaves are typically broad and serrated, but variations exist. The plants can vary in growth habit, with some individuals growing as small shrubs and others as taller, more tree-like plants. The flowers of *V. amygdalina* can vary in color, size, and petal arrangement, although they are generally small and clustered. It is highly adaptable to a range of ecological niches and can be found in both forested and non-forested areas. It grows in lowland rainforests, savannas, and cultivated fields and can be found at varying altitudes, from lowland areas to higher elevations in some regions. Genetic diversity within the species contributes to variations in traits such as leaf chemistry, disease resistance, and adaptability to different environmental conditions [52]. Genetic studies have shown that different populations of bitter leaf may exhibit variations in their genetic makeup, which can influence the plant's characteristics and adaptability to local conditions. Traditional medicinal practices involving bitter leaf can vary from one region to another. Different communities may use it to address specific health concerns, resulting in variations in the formulations and remedies. Bitterness levels in bitter leaf can vary among individual plants and populations. Some plants may have more intensely bitter leaves, while others may be less bitter. Techniques to reduce bitterness are also variable.

This chapter aims to discuss the ethnomedicinal value of bitter leaf. The chapter presents the origin, distribution, and botany of *V. amygdalina*. The next sections address the nutritional and phytochemical properties as well as the food uses of bitter leaf. *V. amygdalina* has a long history of use in traditional medicine across West Africa. Other parts of the chapter are on the ethnobotanical, pharmacognosy, and clinical works, herbal products, toxicity, and commercial values of *V. amygdalina*. It is believed to have various medicinal properties, including digestive, anti-inflammatory, and antimicrobial effects. The environmental remediation and high adaptability of bitter leaf contribute to their growing widespread distribution whereas the efficacy associated with herbal remedies prepared from the plant makes it an integral part of traditional healing practices. However, further research to ensure the conservation of the plant and the sustainability of practices associated with it is paramount.

2 Origin and Distribution of *Vernonia amygdalina*

Vernonia amygdalina is native to tropical and subtropical regions of West Africa, but the exact origin within this region is not definitively known. It is largely hypothesized to have originated in the forested areas of West Africa, which encompass several countries along the western coast of the continent and a range of ecological zones, including lowland rainforests, savannas, and cultivated fields, where *V. amygdalina* has adapted and thrives [28]. The plant has a long history of traditional use in various West African cultures, and its use predates recorded history. It has been cultivated and harvested for its leaves, which are valued for their distinctive bitter taste and potential health benefits. Today, *V. amygdalina* is widely cultivated and grown in home gardens, small farms, and agricultural fields across West Africa. It is a significant part of the culinary and medicinal traditions in the region and continues to be an important cultural and economic resource. The plant's adaptability to various ecological conditions and its cultural significance have contributed to its spread and cultivation in different West African countries. It is used in a variety of traditional dishes and is an integral part of many cuisines in the region. Additionally, its medicinal properties have led to its continued use in traditional African medicine for various health concerns [69].

The distribution of bitter leaf is closely tied to the indigenous peoples and culture of West Africa, who have utilized it for generations as a valuable resource for both sustenance and traditional medicine [34]. Bitter leaf has played a vital role in the culinary and medicinal traditions of these communities, and its history is deeply embedded in their cultures. While *V. amygdalina* is native to West Africa, it has been cultivated and distributed beyond its native range due to its cultural and economic importance. Bitter leaf is cultivated in many West African countries, including Nigeria, Ghana, Cameroon, Ivory Coast, and others. It is often grown in home gardens, small farms, and agricultural fields. The plant is adapted to a range of ecological conditions, from lowland rainforests to savannas, and it is known for its hardiness and ability to thrive in diverse environments. *V. amygdalina* is distributed across multiple countries in West and Central Africa, with Nigeria being one of the primary producers and consumers of bitter leaf. In addition to its widespread distribution within West Africa, bitter leaf has garnered some recognition in international markets, particularly among African diaspora communities and those interested in African cuisine and traditional medicine [16, 17]. The distribution of *V. amygdalina* across different regions and ecological zones has led to variations in the plant's characteristics. Different populations of bitter leaf may exhibit variations in leaf size, bitterness levels, and adaptability to local conditions. These variations have contributed to the plant's adaptability and resilience, allowing it to flourish in a range of settings. As *V. amygdalina* is of significant cultural and economic importance, efforts have been made to promote its sustainable cultivation and harvesting practices. Organizations and initiatives have emerged to support small-scale farmers and promote sustainable agricultural practices for bitter leaf production.

African diaspora communities around the world, including those in Europe, North America, and other continents, have brought their culinary traditions with them. As a result, *V. amygdalina* is grown and used in some of these communities to recreate traditional dishes. In recent years, there has been an increasing global awareness of African cuisine and traditional ingredients. This has led to the availability of *V. amygdalina* in international markets, particularly in areas with a significant African diaspora. The plant's potential medicinal properties have attracted the interest of herbalists and practitioners of traditional medicine beyond Africa. As a result, bitter leaf extracts and preparations have been explored and used in various parts of the world for their potential health benefits. Scientific research on *V. amygdalina* has gained recognition globally. Researchers and scientists from different parts of the world have studied the plant's bioactive compounds, potential health benefits, and medicinal applications. While the distribution of *V. amygdalina* has expanded beyond its native range, its cultural and culinary significance remains strongest in West and Central Africa. In these regions, the plant continues to be an essential ingredient in traditional dishes, a symbol of hospitality and goodwill, and a valuable resource in traditional medicine. The global distribution of *V. amygdalina* reflects its versatility and adaptability as well as its potential to contribute to diverse culinary traditions and potential health benefits worldwide.

3 Botanical Characteristics of *Vernonia amygdalina*

Vernonia amygdalina belongs to the genus *Vernonia*, which is part of the large Asteraceae family. The genus *Vernonia* includes over 1000 species distributed across various continents, but *Vernonia amygdalina* is one of the most well-known and widely used species within this genus. Its vernacular names, such as bitter leaf, aptly describe its defining characteristic: an intensely bitter taste. The plant has a rich history deeply intertwined with the cultures of West Africa, where it is native. Its leaves, known for their bitterness, are used in a wide range of culinary dishes, traditional remedies, and cultural practices.

V. amygdalina is a perennial plant that can vary in size from a small shrub to a taller, more tree-like plant. Its growth habit can be erect or spreading. The stem of *V. amygdalina* is typically green, herbaceous, and somewhat woody at the base, especially in older plants. The leaves are the most distinctive feature of the plant [31]. They are broad, elliptical to ovate, and typically measure about 5–12 centimeters in length. The leaves have serrated or toothed margins. The upper surface of the leaves is usually dark green, while the lower surface may be lighter in color, often with a slightly pubescent (hairy) texture [32]. The leaves are arranged alternately along the stems of the plant [31]. The plant produces small, tubular flowers that are typically lavender to purple. These flowers are clustered in inflorescences, forming composite flower heads. The inflorescences vary in size and shape and can be found at the ends of branches. The plant typically blooms during its flowering season, which may vary depending on local climatic conditions [35]. The fruits of *V. amygdalina* are small achenes, often with a tuft of hairs attached to aid in wind dispersal. The defining characteristic of bitter leaf is its intense bitterness. This bitterness is attributed to the presence of certain compounds in the leaves. The roots and stem of the plant are less commonly used than the leaves. The stem is typically green and shrubby. Bitter leaf exhibits a variable growth habit. It can range from a small shrub with a bushy appearance to a taller, more tree-like plant. It can grow as a single stem or have multiple stems, depending on the conditions [47]. *V. amygdalina* possesses reproductive features typical of flowering plants. These features enable the plant to reproduce and propagate itself. It is primarily pollinated by insects, particularly bees and butterflies. These pollinators visit the flowers in search of nectar and, in the process, transfer pollen from one flower to another, facilitating fertilization. These reproductive features ensure the continuation of *V. amygdalina*'s life cycle and its ability to produce new generations of plants. While the plant is primarily valued for its culinary and medicinal uses, understanding its reproductive biology is essential for its conservation and sustainable cultivation [62] (Fig. 1).

Some botanical relatives of *V. amygdalina* include:

Vernonia calvoana (African Ironweed): *V. calvoana* is a closely related species to *V. amygdalina and* is native to Central and West Africa. Both plant species share some botanical characteristics, and like bitter leaf, *V. calvoana* has been used in traditional medicine practices.

Vernonia cinerea (Little Ironweed): *V. cinerea* is a species found in various parts of the world, including Asia, Africa, and Australia. While it is not native to Africa, it is part of the *Vernonia* genus and shares a common genus with *V. amygdalina*.

Vernonia guineensis (Guinea Ironweed): *V. guineensis* is another species within the *Vernonia* genus that is found in West and Central Africa. It is closely related to *V. amygdalina* and is used in similar ways in traditional medicine and sometimes in culinary preparations.

Vernonia galamensis (African Ironweed): *V. galamensis* is native to West Africa and is cultivated for its seeds, which are used for oil extraction.

Vernonia anthelmintica (Bitter Weed or Wormseed): While not native to Africa, *V. anthelmintica* is another species within the *Vernonia* genus that is known for its seeds, which have been used traditionally for their anthelmintic (anti-parasitic) properties.

Fig. 1 *Vernonia amygdalina* plant

Vernonia diversifolia (Variable-leaved Ironweed): *V. diversifolia* is a species found in various parts of the world, including Africa with diverse characteristics and traditional medicinal uses.

Vernonia adoensis (Ethiopian Ironweed): *V. adoensis* is native to East Africa, including Ethiopia, and has potential ethnomedicinal uses.

4 Environmental Value of *Vernonia Amygdalina*

Vernonia amygdalina possesses several environmental values and benefits, contributing to the ecosystems where it grows [3, 9]. While it is primarily known for its culinary and medicinal uses, it also plays a role in the environment in various ways. According to Ikhajiagbe et al. [33] some of these roles include:

Soil Stabilization: Like many other plants, *V. amygdalina* helps stabilize soil through its root system. The roots of the plant bind the soil particles, reducing erosion caused by rainfall and runoff.

Biodiversity Support: Bitter leaf, as a native plant in West and Central Africa, provides habitat and forage for local wildlife. Insects, including pollinators like bees and butterflies, visit its flowers for nectar, contributing to local biodiversity.

Carbon Sequestration: *V. amygdalina* absorbs carbon dioxide from the atmosphere through photosynthesis. This process helps mitigate climate change by sequestering carbon and converting it into organic matter.

Nitrogen Fixation: Some plants, including certain species within the Asteraceae family (to which *Vernonia amygdalina* belongs), have associations with nitrogen-fixing bacteria in their root nodules [19]. These bacteria convert atmospheric nitrogen into a form that plants can use as a nutrient. While not all members of the family have this ability, some may contribute to nitrogen enrichment in the soil.

Erosion Control: In its native region (West and Central Africa), flood and erosion are a growing challenge but the growth of *Vernonia amygdalina* can help prevent soil loss by stabilizing slopes and riverbanks.

Medicinal Plant Conservation: *V. amygdalina*'s value as a medicinal plant has led to conservation efforts in some regions to ensure its continued existence [61]. Preserving its natural habitat helps protect the plant and other species that depend on it.

Traditional Agroforestry Systems: In some traditional agroforestry systems, bitter leaf may be grown alongside other crops and trees, contributing to diversified and sustainable agricultural practices that are beneficial for both the environment and local communities.

The presence of *V. amygdalina* in local ecosystems contributes to maintaining ecological balance and supporting biodiversity. Recognizing the environmental values of this plant can contribute to its conservation and sustainable use in its native habitat and land management. The plant also exhibits some weedy characteristics through their

Rapid Growth: *V. amygdalina* is a fast-growing plant. Under favorable conditions, it can establish itself quickly and spread in an area.

Seed Production: The plant produces seeds in abundance. These seeds have adaptations, such as tufts of hairs that aid in wind dispersal. This can facilitate the plant's spread in the wild.

Adaptability: Bitter leaf is adaptable to a range of ecological conditions, from lowland rainforests to savannas. This adaptability allows it to thrive in diverse environments, including disturbed or cultivated areas.

Vegetative Propagation: In addition to sexual reproduction through seeds, *V. amygdalina* can propagate vegetatively. This means that new plants can sprout from stem cuttings or even root fragments under certain conditions.

Resilience: The plant is hardy and can tolerate some degree of environmental stress, including drought conditions.

Naturalized Populations: In areas where it is cultivated, *V. amygdalina* may escape cultivation and become naturalized. This can lead to the plant growing in unintended locations.

Competitive Ability: In some situations, *V. amygdalina* may outcompete other plant species for resources such as light, water, and nutrients.

In some cases, *V. amygdalina* may be intentionally cultivated as a crop, and its rapid growth and adaptability can be advantageous. In other cases, particularly in natural ecosystems, it may be considered invasive if it displaces native vegetation. Efforts to manage the spread of *V. amygdalina* in natural ecosystems should be guided by principles of conservation and biodiversity preservation. In cultivated areas, appropriate agricultural practices can help control its growth and prevent it from becoming a weed.

4.1 Bioremediation Value of *Vernonia amygdalina*

Vernonia amygdalina has demonstrated potential bioremediation value in certain environmental contexts. Bioremediation is the use of living organisms, including plants, to mitigate or clean up environmental contaminants, such as heavy metals and organic pollutants. Some bioremediation roles attributed to *V. amygdalina* in Shittu and Ikhajiagbe [81] include:

Heavy Metal Accumulation: Bitter leaf can accumulate heavy metals from the soil. Some studies have shown that it can accumulate metals such as lead, cadmium, and nickel from contaminated soil. This characteristic makes it a candidate for phytoremediation, a specific form of bioremediation that uses plants to remove, stabilize, or detoxify contaminants in soil and water.

Hyperaccumulation Potential: Some plants, including certain species within the Vernonia genus, are known as hyperaccumulators. These plants can accumulate exceptionally high concentrations of heavy metals in their tissues without displaying toxicity symptoms. *V. amygdalina* has shown the potential for hyperaccumulation of heavy metals, particularly in its leaves. This ability is advantageous in removing and concentrating contaminants for subsequent remediation.

Soil Improvement: Bitter leaf can improve soil quality through its root system and organic matter deposition. As it grows and matures, the plant's roots help enhance soil structure and nutrient content. Improved soil conditions can indirectly support bioremediation efforts by promoting the growth of other remediation plants and microorganisms.

Sustainable Remediation: The use of *V. amygdalina* for bioremediation aligns with sustainable and environmentally friendly remediation practices. It reduces the need for harsh chemicals and mechanical interventions, minimizing potential environmental harm.

Although *V. amygdalina* has shown promise in certain phytoremediation studies, its use in practical remediation applications depends on several factors, including the specific contaminants involved, site conditions, and regulatory considerations. Bioremediation is a complex process that requires careful planning and monitoring. Additionally, the effectiveness of bioremediation using *V. amygdalina* may vary depending on the extent of contamination and the suitability of the plant for the specific site. Therefore, it is essential to conduct site-specific assessments and consider the broader ecological implications when using plants for bioremediation purposes.

5 Cultural Significance of *Vernonia amygdalina*

Vernonia amygdalina holds significant historical and cultural importance in West and Central Africa. Its multifaceted significance is deeply woven into the cultural, culinary, and traditional medicinal practices of the region. Some cultural significance of bitter leaf include (Fig. 2):

- **Traditional Medicine**: Bitter leaf has a long history of use in traditional African medicine systems. Indigenous communities have employed it as a remedy for various health conditions, including malaria, fever, gastrointestinal issues, and more [18]. The plant's phytochemical composition, including bitter compounds and bioactive constituents, is believed to contribute to its potential medicinal properties.
- **Culinary Traditions**: Bitter leaf is a fundamental ingredient in West and Central African cuisine. It imparts a unique and cherished flavor to numerous dishes and soups. One of the most famous dishes featuring bitter leaf is bitter leaf soup (ofe onugbu), a delicacy enjoyed across the region. The plant is also used in vegetable dishes, stews, and side dishes.
- **Cultural Symbolism**: Bitter leaf has symbolic significance in various cultural practices and rituals. It is exchanged as a symbol of hospitality, goodwill, and friendship during social gatherings, ceremonies, and celebrations. Its presence in

Fig. 2 Cultural values of *Vernonia amygdalina*

traditional offerings and exchanges strengthens social bonds and fosters community ties.

- **Medicinal Knowledge Transfer**: The use of *V. amygdalina* in traditional medicine has been passed down through generations within African communities. Elders and traditional healers play a crucial role in transferring knowledge about the plant's medicinal properties and applications to the younger generation.
- **Cultural Identity**: Bitter leaf contributes to the cultural identity of West and Central African communities. Its inclusion in traditional dishes and remedies reflects the region's culinary heritage and medical practices. It distinguishes West and Central African cuisine from other global culinary traditions, adding a distinctive flavor profile.
- **Ethnobotanical Heritage**: *V. amygdalina* is an integral part of the ethnobotanical heritage of West and Central Africa. It exemplifies the region's rich botanical knowledge and the relationship between people and plants. Ethnobotanical studies have further illuminated the plant's uses and cultural significance within indigenous communities.
- **Cultural Conservation**: The cultural and historical importance of *V. amygdalina* has spurred efforts to conserve and protect the plant's natural habitat. Conservation initiatives aim to safeguard this valuable botanical resource.

1. **Phytochemical Constituents of *Vernonia amygdalina***

   Vernonia amygdalina contains a diverse array of phytochemical constituents, which contribute to its medicinal and nutritional properties. These phytochemicals are responsible for the plant's characteristic bitterness and its potential health benefits.

   Sesquiterpene Lactones: These are bitter compounds that are primarily responsible for the plant's intense bitterness. Sesquiterpene lactones, such as vernodalin, vernolepin, and vernomygdin, are characteristic phytochemicals of bitter leaf [24, 43].

   Alkaloids: Bitter leaf contains alkaloids, including vernodalin alkaloid, which may contribute to its medicinal properties [18, 43].

   Flavonoids: Flavonoids are a group of polyphenolic compounds found in bitter leaf. They have antioxidant properties and may play a role in protecting cells from oxidative damage [11, 29, 30].

   Steroids and Triterpenoids: Some steroids and triterpenoids, such as vernonioside A1 and vernonioside B1, have been isolated from *V. amygdalina*. These compounds may have potential pharmacological activities [20, 43].

   Phenolic Compounds: Phenolic compounds, including caffeic acid, chlorogenic acid, and quercetin, are present in bitter leaf. These compounds have antioxidant and anti-inflammatory properties [11].

   Saponins: Bitter leaf contains saponins, which are glycosides with surfactant properties. Saponins have been studied for their potential health benefits, including cholesterol-lowering effects [24].

Glycosides: Glycosides are compounds that contain a sugar molecule bonded to another molecule. Bitter leaf contains various glycosides, and some may have biological activities.

Tannins: Tannins are a group of polyphenolic compounds found in bitter leaf. They have astringent properties and may have antimicrobial effects [25, 26].

Minerals and Vitamins: Bitter leaf is a source of essential minerals such as calcium, magnesium, and iron. It also contains vitamins like vitamin A, vitamin C, and vitamin K.

Essential Oils: Bitter leaf may contain essential oils that contribute to its aroma and potential therapeutic properties [41].

The phytochemical composition of *V. amygdalina* can vary depending on factors such as the plant's age, environmental conditions, and geographic location. The combination of these phytochemical constituents gives bitter leaf its characteristic bitterness and makes it a valuable resource in traditional medicine and culinary practices in West and Central Africa. Additionally, ongoing research is uncovering the potential health benefits and pharmacological activities of these phytochemicals. Some of the essential phytochemical constituents of bitter leaf, parts found, and their usefulness are presented in Table 1.

V. amygdalina is a leafy green vegetable that is valued for its potential medicinal properties and nutritional content. While bitter leaf is primarily recognized for its bitterness and medicinal uses, it also contains various essential nutrients that contribute to its nutritional value. The approximate concentrations of mineral nutrients in bitter leaf are presented in Table 2. Bitter leaf is a source of several vitamins, including vitamin A, vitamin C, and vitamin K. These vitamins are essential for various bodily functions, including immune support, vision, and blood clotting. Bitter leaf contains important minerals such as calcium, magnesium, and iron. Calcium is crucial for bone health, magnesium is involved in various enzymatic processes, and iron is essential for red blood cell formation and oxygen transport. Bitter leaf is a good source of dietary fiber, which is important for digestive health. Fiber helps regulate bowel movements, prevent constipation, and may assist in managing weight loss [12]. Bitter leaf contains various antioxidants, including flavonoids and phenolic compounds. These antioxidants help protect cells from oxidative stress and may have anti-inflammatory properties [75]. Bitter leaf is rich in phytochemicals, such as sesquiterpene lactones and alkaloids, which are responsible for its characteristic bitterness. Some of these phytochemicals have been studied for their potential health benefits. Bitter leaf is a low-calorie vegetable, making it a suitable choice for those looking to manage their calorie intake [48]. While not a high-protein source, bitter leaf does contain some protein, which is essential for tissue repair and overall growth and development. Bitter leaf contains carbohydrates, primarily in the form of dietary fiber and small amounts of sugars. Carbohydrates provide energy for the body. Bitter leaf is naturally low in fat, making it a heart-healthy choice when included in a balanced diet. It is important to note that the nutritional content of bitter leaf can vary based on factors such as plant variety, growing conditions, and how it is prepared and cooked. Bitter leaf is often

Table 1 Some phytochemical constituents of bitter leaf, parts found, and usefulness

Phytochemical constituent	Types	Medicinal uses and potential health benefits	Part of the plant found
Sesquiterpene lactones	Vernodalin, Vernolepin, and Vernomygdin	Bitterness, anti-inflammatory, antioxidant, pain relief, and may support the immune system	Leaves
Alkaloids	Vernodalin, Vernomenin, Vernolepin, Epivernodaline, cyanogenic alkaloids	Pain relief, anti-parasitic properties, and regulations of the nervous system	Various parts
Flavonoids	Kaempferol, Quercetin, Luteolin, Rutin, Myricetin, Catechins	Antioxidant, anti-inflammatory, cardiovascular health, and support of the immune system	Leaves and stems
Steroids and triterpenoids	β-Sitosterol, Campesterol, Stigmasterol, Lupeol, β-Amyrin, Ursolic acid, Oleanolic acid, β-Amyrin, Friedelin, Betulinic acid	Anti-inflammatory, immunomodulatory, anti-cancer effects, and support skin health	Leaves
Phenolic compounds	Caffeic acid, Chlorogenic acid, Epicatechin	Antioxidant, anti-inflammatory, antioxidant, anti-inflammatory, and cardiovascular health as well as aid digestion	Leaves
Saponins	Vernoniosides, bitter saponins, steroidal saponins	Cholesterol reduction, antioxidant, and immune support	Leaves
Glycosides	Cardiac glycosides; Iridoid glycosides and Anthraquinone glycosides	Cardiac health, diuretic properties, and antioxidant effects	Leaves
Tannins	Gallotannins, proanthocyanidins, and ellagitannins	Astringent, antimicrobial effects, astringent, wound healing, antioxidant, and antimicrobial properties	Leaves
Minerals and vitamins	Calcium, potassium, sodium, phosphorus, iron, etc.	Nutritional and health value. Calcium for bone health, iron for anemia prevention, and vitamins for overall health	Leaves
Essential oils	Terpenes, eugenol	Aroma, and potential therapeutic properties. Aroma therapy has potential for skin care as well as calming effects	Leaves

used in traditional dishes in West and Central Africa, where it is typically cooked or added to soups and stews.

Note that bitter leaf's bitterness may require certain culinary techniques to make it more palatable, its potential nutritional and medicinal properties make it a valuable addition to traditional diets in many regions. However, individuals with certain medical conditions or sensitivities may need to consume bitter leaf in moderation,

Table 2 Approximate concentrations of mineral nutrients in bitter leaf

Mineral nutrient	Approximate concentration (per 100 g of fresh leaves) in mg
Calcium	309
Magnesium	109
Potassium	470
Sodium	11
Phosphorus	66
Iron	1.9
Zinc	1.6
Copper	0.14
Manganese	1.3

and it is advisable to consult with a healthcare professional or nutritionist for personalized dietary recommendations.

6 Ethnomedicinal Uses of *Vernonia amygdalina*

Vernonia amygdalina is a versatile and culturally significant plant with a rich history of ethnomedicinal uses in various regions of West and Central Africa. This plant is celebrated not only for its culinary contributions but also for its potential therapeutic properties. Bitter leaf has been a staple in the diets of various West and Central African communities for centuries. Its bitter taste, which gives the plant its name, is a defining characteristic that has shaped its culinary and medicinal roles. In many African cultures, bitter leaf is not merely an edible green but also a symbol of resilience and adaptability. The plant thrives in diverse ecological conditions, and this resilience is often associated with qualities that are admired and respected by people. Additionally, the bitterness of the leaves is seen as a metaphor for life's challenges, suggesting that strength and healing can be found even in adversity. The ethnomedicinal uses of bitter leaf are deeply intertwined with cultural practices and belief systems. Traditional healers, often referred to as herbalists or traditional medicine practitioners, play a vital role in preserving and passing down the knowledge of using bitter leaf and other medicinal plants. These healers are highly respected in their communities and are considered custodians of invaluable wisdom. Some of the prominent ethnomedicinal uses of *V. amygdalina* include (Fig. 3):

- **Malaria Treatment and Prevention**: Perhaps one of the most well-known traditional uses of bitter leaf is its role in the management of malaria. Various parts of the plant, including the leaves and stem, are used to prepare decoctions and infusions believed to have anti-malarial properties [2, 18]. The bitter leaf's role in malaria treatment aligns with its historical significance, as malaria is a prevalent and debilitating disease in many parts of Africa.
- **Fever Reduction**: Bitter leaf is often employed as a natural remedy to reduce fever. The leaves are typically brewed into a medicinal tea or used in poultices for

Fig. 3 Ethnomedicinal values of *Vernonia amygdalina*

external application. The plant's ability to lower body temperature is valued in regions where fever is a common symptom of various illnesses.

- **Digestive Health**: Bitter leaf is recognized for its digestive benefits. It is believed to aid in digestion, alleviate indigestion, and provide relief from gastrointestinal discomfort. It is sometimes consumed as a tea or added to soups and stews to promote digestive well-being.
- **Diabetes Management**: Traditional medicine practitioners in some regions use bitter leaf as an adjunct treatment for diabetes [12]. While modern scientific research on this aspect is ongoing, bitter leaf is believed to have properties that help regulate blood sugar levels.
- **Skin Care**: Bitter leaf's anti-inflammatory and antimicrobial properties make it a popular choice for treating various skin conditions. It is used topically to alleviate itching, soothe rashes, and support wound healing.

- **Cough and Respiratory Health**: Bitter leaf is often included in herbal preparations to alleviate coughs, colds, and respiratory infections. Its potential anti-inflammatory and immune-boosting properties make it a valuable component in traditional cough remedies.
- **Pain Relief**: Bitter leaf is considered an analgesic, and it is used to alleviate various types of pain, including headaches and body aches [54]. Some traditional preparations may be applied externally to painful areas.
- **Stomach Ulcer Soothing**: In some traditional systems, bitter leaf is used to soothe and potentially promote healing in cases of stomach ulcers [45]. Its reported anti-inflammatory properties may contribute to this application [66].
- **Hepatitis Support**: Traditional healers in certain regions use bitter leaf as a supportive therapy for hepatitis. It is believed to promote liver health and assist in recovery.
- **Immune System Support**: Bitter leaf is seen as a natural immune booster. Its regular consumption is thought to strengthen the immune system and enhance overall health.
- **Weight Management**: In some cultures, bitter leaf is incorporated into weight management strategies. It is believed to play a role in appetite regulation and metabolism [12].
- **Anemia Management**: Bitter leaf contains iron and other nutrients, making it a potential remedy for anemia. It may be used to support individuals with iron-deficiency anemia.
- **Hypertension**: Some traditional practitioners use bitter leaf to help manage hypertension. While research is ongoing in this area, it is believed that the plant's compounds may contribute to blood pressure regulation.

It is important to note that the ethnomedicinal uses of bitter leaf are often passed down through generations and are deeply rooted in cultural traditions. These traditional remedies are valued for their accessibility, affordability, and perceived effectiveness, particularly in regions where access to modern healthcare may be limited. Modern scientific research are ongoing into the ethnomedicinal uses of *V. amygdalina* and are well-documented in traditional systems. Modern scientific research has begun to explore the plant's potential therapeutic properties. Studies have investigated the bioactive compounds present in bitter leaf and their mechanisms of action. Some of the key findings and ongoing research areas include:

Antioxidant Properties: Bitter leaf contains various phytochemicals, such as flavonoids and phenolic compounds, which exhibit antioxidant activity. These antioxidants are believed to protect cells from oxidative stress, which is linked to various chronic diseases.

Anti-inflammatory Effects: Bitter leaf's anti-inflammatory properties have been studied, and it is considered a potential natural remedy for inflammatory conditions.

Antimicrobial Activity: Research has indicated that bitter leaf extracts may have antimicrobial properties, which can be useful in combating infections.

Hepatoprotective Potential: Studies suggest that bitter leaf may have hepatoprotective effects, potentially supporting liver health.

Immunomodulatory Effects: Bitter leaf's impact on the immune system is a subject of interest, and research is ongoing to better understand its immunomodulatory properties.

Antidiabetic Potential: Bitter leaf's role in blood sugar regulation has garnered attention, and investigations into its potential as an antidiabetic agent continue [12, 49].

It is worth emphasizing that while traditional knowledge is valuable, scientific validation is critical to fully understand the safety and efficacy of bitter leaf in modern healthcare. Researchers are working to bridge the gap between traditional and evidence-based medicine by conducting rigorous studies to assess the plant's potential benefits. Despite the promise of *V. amygdalina* as a source of natural remedies, several challenges and considerations exist:

Standardization: Traditional preparations of bitter leaf vary in terms of plant part used, preparation methods, and dosages. Standardization is crucial for ensuring consistent and safe therapeutic outcomes.

- **Safety Concerns**: While bitter leaf is generally considered safe for most individuals, there can be adverse effects if consumed in excessive quantities. Specific populations, such as pregnant women and individuals with certain medical conditions, should exercise caution.
- **Integration with Modern Medicine**: Integrating traditional remedies like bitter leaf into modern healthcare systems requires careful evaluation, regulation, and collaboration between traditional healers and healthcare professionals.
- **Preservation of Traditional Knowledge**: Preserving and passing down traditional knowledge of medicinal plants, like bitter leaf, is vital. Efforts to document and protect this knowledge are ongoing.
- **Sustainability**: The popularity of bitter leaf and other medicinal plants can lead to overharvesting and habitat degradation. Sustainable harvesting practices must be promoted.

The future of *Vernonia amygdalina* in modern healthcare lies in multidisciplinary research that combines traditional wisdom with scientific rigor. Collaborations between ethnobotanists, pharmacologists, healthcare practitioners, and local communities are essential to harness the plant's potential for the benefit of public health.

7 Pharmacognostic and Clinical Research Involving *Vernonia amygdalina*

Clinical research on *Vernonia amygdalina* will culminate in an understanding of the potential therapeutic properties and safety for human use. While traditional and ethnobotanical knowledge has long recognized the plant's medicinal value, modern clinical studies aim to provide scientific evidence to support its traditional uses and explore new applications.

- **Antimalarial Properties**: Some clinical studies have investigated the antimalarial properties of *Vernonia amygdalina*. These studies aim to assess its efficacy in the treatment and prevention of malaria, which is a prevalent and serious disease in many regions where the plant is used traditionally [2].
- **Diabetes Management**: Research has explored the effects of bitter leaf extracts or preparations on blood sugar regulation [12]. Clinical trials may investigate the potential of bitter leaf to help manage diabetes and its complications.
- **Liver Health**: Clinical studies may assess the impact of bitter leaf on liver health, including its hepatoprotective properties. Researchers aim to understand its role in supporting liver function and mitigating liver-related conditions.
- **Antioxidant and Anti-inflammatory Effects**: Investigations into the antioxidant and anti-inflammatory properties of bitter leaf are ongoing. Clinical trials may explore its potential in reducing oxidative stress and inflammation, which are associated with various chronic diseases.
- **Immune Modulation**: Some research focuses on the immunomodulatory effects of *Vernonia amygdalina* [50, 71]. Clinical studies aim to understand how it may enhance immune responses and strengthen the body's defense mechanisms.
- **Antimicrobial Activity**: Clinical research may assess the efficacy of bitter leaf extracts against specific pathogens, including bacteria, viruses, and parasites [28]. This research could have implications for infectious disease management.
- **Cancer Research**: Studies have explored the potential anticancer properties of bitter leaf compounds [38]. Clinical trials may investigate its effects on specific types of cancer and its mechanisms of action.
- **Blood Pressure Regulation**: Clinical investigations may assess the impact of bitter leaf on blood pressure regulation, potentially leading to therapeutic applications for individuals with hypertension [1, 46].
- **Safety and Tolerance**: Clinical studies also focus on evaluating the safety and tolerability of bitter leaf preparations in human subjects [73]. This includes assessing potential side effects and interactions with medications.
- **Dosage and Formulation**: Research may determine the optimal dosage and formulation of bitter leaf extracts or supplements for therapeutic use [73]. This information is important for developing standardized products.
- **Nutritional Benefits**: Clinical trials can examine the nutritional properties of bitter leaf, including its nutrient content and potential as a dietary supplement [55].
- **Traditional Medicine Validation**: Clinical research plays a role in validating the traditional uses of bitter leaf in various traditional medicine systems [7]. This can help bridge the gap between traditional and evidence-based medicine.

Note that the findings from this research work may vary depending on factors such as the specific preparation of bitter leaf, dosage, and patient populations. Collaborations between researchers, healthcare professionals, traditional healers, and local communities are crucial for conducting meaningful and culturally sensitive clinical studies on *V. amygdalina*. Additionally, regulatory considerations and ethical guidelines play a role in the design and implementation of clinical trials involving medicinal plants.

8 Toxicity and Safety Considerations of *Vernonia amygdalina*

Vernonia amygdalina is generally considered safe for consumption when used in culinary and traditional medicinal practices. It has a long history of use as a food ingredient and in traditional medicine across West and Central Africa [27, 60]. However, like many plants, bitter leaf may have certain toxic or adverse effects under certain circumstances or when consumed in excessive amounts. According to Eze et al. [27] some of the toxic considerations of bitter leaf include:

- **Bitterness and Palatability**: Bitter leaf gets its name from its bitter taste, which is a characteristic feature. While the bitterness is generally tolerated in culinary preparations, some individuals may find it unpalatable in large quantities. Bitterness can also vary among different plant varieties.
- **Cyanogenic Glycosides**: Like many plants, bitter leaf may contain small amounts of cyanogenic glycosides, which can release toxic cyanide when metabolized [16, 17]. However, the levels of these compounds are usually very low and not considered a significant health risk when consuming bitter leaf as part of a balanced diet. Proper cooking and preparation methods can further reduce the potential for cyanide release.
- **Pregnancy and Lactation**: Pregnant and lactating women are often advised to consume bitter leaf in moderation. Excessive consumption of certain phytochemicals found in bitter leaf, such as sesquiterpene lactones, during pregnancy may have adverse effects [39, 40]. It is advisable for pregnant and nursing women to consult with healthcare professionals before incorporating bitter leaf into their diets.
- **Allergies**: Some individuals may be allergic to specific compounds found in bitter leaf, leading to allergic reactions. Symptoms can include skin rashes, itching, or gastrointestinal discomfort. If allergic reactions occur, discontinuing the consumption of bitter leaf is recommended.
- **Digestive Discomfort**: In some cases, excessive consumption of bitter leaf may lead to digestive discomfort, including diarrhea or stomach upset [42, 45]. It is advisable to consume bitter leaf in moderation and observe how your body responds.
- **Interactions with Medications**: Bitter leaf may interact with certain medications due to its phytochemical content. It is important to inform healthcare providers about the use of bitter leaf, especially when taking prescription medications, to avoid potential drug interactions.
- **Individual Sensitivity**: People may vary in their sensitivity to the bitterness of bitter leaf and its potential effects on digestion. Some individuals may tolerate it well, while others may find it less agreeable.

It is important to note that the vast majority of people in regions where bitter leaf is traditionally consumed incorporate it into their diets without experiencing adverse effects. Bitter leaf is valued for its potential health benefits and nutritional value, and it is considered a safe and nutritious food when used appropriately. To mitigate potential risks and ensure safe consumption:

Cook Bitter Leaf Properly: Cooking, boiling, or blanching bitter leaf can help reduce bitterness and minimize the potential release of cyanide compounds [17]. Traditional culinary practices often involve cooking bitter leaf in soups, stews, or as a side dish.

Moderation: As with any food or herbal remedy, consuming bitter leaf in moderation is advisable. Excessive consumption of any substance can lead to adverse effects.

Consult Healthcare Professionals: It is recommended to consult certified and practicing healthcare professionals before using bitter leaf to treat or manage illness if you have underlying medical conditions, are pregnant or nursing, or are taking medications.

Although *V. amygdalina* is generally safe for most people when used in culinary and traditional medicinal practices, it is essential to be mindful of individual sensitivities and potential interactions with medications. As with any dietary ingredient, balance and moderation are key to safe and enjoyable consumption.

9 Some Herbal Formulations Involving *Vernonia amygdalina* and Their Active Ingredients

Vernonia amygdalina is a versatile plant that is often incorporated into various herbal formulations in traditional medicine across West and Central Africa. These formulations may combine bitter leaf with other herbs, roots, or natural ingredients to address specific health concerns.

Malaria Remedies: Bitter leaf is frequently used in herbal formulations to combat malaria [13]. It is often combined with other antimalarial herbs, such as *Artemisia annua* (sweet wormwood) or *Morinda lucida* (brimstone tree). These formulations may be consumed as decoctions or infusions to reduce fever and alleviate malaria symptoms [2, 15].

Digestive Tonic: Bitter leaf is sometimes included in digestive tonics or bitters. These formulations often contain a blend of bitter herbs and spices to promote digestion, alleviate indigestion, and stimulate appetite [8, 37]. Bitter leaf's natural bitterness contributes to its role in these remedies.

Cough and Cold Remedies: Bitter leaf is used in herbal preparations aimed at relieving coughs, colds, and respiratory infections [70]. It may be combined with other respiratory herbs like ginger, garlic, and honey to create soothing and immune-boosting remedies.

Anti-Inflammatory Mixtures: Bitter leaf's potential anti-inflammatory properties make it a valuable component of herbal formulations aimed at reducing inflammation [13, 53, 83]. These mixtures may include other anti-inflammatory herbs like turmeric, ginger, and neem.

Liver Support Formulas: Bitter leaf is used in herbal formulations to support liver health and promote detoxification [13, 36]. These remedies may include herbs, such as dandelion root, milk thistle, and burdock root.

Wound Healing Salves: Bitter leaf extracts or poultices are sometimes applied topically to wounds, cuts, and skin irritations to promote healing and prevent infection [44]. The plant's antimicrobial properties are believed to contribute to its effectiveness in this regard.

Diabetes Management: In some traditional systems, herbal formulations are prepared to help manage diabetes [14, 74]. Bitter leaf may be a key ingredient, as it is believed to have blood sugar-regulating properties. Other diabetes-supportive herbs such as fenugreek or cinnamon may be included.

Immune-Boosting Tonics: Bitter leaf is often incorporated into immune-boosting tonics to enhance overall health and strengthen the immune system [50, 72]. These formulations may contain a combination of immune-enhancing herbs like garlic, ginger, and echinacea.

Anti-hypertensive Mixtures: Some herbal preparations aim to help manage hypertension. Bitter leaf's potential role in blood pressure regulation is considered when formulating these remedies, and it may be combined with other blood pressure-supportive herbs like hawthorn or olive leaf [51].

Anti-parasitic Remedies: Bitter leaf is used in herbal formulations designed to combat intestinal parasites [21]. These remedies may include other anti-parasitic herbs like wormwood, black walnut, or cloves.

Note that specific herbal formulations and recipes can vary widely across different cultures and regions. Traditional medicine practitioners, often referred to as herbalists or traditional healers in West and Central Africa, possess unique knowledge and expertise in crafting these remedies based on local traditions and available resources. While traditional herbal formulations can offer potential health benefits, it is essential to exercise caution and consult with healthcare professionals, especially when using herbal remedies alongside prescription medications or for the treatment of serious medical conditions. Additionally, the safety and efficacy of these formulations should be considered in light of scientific research and evidence-based practices.

10 Commercial Value of *Vernonia amygdalina*

Vernonia amygdalina holds commercial value in several ways, primarily driven by its culinary and potential medicinal uses. Its commercial significance varies across different regions and markets [59, 78].

Culinary Use: Bitter leaf is a popular and essential ingredient in the cuisines of many West and Central African countries. It is used in a wide range of traditional dishes, soups, stews, and sauces. Due to its unique bitter flavor, it adds depth and complexity to the taste of these dishes, making them culturally significant. In some regions, processed or packaged bitter leaf products are available for convenience.

Traditional Medicine: Bitter leaf has a long history of use in traditional medicine across Africa [67, 68]. As interest in herbal and natural remedies grows globally, there is potential commercial value in the development and marketing of herbal products containing bitter leaf extracts or formulations. These products may be promoted for their potential health benefits, including immune support, anti-inflammatory properties, and digestive health.

Pharmaceutical and Nutraceutical Industries: The phytochemical compounds found in bitter leaf, such as flavonoids, phenolic compounds, and sesquiterpene lactones, have attracted the attention of researchers and the pharmaceutical industry. There is ongoing exploration of the potential use of these compounds in drug development and nutraceutical products.

Export Market: Bitter leaf has gained recognition in international markets, especially among African diaspora communities. It is exported to countries with large African populations or those interested in African cuisine. In some regions, dried or frozen bitter leaf is exported to meet the demand of African expatriates and consumers interested in African culinary traditions.

Herbal and Dietary Supplements: Bitter leaf is sometimes used as an ingredient in herbal supplements and dietary products. These supplements are marketed for various purposes, such as immune support, detoxification, and digestive health.

Cultivation and Farming: As the demand for bitter leaf increases, there may be opportunities for commercial cultivation and farming of *Vernonia amygdalina*. Controlled cultivation can ensure a consistent supply of high-quality bitter leaf for domestic and international markets.

Traditional Food Processing: Traditional food processors who specialize in preparing and packaging bitter leaf for sale may contribute to its commercial value. These businesses may operate in local markets and play a role in preserving culinary traditions.

Research and Development: Research institutions and organizations may invest in the research and development of bitter leaf-based products and formulations. This can lead to innovations in the food, pharmaceutical, and nutraceutical industries.

Herbal Tea and Beverage Industry: Bitter leaf can be used as an ingredient in herbal teas and beverages. Its unique flavor and potential health benefits make it a candidate for inclusion in herbal tea blends targeting health-conscious consumers.

Export Regulations: Regulatory bodies in some countries may establish standards and regulations for the export and import of bitter leaf and related products. Compliance with these regulations is essential for market access and commercial success.

The commercial value of *Vernonia amygdalina* makes it evident that it is essential to consider sustainable cultivation, harvesting practices, quality control, and adherence to safety standards to ensure the long-term viability of the bitter leaf industry. Additionally, collaborations between researchers, traditional healers, farmers, and entrepreneurs can contribute to the responsible and profitable commercialization of this valuable plant.

11 Future Prospects of Therapeutic Roles of *Vernonia amygdalina*

The prospects of *V. amygdalina* in therapeutic roles are promising and multifaceted. As interest in natural and plant-based remedies continues to grow, coupled with ongoing scientific research, *Vernonia amygdalina* holds great potential for contributing to various aspects of modern healthcare. Research has shown that *Vernonia amygdalina* contains a variety of phytochemicals, including flavonoids and phenolic compounds, which exhibit antioxidant and anti-inflammatory properties. These properties are important in combating oxidative stress and chronic inflammation, which are underlying factors in many chronic diseases [41]. The potential immunomodulatory effects of bitter leaf suggest its use in enhancing immune function. As immune support becomes increasingly important, bitter leaf formulations may find a place in promoting overall health and resilience. Bitter leaf has been traditionally used for its antimicrobial properties [4]. Research is ongoing to understand its effectiveness against various microorganisms, including bacteria, viruses, and parasites. This could have implications for infectious disease management. Preliminary studies have explored the antidiabetic potential of *Vernonia amygdalina*. As diabetes remains a global health concern, there is interest in developing bitter leaf-based products or therapies for blood sugar regulation. Bitter leaf is used traditionally to support liver health and detoxification. Further research into its hepatoprotective properties may lead to the development of liver support products or therapies. Some studies suggest that bitter leaf may play a role in blood pressure regulation. This could be valuable for individuals with hypertension or those at risk of high blood pressure. Bitter leaf has attracted attention for its potential anticancer properties. Investigations into the mechanisms of action of its bioactive compounds may lead to the development of novel cancer therapies or preventive strategies. Bitter leaf may be incorporated into nutraceuticals and dietary supplements targeting specific health concerns. These products could offer convenient and standardized ways to access its therapeutic benefits. The isolation and characterization of bioactive compounds from bitter leaf may pave the way for the development of pharmaceutical drugs derived from its natural compounds [82]. This could result in innovative treatments for various health conditions. Beyond its medicinal properties, *V. amygdalina* continues to be a culinary staple. Innovative chefs and food scientists may explore new ways to incorporate bitter leaf into culinary creations, promoting both its unique flavor and potential health benefits [56–58]. As the demand for bitter leaf increases, there will be a growing need for sustainable cultivation practices to ensure a consistent supply. Conservation efforts to protect wild populations of *Vernonia amygdalina* may also become essential. Collaborations between traditional healers and modern researchers can help preserve and document the rich traditional knowledge associated with bitter leaf. This knowledge transfer can inform future therapeutic developments. It is important to emphasize that the therapeutic roles of *Vernonia amygdalina* are an evolving field of study, and further research is needed to validate its efficacy and safety for specific health conditions. Collaboration between scientists, healthcare professionals, traditional healers, and local communities will be crucial in harnessing the full potential of this remarkable plant. Additionally, regulatory considerations, quality control, and standardized formulations will play a role in its future therapeutic applications.

12 Conclusion

The use of bitter leaf in ethnomedicine expresses the deep connection between nature, culture, and healthcare. The growing ethnomedicinal use reflects the wisdom passed down through generations in West and Central Africa. While its bitterness defines its taste, it is the plant's potential therapeutic properties that make it truly remarkable. From malaria treatment to immune system support and beyond, bitter leaf continues to play a vital role in the lives of many people. As modern science sheds light on its bioactive compounds and mechanisms of action, there is optimism about its potential contributions to modern healthcare. However, the complex intersection of traditional knowledge, scientific inquiry, and cultural heritage makes it essential to respect and value the lessons of the past while embracing the possibilities of the future. Therefore, the story of *V. amygdalina* is a testament to the enduring power of nature to heal, nurture, and inspire. *V. amygdalina* is a remarkable plant with a rich history deeply rooted in West Africa. Its origin within the region can be traced back to the tropical and subtropical zones where it has thrived for centuries. Bitter leaf's significance transcends its botanical characteristics, encompassing cultural, culinary, and medicinal dimensions that have been integral to the lives of West African communities. From the renowned bitter leaf soup (ofe onugbu) to its use in traditional medicine, bitter leaf has left an indelible mark on the cultural landscape of the region. Its cultivation and distribution have expanded beyond its native range, making it a valuable resource not only within West Africa but also in international markets. As awareness of the actual and potential health benefits grows, *Vernonia amygdalina* continues to be a subject of scientific inquiry, further unraveling its diverse uses and potential applications in modern medicine and nutrition.

Abstract

This chapter focuses on the phytochemical constituents, food preservative potentials, pharmacological values, safety considerations, and research needs of *Citrus aurantifolia*. The phytochemical components of *Citrus aurantifolia* offer diverse health benefits, including strengthening the immune system, supporting collagen synthesis, enhancing iron absorption, reducing inflammation (vitamin C), providing anti-inflammatory and antioxidant effects, and antiviral activities (Flavonoids). Also, the other phytochemicals, including limonoids, essential oils, alkaloids, coumarins, terpenes, and phenolics, have specific health effects. *Citrus aurantifolia* is an antioxidant and anti-inflammatory compound that may alleviate conditions like arthritis. The essential oils from the fruit can inhibit pathogenic microbes, while limonoids and coumarins possess anticancer potentials. *Citrus aurantifolia* extracts can also be used to reduce stress and manage diabetes. They also function as an analgesic, anti-cholinesterase agent, immune modulator, antidiarrheal, antiulcer, anthelmintic, and, surprisingly, a contraceptive method for some women. *Citrus aurantifolia* offers natural antimicrobial properties effective against foodborne pathogens, preserving freshness and flavor while reducing reliance on synthetic preservatives. On safety considerations, *Citrus aurantifolia* can trigger allergies, irritate the stomach, erode dental health, heighten photosensitivity, and interact with medications. Overconsumption may lead to dehydration and peel pesticide residues may transfer to the juice. Proper handling and storage are crucial. Potential research needs include comprehensive phytochemical profiling and isolation, investigation of antioxidant, antibacterial, and antifungal properties, research on bioavailability and pharmacokinetics, clinical trials for health applications, safety and toxicology studies, synergy with other compounds, and sustainable cultivation and processing methods.

1 Introduction

Ethnobotany plays a pivotal role in unraveling the traditional applications of plants for medicinal and therapeutic purposes. This field, which investigates the dynamic interplay between humans and plants, enables us to tap into the treasure trove of ancestral knowledge. Herbal medicine, a specialized branch of ethnobotany, takes full advantage of this wisdom, leveraging it to harness the therapeutic potential of various plant species [33]. By uniting the insights of traditional practices with the rigor of scientific exploration, ethnobotany safeguards the invaluable knowledge of indigenous cultures.

Indigenous communities often reside in remote environments and profoundly connect with their natural surroundings. Through generations living in harmony with the land, they have cultivated a deep understanding of the indigenous flora and the myriad ways these plants can be used. Ethnobotanical studies serve as a means of preserving this collective wisdom [22].

Herbal medicine, rooted in ethnobotanical knowledge, involves applying compounds sourced from plants for therapeutic purposes [58]. *Citrus aurantifolia* emerges as a prime exemplar of the vast potential inherent in herbal therapy. The fruit, replete with various health-enhancing phytochemical constituents, takes center stage in numerous scientific investigations.

Researchers are particularly drawn to the juice extracts of *Citrus aurantifolia* (Izah and Odubo). The juice is rich in phytochemicals that provide numerous health benefits and has become the central focus of extensive research [47]. In essence, this citrus fruit embodies the marriage of traditional herbal wisdom with contemporary scientific exploration, offering a compelling case for the potential of herbal medicine to enhance human well-being.

Citrus aurantifolia, commonly known as lime, is studied for its delightful flavor and rich composition of bioactive compounds. The antimicrobial properties of *Citrus aurantifolia*, primarily attributed to essential oils like citral and limonene, position it as a viable natural option for food preservation. These compounds exhibit efficacy in inhibiting the growth of harmful bacteria and fungi, extending the shelf life of food products without the need for synthetic preservatives [47]. Incorporating *Citrus aurantifolia* into food preservation methods aligns with the growing consumer demand for unprocessed and safer food choices.

Beyond its role in food preservation and culinary applications, *Citrus aurantifolia* offers significant pharmacological properties. It possesses Vitamin C, with its anti-inflammatory and antioxidant attributes, is valuable in addressing chronic diseases and combating oxidative stress. *Citrus aurantifolia* contains limonoids, flavonoids, and essential oils such as citral and limonene, each with a spectrum of health advantages, including anti-inflammatory, antibacterial, and even anticancer effects [39]. Limonoids, mainly, show promise in cancer prevention and treatment, making *Citrus aurantifolia* a valuable addition to a well-rounded diet. Furthermore, essential oils of *Citrus aurantifolia* have even been used in aromatherapy to alleviate stress and anxiety.

This chapter looks into the capacity of natural products to enhance human well-being, exemplifying the harmonious blend of traditional wisdom and modern science in harnessing plant-based remedies for the betterment of health.

2 Phytochemical Constituents of *Citrus aurantifolia*

Citrus aurantifolia fruit has a relatively high citric acid content in comparison to *Citrus limon* (lemon) [59, 71]. *Citrus aurantifolia* has remarkable phytochemical constituents. These natural compounds are found in various plant parts, including the fruit, leaves, and essential oils [47].

Secondary metabolites are chemical compounds produced by plants, and they play a crucial role in defending against microbial and insect attacks [46, 55–57]. These secondary metabolites encompass various categories, including flavonoids, terpenoids, phenolics, limonoids, and alkaloids, which can be further categorized into volatile and non-volatile components. In the case of *Citrus aurantifolia*, the various parts, such as stems, leaves, flowers, seeds, and fruit, serve as sources for bioactive components [45, 47]. In a review study by Indriyani et al. [45], it was revealed that flavonoids and alkaloids are found in all parts of the plant (leaf, fruit, rind, seed, stem, root, and bark), while essential oil is found in the leaf and peel; terpenoids in the leaf, peel, seed, root, and bark; limonoids in the seed; and phenolics in the leaf, fruit, rind, seed, stem, and bark. The authors further reported that the peels of citrus fruits that are not commonly used contain secondary metabolites with significant antioxidant properties compared to other plant parts.

2.1 Alkaloids

Alkaloids constitute a broad category of naturally occurring organic compounds primarily found within plant materials [13, 24, 82]. They often trigger pharmacological responses in both humans and various other organisms. The vastness of this compound class is evident from the isolation of more than 10,000 distinct alkaloids in their natural contexts, underscoring their immense diversity. Alkaloids are present in a wide array of plant species, and it is believed that plants have evolved this diversity of alkaloids as a defense mechanism against herbivores and various threats.

These alkaloids can manifest pharmacological effects when administered internally or applied externally for medicinal purposes. Among the alkaloids commonly associated with plants from the *Citrus* genus, synephrine, tyramine, and octopamine stand out as the most prevalent [98]. Alkaloids have been reported in different parts of the *Cirtus auratifolia*, including peels [40], leaves [1], and fruit juice [47]. Due to their remarkable biological properties, citrus alkaloids and glycosides exhibit significant potential as pharmacological supplements.

2.2 Phenolic Compounds

Research indicates that the presence of phenolic compounds plays a significant role in how plants respond to various pathogens, including fungi, viruses, and bacteria, thereby enhancing their ability to fend off infections [90]. In the case of *Citrus aurantifolia* fruit, the level of phenolic compounds can be influenced by the fruit's degree of maturity [45]. It's noteworthy that *Citrus aurantifolia* fruit exhibits the highest phenolic content. This content varies as the fruit matures, and the extract solvent could have an impact (positive or negative) on the phenolic compounds [45]. Singh et al. [90] reported the presence of four phenolic acids: gallic acid (26.85 g/g), tannic acid (14.27 g/g), and traces of ferulic and coumaric acids in the pulp of *Citrus aurantifolia*. The authors reported that tannic acid has the highest concentration at 26.85 g/g, while gallic acid is the predominant phenolic acid in the pulp.

2.3 Limonoids

Limonoids, a group of chemical constituents, are prevalent in citrus fruits. Citrus fruits serve as rich sources of limonoids, with relatively high concentrations of these compounds. Two distinct forms of limonoids can be identified in citrus fruits: glycosides and aglycones. Aglycones can break down into acidic mono-lactones, neutral dilactones, and neutral dicarboxylic acids [45]. Limonoid aglycones are known for their bitter flavor and insolubility in water, contributing to their nomenclature [45, 66]. Oranges, in particular, are associated with a specific chemical responsible for their bitter taste. Both limonin and nomilin are glycosides, highlighting their significance [6, 45].

Limonoids belong to the subgroup of oxygenated tetracyclic triterpenoids within the broader category of triterpenoids. These compounds possess diverse biological effects, such as anticarcinogenic, antioxidative, antibacterial, larvicidal, antimalarial, and antiviral properties, as well as hypoallergenic, anti-inflammatory, antiproliferative, antimutagenic, anticarcinogenic, antitumor, and anti-obesity and hyperglycemic effects [45]. In a study by Castillo-Herrera et al. [19], methanol and acetone were used to extract limonoids from *Citrus aurantifolia* seeds, and findings showed that methanol yielded a limonoid concentration of 1.65 mg/g, while acetone resulted in a lower concentration of 0.779 mg/g.

2.4 Terpenoids

Terpenoids are a class of chemical compounds known for their low molecular weight and volatility. They are commonly present in essential oils and play significant roles, exhibiting antibacterial properties [45]. Terpenoids exert their antibacterial effects by interacting with the cell membrane, characterized by its lipophilic nature, resulting in membrane rupture. Their hydrophobic nature makes the cytoplasmic membrane a primary target for these compounds. Authors have reported that *Citrus aurantifolia* parts contain α-pinene and d-limonene [10, 15, 18]. These two compounds are characteristic components of monoterpenes, a subgroup of terpenoids, and are known for their versatile biological functions, such as antibacterial, antiseptic, and anticancer properties [45]. *Citrus aurantifolia* is rich in various types of terpenoids, including monoterpenes, alcoholic terpenes, aldehyde terpenes, ketone terpenes, and ester terpenes [45].

2.5 Flavonoids

Flavonoids, a typical class of secondary metabolites in many plant species, are prevalent among various plants, including *Citrus aurantifolia*. Specifically, *Citrus aurantifolia* is known for its rich production of flavonoids, such as 2-phenylbenzyl-pyrone. Citrus flavonoids exhibit a wide range of biological activities, acting as antioxidants, altering enzyme functions, reducing cell proliferation, and serving as antibiotics, hypoallergenic, antiulcer, antidiarrheal, and anti-inflammatory agents [45, 67]. Flavonoids such as apigenin, rutin, kaempferol, quercetin, and nobiletin have been reported in *Citrus aurantifolia* extract [45, 67]. Additionally, flavonoids like eriocitrin and hesperidin (which possess antioxidant properties) have been reported in *Citrus aurantifolia* extract [60]. Different solvents have been used to extract flavonoids from other parts of *Citrus aurantifolia* including ethanol on the leaves [42] and methanol [67, 94].

2.6 Essential Oils

Citrus aurantifolia oil, exclusively sourced from *Citrus aurantifolia* plants, constitutes a vital essential oil. The peel of *Citrus aurantifolia* yields an essential oil composed mainly of terpenes (75%), oxygenated compounds (12%), and sesquiterpenes (3%), with steam distillation being the primary extraction method [45]. The volatile constituents of *Citrus aurantifolia* include, monoterpenes such as d-limonene and terpinene, sesquiterpenes, hydrocarbons, and their oxygenated derivatives like geranial, nonanal, neryl, and linalool, as well as aldehydes, ketones, acids, alcohols, and esters [45]. Terpenes, a subgroup within this category, play a pivotal role in the essential oil's composition [45].

Furthermore, non-volatile components responsible for various qualities include fatty acids, long-chain hydrocarbons, sterols, waxes, and limonoids. Findings indicate that the primary constituents of *Citrus aurantifolia* essential oil are d-limonene (35.98%), a-pinene (9.02%), a-terpineol (8.12%), and citral (7.49%) [45, 83, 93]. Furthermore, linalyl acetate, geraniol, citral, a-pinene, a-terpineol, felandrene, sesquiphellandrene, citronellol, neryl acetate, fencone, geranyl acetate, and farnesene could also be present in the essential oil [45]. The two primary components of *Citrus aurantifolia* essential oil are citral (which gives the distinctive citrus flavor and aroma) and limonene (which can potentially inhibit the growth of harmful bacteria and fungi, owing to its potent antibacterial properties).

2.7 Vitamin C (Ascorbic Acid)

Vitamin C, also known as ascorbic acid, is crucial in supporting the body's ability to defend against illnesses and diseases [9]. Vitamin C is pivotal in helping various physiological processes, including bolstering the immune system, stimulating collagen production to maintain healthy skin and connective tissues, facilitating the absorption of dietary iron, and acting as an effective scavenger of free radicals to mitigate inflammation and oxidative stress.

Citrus aurantifolia is esteemed for its rich vitamin C content, also referred to as ascorbic acid [88]. The quality of acid *Citrus aurantifolia* fruit is primarily determined by its vitamin C content, which varies depending on the side of the tree from which the fruit is harvested [88].

In the high and mid hills zone of Nepal, fruits from the south side had the highest levels of ascorbic acid (79.6 mg and 69.9 mg), while fruits from the central part had the lowest levels (62.8 mg and 55.1 mg) [88]. Conversely, in the Terai region, fruits from the north side had the highest concentrations (58.7 mg), and fruits from the center had the lowest concentrations (41.8 mg) [88]. Al-Aamri et al. [9] reported variations in ascorbic acid content in *Citrus aurantifolia* can be attributed to factors like the nature of the fruit, geographical origin, or the extraction solvent used. The study further showed that the amount of ascorbic acid in fruit juice was considerably lower than that in the extract. The ascorbic acid content in the juice was higher in citrus species collected from Lamjung at a higher altitude (760 m) than in those from Nawalparasi at a lower height (300–400 m) [9]. This variation may be influenced by fruit position on the tree, environmental conditions, ripeness, citrus species, variety, temperature, and other factors, as ascorbic acid levels in citrus fruits are not stable and fluctuate over time [9] (Table 1).

3 Food Preservative Potentials of *Citrus aurantifolia*

Citrus aurantifolia is a desirable option as a food preservative due to its natural antibacterial and antioxidant properties. It excels in inhibiting the growth of bacteria, guarding against foodborne illnesses, and maintaining the flavor and freshness of food products. *Citrus aurantifolia* has the ability to reduce reliance on artificial preservatives aligns with the growing consumer demand for healthier and more natural food options, driven by increasing awareness of the risks associated with synthetic preservatives. *Citrus aurantifolia* is a compelling alternative to chemical preservatives with significant potential in ensuring the safety, quality, and longevity of a diverse range of food products as we explore eco-friendly and clean-label food

Table 1 Key phytochemicals found in *Citrus aurantifolia*

Phytochemical component	Description and health benefits
Vitamin C (ascorbic acid)	Strengthens the immune system Promotes collagen synthesis for healthy skin and connective tissues Enhances dietary iron absorption It acts as a free radical scavenger, reducing inflammation and oxidative stress
Flavonoids	It can impact the characteristic color of the fruit. Offers anti-inflammatory and antioxidant effects. Exhibits antiviral activities May reduce the risk of chronic diseases like cancer and heart disease
Limonoids	Abundant in the peel and seeds Under investigation for potential anticancer effects It could impede the growth of specific cancer cells
Essential oils	It is derived from the peel and leaves and is highly fragrant Primary components include citral and limonene Citral contributes to the citrus flavor and is used in aromatherapy for stress reduction Limonene has antibacterial properties and can inhibit harmful bacteria and fungi
Alkaloids	Alkaloids can have various effects on the body depending on type and concentration
Coumarins	Coumarins are associated with anti-inflammatory and anticoagulant properties
Terpenes	Terpenes are responsible for the distinctive aroma and may have potential anticancer and anti-inflammatory actions
Phenolic	Phenolic compounds in plants offer potent antioxidant properties, reducing inflammation and lowering the risk of chronic diseases, such as heart disease

Table 2 Food preservative potentials of *Citrus aurantifolia*

Aspect	Food preservative potentials of *Citrus aurantifolia*
Natural antimicrobial properties	*Citrus aurantifolia* has inherent antimicrobial properties. This makes it valuable for food preservation and extending the shelf life of various food products
Inhibition of foodborne pathogens	*Citrus aurantifolia* has antimicrobial properties that are effective against common foodborne pathogens, including *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Enterobacter aerogenes*, *Proteus*, and *Salmonella* species
Preservation of freshness and flavor	*Citrus aurantifolia* is rich in essential oils and phytochemicals, which preserve the sensory quality of food by inhibiting microbial growth and oxidative processes
Reduced dependence on synthetic preservatives	*Citrus aurantifolia* offers a natural alternative to synthetic preservatives, aligning with the consumer trend towards minimally processed foods with clear labels
Potential applications in different food products	*Citrus aurantifolia* is versatile and adaptable, suitable for a wide range of food products

preservation solutions. Table 2 summarizes the food preservative potentials of *Citrus aurantifolia.*

3.1 Natural Antimicrobial Properties

Citrus aurantifolia possesses inherent antimicrobial properties, making it a valuable component in food preservation [47]. Extensive research has focused on the anti-bacterial capabilities of essential oils derived from this *Citrus aurantifolia* species, such as citral and limonene [45]. These essential oils exhibit potent antimicrobial effects by disrupting various organisms' cellular membranes and metabolic processes. This attribute renders *Citrus aurantifolia* an ideal choice for extending the shelf life of diverse food products, thereby lowering the risk of contamination and spoilage.

A study by Olaniran et al. [75] yielded significant findings regarding using *Citrus aurantifolia* juice as a preservative. The study demonstrated that when *Citrus aurantifolia* juice was applied at a concentration of 4%, it exhibited the highest bacteriostatic and fungistatic efficacy. The authors concluded that *Citrus aurantifolia* juice was an effective preservative and demonstrated antimicrobial properties. This suggests that *Citrus aurantifolia* juice has the potential to be used as an alternative to chemical preservatives, offering a natural and effective means of preserving food products.

3.2 Inhibition of Foodborne Pathogens

Foodborne pathogens, bacteria, parasites, and viruses that can induce illness when ingested via contaminated food substantially threaten food safety and public health. Fortunately, several species of plants and plant-derived compounds harbor essential antimicrobial properties that can be harnessed to inhibit the proliferation of these diseases. *Citrus aurantifolia*'s antimicrobial properties make it effective in inhibiting the growth of common foodborne pathogens, including *Staphylococcus aureus, Escherichia coli, Pseudomonas aeruginosa, Enterobacter aerogenes, Proteus,* and *Salmonella* species [47]. Therefore, incorporating *Citrus aurantifolia* extracts or essential oils into food products can help reduce the risk of foodborne illnesses, ensuring food safety for consumers.

3.3 Preservation of Freshness and Flavor

Citrus aurantifolia exhibits the potential to serve as a natural preservative, capable of preserving the flavor and freshness of food. This citrus fruit is rich in essential oils and phytochemicals, both of which contribute to protecting the sensory quality of food products by inhibiting microbial growth and oxidative processes. This quality is particularly advantageous in maintaining the aroma, taste, and texture of a diverse range of culinary items, from sauces and dressings to baked goods and dairy products [49].

3.4 Reduced Dependence on Synthetic Preservatives

The widespread use of artificial chemical preservatives in the food industry has raised concerns about potential adverse health effects. In response, *Citrus aurantifolia* offers a natural alternative to synthetic preservatives, aligning with the increasing consumer preference for minimally processed food products with clear labels. By reducing our dependence on artificial preservatives, *Citrus aurantifolia* contributes to creating healthier and more natural food choices, reflecting the broader trend of favoring unprocessed options.

3.5 Potential Applications in Different Food Products

Citrus aurantifolia holds promise as a versatile food preservative suitable for a wide range of food products. Its adaptability allows for diverse applications, including beverages such as zobo [49], condiments, sauces, baked goods, dairy items, and even the preservation of fruits and vegetables in their fresh state. This adaptability makes it a valuable asset, benefiting businesses seeking natural and safe food preservation methods and consumers seeking such options.

4 Pharmacological Values of *Citrus aurantifolia*

Plants have played an indispensable role in managing and treating an array of conditions, encompassing peptic/gastric ulcers, malaria, anemia, diarrhea, diabetes, obesity, cancer, inflammation, hypertension, rheumatism, microbial infections, and a plethora of other ailments. One such plant that stands out is *Citrus aurantifolia*.

Kawaii et al. [61] have reported that all parts of *Citrus aurantifolia*, including the stem, leaves, roots, flowers, and fruit, can be employed to treat microbial infections. Different reviews on the traditional uses of *Citrus aurantifolia* highlight its antibacterial, antidiabetic, antifungal, antihypertensive, anti-inflammatory, anti-lipidemia, antioxidant, anti-parasitic, and antiplatelet activities [71]. Additionally, it has been documented for its efficacy in treating cardiovascular, hepatic, osteoporosis, and urolithiasis diseases, as well as its potential as a fertility promoter [36, 74, 86, 96, 100].

The juice and essential oil of *Citrus aurantifolia* have found widespread application in the pharmaceutical, food, and cosmetic industries due to their medicinal properties and fragrant characteristics. Aibinu et al. [6] have reported that when the juice is combined with sugar and palm oil or honey, it forms a potent cough-relieving mixture, further underscoring the versatile utility of this plant in healthcare and well-being. This section focuses on the pharmacological values of *Citrus aurantifolia* and its potential contributions to human health (Table 3).

Table 3 Pharmacological properties and benefits of *Citrus aurantifolia*

Pharmacological property	Properties and uses of *Citrus aurantifolia*
Antioxidant	*Citrus aurantifolia* is a rich source of vitamin C, offering antioxidant protection against oxidative stress and free radical damage, reducing the risk of chronic diseases
Anti-inflammatory	Phytochemicals, including flavonoids, in *Citrus aurantifolia* exhibit anti-inflammatory effects, potentially alleviating symptoms in conditions like arthritis and inflammatory bowel disease
Antimicrobial	Essential oils in *Citrus aurantifolia*, such as citral and limonene, have strong antimicrobial properties and are effective against many pathogenic bacteria and fungi
Anticancer	The limonoids and coumarins in *Citrus aurantifolia* have demonstrated anticancer potential by inhibiting the growth of various cancer cells
Stress and anxiety	Essential oils from *Citrus aurantifolia* are used in aromatherapy to reduce stress and anxiety
Antidiabetic	*Citrus aurantifolia* extracts can be used in managing diabetes by modulating glycogen metabolism
Anti-plasmodial	*Citrus aurantifolia* leaf extracts have anti-plasmodial activity, potentially contributing to the treatment of malaria
Analgesic	*Citrus aurantifolia* leaves have been found to alleviate pain without adverse effects, offering a natural analgesic option
Anti-cholinesterase	*Citrus aurantifolia* methanol extracts exhibit anti-cholinesterase activity by inhibiting acetylcholinesterase and butyrylcholinesterase (BChe), potentially impacting cognitive health
Anti-modulatory	*Citrus aurantifolia* juice has been shown to modulate the immune response
Anti-diarrhea	*Citrus aurantifolia* has been traditionally used to alleviate diarrhea, with bioactive compounds potentially reducing symptoms of indigestion.
Antiulcer	Specific components of *C. aurantifolia*, such as citral and 4-hexen-3-one, have demonstrated inhibitory effects on *Helicobacter pylori* growth, which could be valuable in addressing ulcer-related conditions
Anthelmintic	*Citrus aurantifolia* peel constituents have shown the ability to inhibit the reproduction of parasites such as certain helminths
Antifertility	Some women have used *Citrus aurantifolia* juice as a contraceptive method due to its acidity and phytochemical constituents that can destroy human sperm cells

4.1 Antioxidant Properties

One of the critical pharmacological values of *Citrus aurantifolia* lies in its antioxidant properties. The fruit is an abundant source of vitamin C, a well-known antioxidant that helps combat oxidative stress and free radical damage. These harmful molecules are implicated in various chronic diseases, including cardiovascular disease, cancer, and aging. Regular consumption of *Citrus aurantifolia* can help protect cells and tissues from oxidative damage, reducing the risk of these diseases.

Numerous studies have highlighted using essential oils derived from *Citrus aurantifolia* leaves as natural antioxidants [71], particularly in the pharmaceutical and food industries, owing to their relatively safe toxicological profiles. In a study by Al-Aamri et al. [9], it was found that 31 essential oils sourced from citrus fruits exhibited superior antioxidant properties compared to Trolox. Authors have documented that the presence of D-limonene in both the leaves and rind of *Citrus aurantifolia* accounts for its antioxidant properties and the ability to combat cell damage induced by free radicals [39, 65, 81]. Furthermore, the flavonoids found in *Citrus aurantifolia* have demonstrated antioxidant and anticancer attributes by inhibiting cell division in cancerous cells, as noted in the research conducted by Abubakar et al. [3].

4.2 Anti-inflammatory Effects

Inflammation is a natural defense mechanism in the human body designed to eliminate or restrict the spread of harmful agents. While it is a typical response to tissue injury, it can become uncontrolled in chronic autoimmune conditions like rheumatoid arthritis, Crohn's disease, and allergic reactions such as asthma and anaphylactic shock [8, 84]. The phytochemical constituents of *Citrus aurantifolia*, such as flavonoids, have demonstrated anti-inflammatory properties [71]. Inflammation is a central component of many chronic conditions, including arthritis and inflammatory bowel disease. The natural compounds in *Citrus aurantifolia* can help mitigate inflammation, relieving individuals suffering from these ailments. *Citrus aurantifolia* leaves and rind contain D-limonene as a significant constituent, which has been reported to reduce inflammatory markers associated with conditions characterized by chronic inflammation, such as osteoarthritis.

4.3 Antimicrobial Activity

Plant has emerged as a source of new antimicrobial probability due to their ability to inhibit gram-positive and harmful microbes [50–54]. The essential oils found in *Citrus aurantifolia*, particularly citral and limonene, exhibit potent antimicrobial properties. These compounds have traditionally been used to inhibit the growth of pathogenic bacteria and fungi. As a result, *Citrus aurantifolia* has applications in the field of pharmacology as a potential source of natural antimicrobial agents. This can be particularly valuable when antibiotic resistance is a growing concern.

Numerous reports have highlighted the potent antimicrobial properties of *Citrus aurantifolia* juice against a broad spectrum of pathogenic microorganisms (bacterial and fungal) [7, 31, 32, 63, 77, 87, 95, 97], including *V. cholerae*, *S. aureus*, *K. pneumonia*, *S. pyogenes*, *Actinobacillus* sp., *Citrobacter* sp., *Shigella* sp., as documented by Jayana et al. [59] and Adebayo-Tayo et al. [4]. The effectiveness of this antimicrobial activity can be attributed mainly to the complex chemical composition of the juice, which encompasses various chemical classes such as terpenes, aldehydes, alcohols, esters, phenols, ethers, and ketones, as highlighted by Al-Aamri et al. [9]. Moreover, extracts derived from *Citrus aurantifolia* fruit have been found to exhibit antimicrobial properties against microorganisms like *Candida albicans*, *Aspergillus niger*, and *Aspergillus fumigatus*, as reported by Aibinu et al. [6] and Abubakar et al. [2].

In addition to the fruit extracts, the ethanolic extracts obtained from *Citrus aurantifolia* leaves have demonstrated bactericidal effects against a range of bacterial species, including *Bacillus subtilis*, *Escherichia coli*, *Salmonella*, and *Streptococcus feacalis*, as observed by Oboh and Abulu [73].

These antimicrobial properties are attributed to bioactive phytochemicals in different parts of *Citrus aurantifolia*. Flavonoids, in particular, have been recognized for their influence on arachidonic acid metabolism, enabling them to combat a wide array of bacteria by forming complexes with extracellular and soluble proteins within bacterial cell walls, as explained by Adebayo-Tayo et al. [3].

4.4 Anticancer Potential

Cancer is a primary global public health concern, the second leading cause of death. In the United States in 2015, there were approximately 1.6 million new cancer cases, resulting in roughly 500 thousand cancer-related deaths [89]. Perhaps one of the most exciting pharmacological values of *Citrus aurantifolia* is its potential for cancer prevention and treatment [71]. The limonoids in this citrus fruit have shown anticancer properties by inhibiting the growth of cancer cells. These compounds may help reduce the risk of cancer development and support treating various cancer types. An intriguing study by Patil et al. [78, 79, 80] revealed the anticancer potential of *Citrus aurantifolia* fruit extract. They found that at a concentration of 100 μg/ml, this extract inhibited the growth of human colon SW-480 cancer cells by an impressive 78% after 48 h of exposure. This remarkable effect can be attributed to the fruit extract's substantial amounts of limonene and dihydrocarvone. Additionally, when a 25 μM concentration of *Citrus aurantifolia* peel extract was used, it displayed the capability to inhibit the growth of colon SW-480 cancer cells in humans by 67% after 72 h of exposure. This inhibition is attributed to three key coumarins: 5-geranyloxy-7-methoxycoumarin, *Citrus aurantifolia* tin, and isopimpinellin found in the peel extract.

Patil et al. [78, 79] reported that 100 μg/ml of *Citrus aurantifolia* juice extract effectively halted approximately 73–89% of pancreatic Panc-28 cancer cell growth in humans after 96 h of exposure. This remarkable effect can be attributed to limonoid substances, such as limonexic acid, isolimonexic acid, and limonin in the juice extract. Meanwhile, *Citrus aurantifolia* seeds extract exhibited the ability to stop the growth of pancreatic Panc-28 cancer cells in humans with an inhibitory concentration of 50% (IC50) ranging from 18 to 42 μM after 72 h of exposure. This inhibition was achieved through compounds like limonin, limonexic acid, isolimonexic acid, β-sitosterol glucoside, and limonin glucoside.

In another study, Gharagozloo et al. [35] reported that *Citrus aurantifolia* fruit juice extract from Iran, at concentrations ranging from 125 to 500 μg/ml, effectively inhibited the growth of breast MDA-MB-453 cancer cells after 24 h of exposure. Furthermore, Adina et al. [4] found that a concentration of 6 and 15 μg/ml of *Citrus aurantifolia* peel extract from Indonesia was capable of inhibiting the growth of breast MCF-7 cancer cells, targeting different phases of the cell cycle, specifically G1 and G2/M, respectively, after 48 h of exposure.

Additionally, Castillo-Herrera et al. [19] reported that limonin extract derived from *Citrus aurantifolia* seeds in Mexico displayed remarkable inhibitory effects on the growth of L5178Y lymphoma cells, with an IC50 ranging from 8.5 to 9.0 μg/ml. These findings underscore the promising potential of *Citrus aurantifolia* extracts in the fight against various types of cancer.

4.5 Stress and Anxiety Relief

Anxiety, a common mental health condition often associated with comorbidity, poses a significant psychological, social, and economic burden and an elevated risk of physical illness [62, 76]. The pharmacological treatment of anxiety and mood disorders includes drugs like beta blockers, benzodiazepines, monoamine oxidase inhibitors, tricyclic antidepressants, and selective serotonin reuptake inhibitors. Still, they have notable limitations, such as comorbid psychiatric disorders, acute poisoning, and addiction [91]. The essential oils from *Citrus aurantifolia* are often used in aromatherapy for their calming and stress-reducing effects. These essential oils can be explored in pharmacology as a natural alternative to pharmaceutical anxiolytics. The aroma of *Citrus aurantifolia* can help alleviate stress and anxiety, promoting mental well-being. Furthermore, Guzmán et al. [37] reported that in China, Brazil, and Mexico, the fruit peel and juice of *Citrus aurantifolia* have been employed as tranquilizers and anxiolytic medications.

4.6 Antidiabetic Properties

Diabetes mellitus, a metabolic disorder characterized by elevated blood sugar levels, stems from issues with insulin secretion or action, affecting the metabolism of carbohydrates, fats, and proteins [23]. Type 1 diabetes results from the autoimmune destruction of pancreatic β-cells, necessitating external insulin supplementation for patients to maintain their well-being [20]. Conversely, Type 2 diabetes is associated with dysfunctional insulin levels that impair glucose uptake.

Type 2 diabetes, which can manifest as a chronic or mild condition, can eventually lead to vascular complications, dysfunction, and an increased risk of coronary artery and peripheral vascular diseases. This ailment is a pressing global public health concern, as the World Health Organization reports that approximately 422 million individuals have diabetes, with around 90% of these cases being Type 2 diabetes [44].

Ethnobotanical research has revealed a notable preference for extracts from the Rutaceae family in diabetes management. For instance, the essential oil of *Citrus aurantifolia* has shown potential in inducing apoptosis in pancreatic cell lines and reducing hyperglycemia in alloxan-induced rats. Furthermore, it may possess antidiabetic properties through its ability to modulate glycogen metabolism [44]. Narang and Jiraungkoorskul [71] have reported the antidiabetic potential of *Citrus aurantifolia*.

4.7 Antidepressant

In the current era, mental and neurological disorders stand out as one of the foremost global health concerns. Among these, anxiety and mood disorders are particularly prevalent and carry a heavy psychological and socio-economic burden, increasing the risk of physical ailments. Conventional medications for anxiety and mood disorders include beta-blockers, benzodiazepines, monoamine oxidase inhibitors, tricyclic antidepressants, and selective serotonin reuptake inhibitors. However, these medications have limitations, such as the potential for co-existing psychiatric disorders, acute toxicity, drug interactions, and the development of physical dependence, leading to intolerable side effects [91]. As a result, there has been a quest for alternative and innovative treatments, and promising results have emerged from using plants. For instance, Chinese, Brazilians, and Mexicans have employed the fruit peel and juice extract of *Citrus aurantifolia* as tranquilizers and anxiolytic therapies. At the same time, the leaves can be used as tranquilizers. Additionally, the flowers of *Citrus aurantifolia* are used in Mexico to alleviate anxiety and nervousness. In some parts of Latin America and Africa, an infusion of dried *Citrus aurantifolia* flowers is a nerve-soothing sedative [91].

4.8 Anti-plasmodial

Turning to anti-plasmodial treatments, malaria, primarily transmitted through the bite of female Anopheles mosquitoes carrying *Plasmodium falciparum*, poses a significant global health threat. The parasite is introduced into human red blood cells during the mosquito's bite, leading to a malarial infection once it multiplies in the bloodstream. Malaria claims the lives of a staggering live in many region of the word with Africa being the most endemic region of the diseases [17, 26, 28, 48, 72, 101]. Furthermore, malaria kills 235,000 to 639,000 individuals worldwide annually [43, 70, 99]. Furthermore, resistance to conventional antimalarial drugs has been documented, a significant breakthrough emerged from Chinese researchers who discovered the efficacy of Artemisinin (Qinghao), a traditional Chinese medicine, in combatting drug-resistant forms of malaria infection [30]. In Africa, *Citrus aurantifolia* has been employed to treat various illnesses, with the fruit juice being recognized for its ability to alleviate swelling resulting from mosquito bites. Furthermore, Ettebong et al. [30] have reported that *Citrus aurantifolia* leaf extract exhibits substantial anti-plasmodial activity in vivo.

4.9 Analgesic

The management of analgesic conditions often necessitates synthetic molecules, which, unfortunately, can lead to various adverse effects on the body. These effects may vary in severity and impact critical systems like the kidneys and digestive tract. Plant-based treatments have gained attention as an alternative approach to addressing analgesic ailments [21]. In a recent study by Al-Snafi [12], it was found that administering an extract of *Citrus* species to mice effectively alleviated their analgesic condition. Significantly, this natural remedy exhibited no adverse effects and did not result in mortality among the test subjects.

4.10 Anticholinesterase Activity

Alzheimer's disease is a progressive neurological disorder characterized by cognitive deficits and behavioral abnormalities. It has been well-documented that the progression of Alzheimer's disease is linked to the presence of reactive oxygen species, emphasizing the importance of using antioxidants to reduce disease advancement and minimize neuronal degeneration. Additionally, a cholinergic deficit resulting from basal forebrain degeneration calls for strategies to enhance acetylcholine production – an essential neurotransmitter for cognitive functions – to restore cognitive deficits. This approach is known as the cholinergic hypothesis [14, 85, 92].

Notably, *Citrus aurantifolia* methanol extracts in n-hexane fractions have significant anti-cholinesterase effects. This effect is achieved through the inhibition of acetylcholinesterase (AChe) and butyrylcholinesterase (BChe), as demonstrated in plasma assays, as reported by Loizzo et al. [67].

4.11 Anti-modulatory Activity

Citrus aurantifolia, commonly known as lime, has been found to exhibit immune-modulatory activity, as demonstrated in a trial utilizing mitogen-activated culture mononuclear cells. In this study conducted by Gharagozloo and Ghaderi [34], the juice of *Citrus aurantifolia* was assessed for its impact on the immune response.

The results indicated that the application of 250 and 500 micrograms of *Citrus aurantifolia* juice led to a significant inhibition of the proliferation of phytohemagglutinin-activated mononuclear cells. This suggests that *Citrus aurantifolia* juice can modulate the immune response, potentially by regulating the activation and proliferation of immune cells.

This finding underscores the potential immunomodulatory properties of *Citrus aurantifolia*, which may have implications for its use in various contexts, such as supporting immune health or developing therapies to regulate immune responses. Further research and exploration of these properties could provide valuable insights into the potential applications of *Citrus aurantifolia* juice in immunology and health.

4.12 Anti-diarrhea Activity

Diarrhea is a condition that can pose a significant threat to patients, potentially leading to severe pain and, in extreme cases, even death if it remains untreated or is inadequately managed [25, 52]. While diarrhea can affect individuals of all age groups, it is especially concerning in infants and children, necessitating special attention. Several factors are known to be direct or indirect triggers for diarrhea, including bacterial and viral infections, allergies, malabsorption issues, and food poisoning [25].

Citrus aurantifolia has been traditionally used to support digestive health. Its bioactive compounds may aid in reducing symptoms of indigestion and promoting overall gastrointestinal well-being. This pharmacological value is particularly relevant in digestive disorders and conditions. He et al. [41] conducted a study revealing that pre-treatment with dried fruits of *Citrus aurantifolia* significantly alleviated 2,4,6-trinitrobenzene sulfonic acid-induced diarrhea in rats. This finding suggests a potential anti-diarrhea effect associated with *Citrus aurantifolia*, offering promise for managing this distressing condition.

4.13 Antiulcer

Helicobacter pylori, a prominent pathogen associated with developing various ulcer-related conditions such as gastritis, peptic ulcers, gastric adenocarcinoma, and mucosa-associated lymphoid tissue lymphoma, has become widely prevalent in the human population [11, 27]. This is primarily due to its high level of antibiotic resistance, which poses a significant challenge to the effective treatment and eradication of *Helicobacter pylori*. Consequently, there is a growing need for new alternatives to address this issue.

In regions with a high prevalence of *Helicobacter pylori*, citrus fruit has been reported to reduce the occurrence of gastric cancer [16, 64]. Lee et al. [64] further demonstrated that specific components of *Citrus aurantifolia*, such as citral and 4-hexen-3-one, can inhibit the growth of triple drug resistant *Helicobacter pylori* strains. Notably, the 4-hexen-3-one constituent exhibited a more substantial inhibitory effect on the urease activity of triple drug resistant *Helicobacter pylori* strains as its concentration increased, indicating the potential of these citrus components as a promising approach in addressing *Helicobacter pylori*-related conditions.

4.14 Anthelmintic

Helminthosis is a parasitic infection known for its detrimental impact on animal health, causing growth impairment, reducing survival rates, hindering reproductive performance, and eventually leading to the death of infected animals. This poses a substantial economic burden on humans, especially livestock farmers. Currently, chemotherapy is the most effective means of treating helminthosis, but it has significant cost implications and raises concerns regarding developing resistant helminth parasites.

While the fruit peels of *Citrus aurantifolia* have gained recognition for their medicinal properties in managing various illnesses and infections, they are rarely included in the diet of livestock [29, 91]. Enejoh et al. [29] conducted a study revealing that the constituents found in *Citrus aurantifolia* peel exhibit a noteworthy ability to inhibit the hatching of *Heligmosomoides bakeri* eggs, a trichostrongyloid parasite naturally occurring in wild mice. Additionally, these constituents were effective in killing the helminth larvae in vitro. This suggests a potential role for *Citrus aurantifolia* peel in combating helminth infections and highlights the significance of exploring this natural remedy in livestock health and management.

4.15 Antifertility

The ability to reproduce offspring is a fundamental and vital aspect of life. However, various health conditions can interfere with this function. When individuals face challenges in their ability to conceive and reproduce, it can give rise to multiple concerns and potentially lead to additional health-related issues, such as anxiety and depression. Interestingly, reports have shown that infertility can also be induced intentionally by using various plant extracts by individuals who do not wish to have children. For example, the juice of *Citrus aurantifolia*, commonly known as *Citrus aurantifolia*, has been employed by African women as an alternative contraceptive method, along with douching, to prevent pregnancy and sexually transmitted diseases [74].

Furthermore, in vitro studies conducted by Okon and Etim [74], Hair et al. [38], Masud et al. [69], and Longo et al. [68] have unveiled antifertility findings regarding the juice of *Citrus aurantifolia*. This citrus juice can destroy human immunodeficiency virus (HIV) and human sperm cells. This effect is attributed to the juice's high acidity and phytochemical constituents. These studies shed light on the potential applications and consequences of using *Citrus aurantifolia* juice in the context of antifertility and protection against certain health risks.

In summary, *Citrus aurantifolia* offers a range of pharmacological values due to its rich composition of bioactive compounds. Its antioxidant, anti-inflammatory, antimicrobial, and anticancer properties make it a valuable addition to pharmacological research in preventing and treating chronic diseases. Additionally, its stress-relieving and digestive health benefits contribute to its potential role in enhancing overall well-being. As we continue to explore the health benefits of natural products, *Citrus aurantifolia* stands as a promising candidate in the field of pharmacology for its diverse and potent pharmacological values.

5 Safety Considerations of *Citrus aurantifolia* Juice Extracts

Even though juice extracts from *Citrus aurantifolia* can enhance culinary capabilities and offer potential health benefits, it is essential to be aware of the associated risks. Some of the related risks of *Citrus aurantifolia* are as follows:

allergies, stomach sensitivity, dental health, photosensitivity, medication interactions, hydration, etc. (Table 4). Therefore, achieving a safe and enjoyable experience hinges on consuming these extracts in moderation and making well-informed choices.

6 Research Needs on the Juice Extracts of *Citrus aurantifolia*

Citrus aurantifolia juice extracts hold significant promise as a valuable natural resource with various potential health benefits. To harness research, it is essential to encompass the identification and isolation of bioactive compounds, followed by comprehensive clinical trials and safety assessments. Researching this will advance the understanding of the natural compounds in plants and pave the way for innovative preventive and therapeutic applications in nutrition, medicine, and food science. Table 5 shows the potential research needs on the juice extracts of *Citrus aurantifolia.*

Table 4 Safety considerations of *Citrus aurantifolia* juice extracts

Consideration	Safety considerations of *Citrus aurantifolia* juice extracts
Allergies	*Citrus aurantifolia* can trigger allergic reactions, ranging from mild skin rashes to severe anaphylaxis. Therefore, individuals with citrus allergies should use extreme caution when consuming *Citrus aurantifolia* juice
Stomach sensitivity	*Citrus aurantifolia* juice contains high acidity, which can irritate the stomach and digestive tract, potentially causing discomfort, heartburn, or acid reflux. Therefore, those with digestive disorders should consume *Citrus aurantifolia* juice cautiously
Dental health	The acidity in *Citrus aurantifolia* juice can erode tooth enamel, increasing the risk of dental issues like tooth sensitivity and cavities. Therefore, rinsing with water after consumption is advised, and avoid brushing teeth immediately afterward
Photosensitivity	*Citrus aurantifolia* juice may contain compounds that make the skin more sensitive to sunlight, potentially leading to phytophotodermatitis and skin damage when exposed to the sun. Therefore, caution must be exercised when applying *Citrus aurantifolia* juice to the skin or ingesting it before sun exposure
Medication interactions	*Citrus aurantifolia* juice can interact unfavorably with certain medications, altering their effectiveness or causing side effects
Hydration and electrolytes	*Citrus aurantifolia* juice has a natural diuretic effect due to its potassium content, which can lead to dehydration and electrolyte imbalances when consumed excessively
Pesticide residues	*Citrus aurantifolia* peels may carry pesticide residues that can transfer into the juice from the soil
Safe handling and storage	Proper handling and storage practices are essential for food safety

Table 5 Research needs on the juice extracts of *Citrus aurantifolia*

Research area	Potential research needs on the juice extracts of *Citrus aurantifolia*
Phytochemical profiling and isolation	Comprehensive profiling of phytochemicals in *Citrus aurantifolia* juice extracts Isolation and purification of these compounds to understand their specific health contributions
Antioxidant effects	Research on how *Citrus aurantifolia* reduces oxidative damage and inflammation
Antibacterial and antifungal activities	Studying the extent to which *Citrus aurantifolia* juice extracts inhibit the growth of pathogenic microorganisms – potential applications as natural food preservation and antibiotic alternatives
Bioavailability and pharmacokinetics	Research on how the body absorbs, distributes, metabolizes, and eliminates the bioactive constituents of the juice. Essential for optimal dosage and administration
Clinical trials and health uses	Conducting well-designed clinical trials to assess the effectiveness of *Citrus aurantifolia* juice extracts in preventing and treating conditions such as cancer and chronic inflammatory disorders
Studies on the product safety and toxicology	Comprehensive toxicology studies to establish safe consumption dose levels for *Citrus aurantifolia* juice extracts
Synergistic effects with other components	Study how *Citrus aurantifolia* juice extracts interact with other natural compounds and medications
Research into sustainable cultivation practices and processing technologies	Research into sustainable cultivation methods and processing technologies to preserve the integrity of bioactive components and ensure a consistent supply of high-quality raw materials

7 Conclusion

Investigating *Citrus aurantifolia* and its juice extracts reveals a multifaceted natural resource with significant potential in nutrition, medicine, and food preservation. The phytochemical constituents present in *Citrus aurantifolia* contribute to its distinct properties, and research in several areas is vital to unlock its full potential. Firstly, the phytochemical profiling and isolation of specific compounds, such as vitamin C, flavonoids, and essential oils, form a fundamental research need. Understanding the bioactive compounds in *Citrus aurantifolia* enables us to harness their potential in various applications. Moreover, the antioxidant properties of *Citrus aurantifolia* juice extracts are a noteworthy avenue of research. Exploring these properties in the context of oxidative stress-related diseases has promising implications for preventive and therapeutic measures. These extracts' antimicrobial and antifungal activities are another significant area of study. These natural extracts show potential for use as food preservatives and alternatives to synthetic antibiotics. Bioavailability and pharmacokinetics studies are essential to optimize the health benefits of *Citrus aurantifolia*. Understanding how the body processes these compounds ensures effective administration. To validate the practical health applications of *Citrus aurantifolia* juice extracts, transitioning from in vitro and animal studies to well-designed clinical trials is necessary. This research can help us unlock their potential in preventing and managing various health conditions. Additionally, safety and toxicology studies are crucial to establishing the safe dosage levels of these extracts, assuring consumers and healthcare providers of their safety. Considering potential synergistic effects with other compounds, particularly in combination therapy, offers exciting prospects for enhancing therapeutic outcomes. Finally, sustainable cultivation and efficient processing methods should be researched to ensure a consistent supply of high-quality raw materials while maintaining the integrity of the bioactive compounds.

Contents

Abstract

Neurodegenerative disorders, such as Alzheimer's disease, lead to a gradual and irreversible loss of neurons and brain function, resulting in progressive dementia characterized by disoriented plaques and neurofibrillary tangles composed of beta-amyloid and hyperphosphorylated tau proteins, respectively. Currently, there is no permanent treatment for these disorders. However, herbal plants and formulations, along with certain research findings, have reported the potential therapeutic use of rosemary leaves to mitigate these conditions more pleasantly. *Rosmarinus*

officinalis Linn., commonly known as rosemary, holds significant economic importance and is often used as a flavor enhancer in soups. In the field of phytomedicine, this herb is gaining recognition as researchers investigate not only its unique taste and aroma but also the various health benefits of its constituents when extracted. The phytotherapeutic components of rosemary, such as rosmarinic acid and other derivatives found in its essential oils, including caffeic acid, p-coumaric acid, rosmanol, carnosol, carsonic acid, 4-hydroxybenzoic acid, beta-amyrin, oleanic acid, and urosolic acid, offer numerous advantages. These constituents possess anti-memory loss properties and various other health benefits, primarily due to their inhibitory effects on factors contributing to memory problems. This chapter sheds light on the impact of *Rosmarinus officinalis Linn.*, specifically rosemary leaves and its essential constituents, on health benefits. These benefits include its potential as an anti-memory loss agent, possibly attributed to the presence of flavonoids, triterpenoids, diterpenoids, and antioxidants. The review chapter critically examines the protective systematic effect this natural medicinal plant produces, such as being a stimulus as well as a protective agent that promotes healthier brain functionality.

1 Introduction

Phytochemistry is the branch of chemistry that focuses on the study of the chemical compounds found in plants, particularly those with medicinal properties. It involves the identification, isolation, characterization, and analysis of the various chemical constituents present in plant species. Phytochemistry plays a crucial role in understanding the therapeutic potential of medicinal plants and in developing herbal medicines.

Herbal medicine, also known as phytotherapy or botanical medicine, is a traditional or alternative healthcare system that utilizes medicinal plants and their extracts to prevent, alleviate, or treat various health conditions [3, 4, 24, 48]. It relies on the knowledge of the phytochemicals present in plants and their pharmacological effects on the human body. Herbal medicine has been practiced for centuries in different cultures and is still widely used today as a complementary or alternative approach to conventional medicine.

Medicinal plants are plants that contain bioactive compounds with therapeutic properties [45–47, 50–52]. These plants have been used for centuries in traditional medicine systems around the world to treat a wide range of ailments and diseases. Medicinal plants serve as the primary source of ingredients for herbal medicines. They are valued for their natural compounds, which can have anti-inflammatory, antioxidant, analgesic, antimicrobial, and other beneficial effects on health [40–44].

Therefore, phytochemistry delves into the chemical composition of plants, herbal medicine employs medicinal plants and their extracts for health purposes, and medicinal plants are the natural sources of bioactive compounds used in herbal remedies and traditional medicine systems. These fields are interconnected and contribute to our understanding of the healing potential of the natural world.

Rosemary, scientifically known as "Rosmarinus officinalis Linn.," is an evergreen shrub known for its aromatic and medicinal properties. It has received approval from the European Union [8] and is commonly found growing around the Mediterranean region. This plant is classified under the Lamiaceae plant family and is characterized by slender, needle-like leaves on erect woody stems. The leaves are green on the upper side and white underneath. Rosemary branches are firm with a cracked bark, and the woody stems are brown and square-shaped. It produces small light blue to white flowers in a distinctive inflorescence, typically blooming from late spring to early summer.

Various parts of the rosemary plant, including its leaves, flowers, and twigs, are processed to yield phytonutraceuticals [75]. Rosemary is cultivated in different regions worldwide and holds multiple uses. It is a staple in Mediterranean cuisine, used to make tea, incorporated into cosmetology products, and has a history in traditional and contemporary medicine for treating issues such as colds, coughs, and rheumatoid problems. Given its diverse applications, exploring the neuron-protective properties of rosemary leaves as a potential treatment for memory loss associated with neurodegenerative disorders is essential.

Numerous epidemiological studies have shown that a diet rich in polyphenols from rosemary leaves (*Rosmarinus officinalis* L.) can reduce the risk of Alzheimer's disease, a prevalent form of dementia in elderly individuals [7, 60, 86]. Among the various phyto-constituents found in *Rosmarinus officinalis*, compounds like caffeic acid, rosmarinic acid, oleanolic acid, urosolic acid, rosmanol, carnosol, carsonic acid, piccrosalvin, beta-amyrin, and rosmarinic acid stand out as promising anti-memory agents. These compounds appear to mitigate the progressive development of dementia by inhibiting alpha-beta aggregation and reducing synaptic toxicity in vitro [64].

According to Farmanfarma et al. [27], the accumulation of certain proteins, particularly in developed countries, has been linked to the development of brain cancer, accounting for approximately 3% of all cancer types, especially within the category of nervous system malignancies. Among these, 48% are classified as primary tumors in the central nervous system, with about 57% falling into the category of glioblastoma, a type of glioma that predominantly affects males between the ages of 75 and 84 and is also potentially linked to Alzheimer's disease. Extracts from *Rosmarinus officinalis* L. have been utilized to counteract these effects.

Reports by Sayorwan et al. [76] and Czajkowski and Nazaruk [19] regarding essential oil extracts from rosemary herb highlight their therapeutic benefits in slowing memory loss and preventing Alzheimer's disease, supported by evidence-based research. Sayorwan et al. [76] demonstrated that inhaling essential oils extracted from the Rosmarinic acid found in rosemary leaves via the olfactory nerve had a significant impact on brainwave activity. This stimulation influenced mood states and cognitive processes, enhancing alertness and mental activity, ultimately leading to reduced sleepiness, increased productivity, and a sense of refreshment.

Furthermore, Czajkowski and Nazaruk [19] reported that Rosmarinic acid from rosemary leaves had protective properties against neurotoxicity induced by the deposition of tau proteins and beta-deposits in the brain. This therapeutic potential of Rosmarinic acid had a gradual effect on the development of dementia, a prevalent form of neurodegenerative disorder characterized by the aggregation of tau proteins and beta-amyloid in the brain.

Regarding gliomas, which are highly toxic brain tumors, the use of rosmarinic acid as a treatment therapy for glioblastoma has been reported but has shown limited success in preventing neurological dysfunction and death [27]. Frontotemporal disorders, resulting from damage to neurons in the frontal and temporal regions of the brain, manifest as emotional difficulties, communication problems, and impaired working and walking abilities.

In a study conducted by Rasoolijazi et al. [71], the anti-memory effects of rosemary leaves were assessed using a behavioral evaluation involving eight rats in a Morris water maze test. The experiment involved dividing the rats into two groups: a positive group induced with neurotoxins (scopolamine) and a control group provided with regular rat chow and water ad libitum. The positive group exhibited signs of depression and reduced mobility due to the induced neurotoxins. Subsequently, the induced rats were orally treated with extracts from *Rosmarinus officinalis* L. Hidden cameras were strategically placed in different sections of the animal housing facility to record the rats' swimming patterns and behavioral activities. The rats underwent learning and spatial memory retention phases.

The rats received varying doses of rosemary leaf extracts dissolved in distilled water, with doses of 50, 100, and 200 mg/kg administered through oral gavage

(1 mL). After treatment, the laboratory mice were induced with a single dose of scopolamine intraperitoneally. The rats were then observed for their ability to locate the platform within 60 s, considering the process of navigating to the correct environment and the reduction of dormancy in each mouse. The results of the experiment highlighted the potential neuroprotective effect of the rosemary leaf extracts on the proper functioning of the hippocampus, particularly emphasizing the effectiveness of rosmarinic acid, a key constituent of rosemary leaves.

Currently, there is a growing need for further research on the therapeutic potential of *Rosmarinus officinalis Linn.* in the treatment of cognitive impairment. Existing studies in this area are limited, and there is a growing interest among researchers to conduct more comprehensive research in the future to gain deeper insights into the various aspects of the rosemary plant [5]. The objective of this chapter is to explore evidence-based research that demonstrates the therapeutic properties of Rosmarinic acid and other phytochemical constituents found in rosemary leaves as potential candidates for mitigating memory loss in individuals.

2 Overview of Neurodegenerative Diseases

Neurodegenerative diseases are a group of conditions characterized by a gradual decline in the function and structure of the nervous system, particularly affecting neurons in the brain and spinal cord. These illnesses can significantly diminish a person's quality of life and often lead to the progressive loss of cognitive and physical abilities. Neurodegenerative diseases typically involve the accumulation of abnormal proteins, oxidative stress, and inflammation within the brain, although their precise causes are not always fully understood. Several well-known examples of neurodegenerative diseases are summarized in Table 1.

1. Alzheimer's disease: This is the most common neurodegenerative disorder, primarily impacting memory and cognitive functions. It is characterized by the buildup of tau protein tangles and beta-amyloid plaques in the brain.
2. Parkinson's disease: Parkinson's disease affects motor coordination and movement and is associated with the loss of dopamine-producing neurons in the brain. Symptoms often include tremors, stiffness, and slow movements.
3. Huntington's disease: This genetic disorder leads to the degeneration of neurons in the basal ganglia and cortex, resulting in cognitive decline, psychiatric symptoms, and motor impairment.
4. Amyotrophic lateral sclerosis (ALS), also known as Lou Gehrig's disease: ALS affects motor neurons in the brain and spinal cord, causing issues with breathing, speaking, swallowing, muscle weakness, and paralysis.
5. Multiple sclerosis (MS): In this autoimmune disease, the immune system targets the myelin sheath surrounding nerve fibers in the central nervous system, leading to various neurological symptoms like fatigue, coordination problems, and sensory disturbances.

Table 1 Common neurodegenerative diseases

Neurodegenerative disease	Description	Key features/symptoms
Alzheimer's disease	Affects memory and cognition, characterized by beta-amyloid plaques and tau protein tangles in the brain.	Memory loss, cognitive decline.
Parkinson's disease	Impairs movement, linked to dopamine neuron loss.	Tremors, rigidity, bradykinesia (slow movement).
Huntington's disease	Genetic disorder, causes basal ganglia and cortex neuron degeneration.	Motor dysfunction, psychiatric symptoms.
Amyotrophic Lateral Sclerosis	ALS or Lou Gehrig's disease, affects motor neurons in brain and spinal cord.	Muscle weakness, paralysis, speaking/ swallowing difficulties.
Multiple Sclerosis (MS)	Autoimmune disease attacks myelin sheath, central nervous system.	Fatigue, coordination problems, sensory disturbances.
Frontotemporal Dementia (FTD)	Degeneration of frontal and temporal brain lobes.	Behavior/personality changes, language deficits.
Amyloidosis	Group of rare diseases, amyloid protein deposits in organs, including the nervous system.	Organ dysfunction, neurological symptoms.
Creutzfeldt-Jakob Disease (CJD)	Rare, fatal prion disease affecting the brain.	Rapid cognitive decline, muscle stiffness/twitching.
Progressive Supranuclear Palsy	Rare disorder affecting movement and balance.	Eye movement issues, speech/swallowing problems.
Lewy Body Dementia (LBD)	Characterized by Lewy body protein deposits in the brain, similar to Parkinson's symptoms.	Cognitive decline, visual hallucin

6. Frontotemporal Dementia (FTD): FTD involves the degeneration of the frontal and temporal lobes of the brain, resulting in changes in behavior, personality, and language skills.
7. Amyloidosis: Amyloidosis encompasses a group of rare disorders where abnormal proteins called amyloids accumulate in various organs, including the nervous system, causing neurological symptoms and organ dysfunction.
8. Creutzfeldt-Jakob disease (CJD): CJD is a fatal prion disease that damages the brain, causing muscle twitching, stiffness, and rapid cognitive decline.
9. Progressive supranuclear palsy (PSP): PSP is a rare neurological condition that impairs balance and movement, often leading to difficulties in swallowing, speaking, and eye movements.
10. Lewy body dementia (LBD): LBD is a type of dementia characterized by the presence of abnormal protein deposits called Lewy bodies. It leads to cognitive impairment, visual hallucinations, and movement symptoms resembling Parkinson's disease.

While the causes, symptoms, and progression rates of these neurodegenerative diseases vary, they all share a common feature: the deterioration of the nervous system, resulting in significant disability, often necessitating specialized care and treatment.

The diagnosis of neurodegenerative diseases is characterized by the prevalence of ongoing memory loss, which is most commonly associated with dementia. This condition often manifests as a transition from the normal aging process, affecting many older individuals, but it is increasingly being observed in younger people as well. Dementia is influenced by various factors, including depression, anxiety, physical health, sleep patterns, lifestyle choices, aging, gender, and the cognitive capacity of individuals, particularly in terms of reasoning, as assessed by the function of the Hippocampus [39].

The amygdala, a brain region, plays a vital role in cognition, learning, memory, emotional regulation, and response to stress. However, many aging individuals experience issues related to thinking, changes in behavior, reasoning, and memory, resulting in reduced productivity in their daily lives.

Neurodegenerative diseases like Alzheimer's disease, Parkinson's disease, Huntington's disease, and motor neuron diseases are considered multifactorial age-related conditions that affect the intricate central nervous system of the brain, typically occurring with aging. Alzheimer's disease, in particular, is the most common form of dementia and is closely associated with a decline in cholinergic signaling to the brain. It currently affects approximately 50 million people worldwide, with expectations of this number tripling by 2050.

Several modifiable risk factors are linked to the development of Alzheimer's disease and dementia, including depression, obesity, diabetes, low levels of physical and mental activity, and hypertension. Additionally, factors such as sleep disturbances and anxiety have been reported to have connections to memory loss. Alzheimer's disease is characterized by irreversible neuron loss and impaired brain function, potentially due to neurotoxicity induced by beta-amyloid proteins and etau and beta-amyloid protein plaques buildup.

In summary, neurodegenerative diseases are associated with memory loss and cognitive decline, affecting individuals across various age groups. Alzheimer's disease is a prevalent form of dementia with modifiable risk factors, and its impact on global health is expected to increase significantly in the coming decades.

3 Overview of Alzheimer's Disease

Alzheimer's disease is a progressive and degenerative condition that primarily affects memory, thinking, and behavior. It falls under the umbrella of dementia, which describes significant cognitive decline interfering with daily life. While it's most commonly associated with older individuals, Alzheimer's, also known as early-onset Alzheimer's, can impact people in their 40 and 50 s. The key aspects of Alzheimer's disease are summarized in Table 2.

Table 2 Concise summary of key aspects of Alzheimer's disease

Aspect	Description
Definition	Progressive and degenerative brain disorder
Common symptoms	Memory loss, cognitive decline, behavior changes
Pathology	Accumulation of beta-amyloid plaques and tau tangles in the brain
Risk factors	Age, genetics, family history, cardiovascular health, head injuries, lifestyle
Stages	Early stage, middle stage, late stage
Diagnosis	Comprehensive evaluation, ruling out other causes
Treatment	No cure, medications to manage symptoms, non-drug interventions
Caregiving	Significant burden on caregivers, support needed
Research	Ongoing efforts to understand causes and develop treatments

1. **Symptoms:** Alzheimer's often begins with mild memory problems and difficulty performing cognitive tasks. Over time, these symptoms worsen, leading to confusion, disorientation, language difficulties, impaired judgment, and personality changes. In advanced stages, individuals may struggle to recognize loved ones or perform everyday tasks.
2. **Pathology:** A hallmark of Alzheimer's is the accumulation of abnormal protein deposits in the brain. These include tau tangles within cells and beta-amyloid plaques between nerve cells. These abnormalities disrupt communication among brain cells and lead to their death.
3. **Risk Factors:** While the exact cause of Alzheimer's remains uncertain, several risk factors have been identified. Age is a primary factor, with risk increasing significantly after the age of 65. Family history and genetics also play a role. Other risk factors include cardiovascular health, head injuries, and lifestyle factors like diet and exercise.
4. **Stages:** Alzheimer's typically progresses through three stages: early, middle, and late. Early-stage symptoms include mild memory issues, progressing to greater confusion and memory loss in the middle stage. In the late stage, significant cognitive decline, loss of communication skills, and round-the-clock care are often required.
5. **Diagnosis:** Diagnosis involves a comprehensive evaluation, including medical history, cognitive tests, neurological assessments, and sometimes brain imaging. While there's no definitive test for Alzheimer's, diagnosis is typically reached by ruling out other potential causes of cognitive impairment.
6. **Treatment:** Currently, there's no cure for Alzheimer's disease. However, some medications can help manage symptoms and slow disease progression, particularly in the early stages. Non-pharmacological interventions such as cognitive training and lifestyle changes can also enhance the quality of life.
7. **Caregiving:** Alzheimer's places a significant burden on caregivers, often family members. Providing physical and emotional care for someone with Alzheimer's

can be challenging. Support groups, respite care, and professional assistance can help reduce caregiver stress.

8. **Research:** Ongoing research aims to better understand the causes of Alzheimer's, develop effective treatments, and ultimately find a cure or preventive measures. Studies focus on genetics, inflammation, and lifestyle choices contributing to the disease.

4 Biology, Cultivation, Nutritional and Proximate Composition of Rosemary Leaves

Rosemary leaves, belonging to the Lamiaceae family, are characteristic of the Mediterranean region and are widely recognized for their diverse biological properties, making them valuable in both traditional medicine and culinary applications [36]. While rosemary cultivation is not as abundant in places like Nigeria compared to more developed tropical regions, efforts are underway to encourage farmers to cultivate this versatile herb in larger quantities.

Rosemary thrives in warm climates with moderate humidity levels and exhibits good heat tolerance. It prefers temperatures between 55° and 80° Fahrenheit and requires well-draining soil to flourish [10]. Therefore, successful cultivation should take place in locations with favorable climatic conditions.

Cultivating rosemary involves sexual reproduction and requires loamy-rich soil that is well-moistened and offers excellent drainage to enhance the plant's aromatic intensity [49]. Alternatively, rosemary can be propagated from non-woody sprigs. To achieve this, softwood cuttings are taken in spring, preferably after the plant has flowered, without including the flowers themselves. These cuttings, measuring around 3–5 in. and taken just below a branching point or leaf node, are placed in a compost mix with a significant portion of vermiculite. The container is then kept in a suitable environment, such as a propagator, cold frame, or windowsill, ensuring the soil remains consistently moist but not overly wet. After approximately 4 weeks, when the plant offers firm resistance upon a gentle tug, it is considered mature and ready for harvest [58].

Cultivating rosemary from seeds is typically done in the spring, although it requires patience due to the slow germination process and relatively low success rate. To start, the seeds should be placed in a well-drained compost pot indoors, ideally at least 3 months before the growing season begins. It's recommended to use a mix of loam compost with plenty of vermiculite or perlite. After moistening the seeds, the pot can be placed in a propagator. Seedlings typically emerge within 14–28 days and can then be removed from the propagator. Once they reach a height of around 3 in., they should be transferred to a larger pot to continue maturing. Harvesting can occur when the stems become strong [58].

Rosemary leaves are highly valued as a culinary herb, adding flavor to various dishes, particularly meats like lamb and fish, lemon sauces, stews, and beans. Additionally, they possess numerous medicinal properties, including antioxidant and antibacterial qualities. The key chemical constituents responsible for these properties are Rosmarinic acid, Carnosol, Carnosic acid, and essential oils rich in terpenes and terpenoids, including alpha-pinene, 1,8-Cineole, alpha-terpineol, camphor, borneol, and myrcene [16].

In terms of nutritional content, fresh rosemary leaves (*Rosmarinus officinalis Linn.*) contain essential minerals such as manganese, potassium, magnesium, copper, calcium, iron, along with vitamins A, C, B6, thiamine, riboflavin, and folate. Rosemary is cholesterol-free and provides around 131 calories per gram serving when consumed. In addition to these nutrients, it contains pyridoxine, folate, ursolic acid, carnosol, carnosic acid, rosmanol, 4-hydroxybenzoic acid, and riboflavin [59].

Furthermore, research by Ezza and Malia [25] suggests that rosemary extract may have memory-enhancing properties. This effect is likely attributed to its primary constituent, rosmarinic acid, a potent flavonoid known for its potential to reduce the risk of memory loss. Rosmarinic acid works in a complex manner within the brain by modulating the neurotransmission of acetylcholinesterase, an enzyme that plays a crucial role in the production of the neurotransmitter acetylcholine. An imbalance in acetylcholinesterase levels can lead to cognitive issues. Table 3 summarizes the biology, cultivation, nutritional, and some uses of rosemary leaves.

Table 3 Examples of some common neurodegenerative disorders and their symptoms

Aspect	Description
Biology	*Rosmarinus officinalis* – Rosemary is an aromatic, evergreen herb native to the Mediterranean region. It belongs to the Lamiaceae family.
Cultivation	Rosemary is grown as a perennial shrub. It prefers well-drained soil and full sun exposure. It can be cultivated in gardens, pots, or containers.
Nutritional composition	Rosemary leaves are low in calories. They contain dietary fiber, vitamins, and minerals. Notable vitamins include vitamin A, vitamin C, and vitamin B6. Important minerals include calcium, iron, and magnesium.
Bioactive compounds	Rosemary contains several bioactive compounds, including rosmarinic acid and antioxidants like flavonoids and phenolic acids.
Flavor and aroma	Rosemary has a strong, woody aroma and a slightly bitter, pine-like flavor. It is commonly used as a seasoning in various culinary dishes.
Medicinal and culinary uses	Rosemary is used in traditional medicine for its potential health benefits, including improved digestion and cognitive function. It is a popular herb in cooking, enhancing the flavor of dishes like roasted meats, soups, and stews.

5 Active Chemical Composition of Rosemary (Rosmarinic Acid)

In recent times, there has been a noticeable increase in the recognition of the value of using natural medicinal plant products to address various health concerns. This growing awareness has led to a heightened interest in understanding the chemical compounds present in these plants, particularly those with properties that can mimic the effects of certain diseases, such as Alzheimer's disease. This discussion focuses on the rosemary plant, which contains essential oils known as Rosmarinic acid and is recognized for its potential in mitigating the effects of Alzheimer's disease.

Rosmarinic acid is a group of phytochemicals found in rosemary leaves, and they encompass flavonoids and other phenolic compounds, including terpenes. These compounds can be extracted from rosemary using solvents like ethanol, acetone, and hexane [1]. The extraction process often involves the use of supercritical carbon dioxide, highlighting the bioactive nature of these substances [59, 62].

Research has shown that these isolated compounds play a role in inhibiting structural neurodegenerative changes [15]. Furthermore, the removal of beta and tau proteins has been associated with improved Alzheimer's disease management in elderly individuals [53]. Some specific compounds identified in rosemary include rosmaridiphenol, alpha-amyrin, botulin, luteolin, diterpenes, and beta-amyrin.

It's worth noting that the composition and concentration of these isolates can vary based on factors such as the plant's country of origin, drying and storage methods, weather conditions, cultivation practices, genetic variation, and harvest timing [23].

Examining each of these constituents in detail, it's noteworthy that phenolics and flavonoids have been reported to mimic the action of insulin in the treatment of diabetes mellitus [49]. The phytochemical active constituents, including rosmarinic acid, have unique mechanisms of action that contribute to their therapeutic functions as anti-memory agents. Understanding these individual properties is crucial for appreciating their potential health benefits.

6 Some Phytochemical Constituents of Rosemary Leaf (*Rosmarinus officinalis Linn.*) for the Alleviation of Alzheimer's Disease

Rosemary leaves contain a range of active bioactive chemical constituents, each with its own unique properties and potential health benefits, particularly in alleviating Alzheimer's disease. Some of these constituents, including rosmarinic acid, caffeic acid, p-coumaric acid, carnosol, ursolic acid, 4-Hydroxybenzoic acid, and carnosic acid, belong to various chemical classes, such as monoterpenes, diterpenes, and polyphenolic compounds. The chemical names, molecular formulas, molecular weights, and chemical classifications of these constituents are detailed in Table 4. Additionally, the chemical structures of these phytochemical constituents are illustrated in Table 5.

Table 4 Summary of some identified phytochemical constituents of *Rosmarinus Officinalis Linn*

Phytochemical constituents	Compound name	Molecular formula	Molecular weight (g/mol)	Chemical classification	References
Rosmanol	20-Deoxocarnosol	$C_{20}H_{26}O_5$	346.4	Phenolic diterpenes	[15, 74]
Carnosol	4aR-(epoxymethano)phenanthrene-2-one	$C_{20}H_{26}O_4$	330.4	Ortho-phenolic diterpene	[15]
Carnosic acid	Abieta-8,11,13-triene	$C_{20}H_{28}O_4$	332.4	Benzenediol abietane diterpene	[15]
Rosmarinic acid	3,4,Dihydroxyphenylactic acid	$C_{18}H_{16}O_8$	360.1	Flavonoids	[15, 79]
Caffeic acid	3-(3,4,Dihydroxyphenyl)-2-propenoic acid	$C_9H_8O_4$	180.2	Phenols	[9]
4-Hydroxybenzoic acid	Para-Hydroxybenzoic acid	$C_7H_6O_3$	260.2	Phenols	[34, 68, 83]
P-Coumaric acid	(2E)-3-(4-Hydroxyphenyl)prop-2-enoic acid	$C_9H_8O_3$	164.2	Phenols	[73]
Oleanic acid	4a(2H)-carboxylic acid	$C_{18}H_{34}O_2$	456.7	Pentacyclic triterpenoid	[26, 35, 78]
Ursolic acid	Urs-12-en-28-oic-acid	$C_{30}H_{48}O_3$	456	Pentacyclic triterpenoid	[91]
Beta-Amyrin	(3-beta)-oliean-12-en-3-ol	$C_{33}H_{58}O_5$	498.9	Pentacyclic triterpenoid	[12, 85]

Table 5 (continued)

Phytochemical constituents	Chemical structures	References
Ursolic acid		[20]
Beta-Amyrin		[17]

To obtain these valuable constituents, rosemary leaves sourced from local farms are harvested and carefully extracted. Various extraction methods can be employed, depending on the polarity of the specific compounds being targeted. These methods may include traditional hydro-distillation, maceration, decoction, and solvent extraction using solvents like ethanol, methanol, or n-hexane. Alternatively, more modern techniques, such as “Supercritical Fluid Extraction” (SFE), can be utilized. The choice of extraction method depends on the specific compounds of interest and the desired clinical application as a phytomedicine product [8, 36].

6.1 Caffeic Acid

Caffeic Acid (CA) has been identified as a metabolite derived from phenolic acid and has shown promise in reducing oxidative stress and brain damage by inhibiting 5-Lipoxygenase, according to reports by Cai et al. [14]. Additionally, Andrade et al. [9] conducted research indicating that CA has significant potential as it inhibits the fibrillation of amyloid alpha-beta peptides within neuronal membranes, as observed in an in-vitro analysis using an experimental rat model. It’s worth noting that while CA did disaggregate amyloid-beta peptides, its activity exhibited a step-wise directional increase over time due to the presence of lipid membranes in the rat brain. This characteristic makes caffeic acid a potential constituent in addressing memory loss, particularly in diseases like Alzheimer’s.

6.2 4-Hydroxybenzoic Acid

Also known as p-hydroxybenzoic acid, 4-Hydroxybenzoic acid is a monohydroxy benzoic crystalline salt that is moderately soluble in chloroform and highly soluble in alcohols and acetone, classified as a "polar organic solvent." It serves as a precursor to aspirin and is naturally found in substances like rosmarinic acid and coconuts [21]. This compound possesses several biological properties, including neuroprotective and antioxidative effects, which contribute to combating reactive oxygen species in the brain [32].

6.3 P-Coumaric Acid

P-coumaric acid, a natural compound with the chemical formula $C_9H_8O_3$, is a hydroxycinnamic acid [82] that forms an esterified system with tartaric acid known as tartaric p-coumaroyl ester [73]. This compound has immunoregulatory properties and is soluble in water and other solvents like diethyl ether and ethanol. P-coumaric acid can cross the blood-brain barrier and has a neuroprotective role, as evidenced by its ability to reduce neurotoxicity induced by alpha-beta amyloid proteins [33] in the hippocampal neuronal region of the brain, mitigating cognitive impairment [72]. It is also found in vegetables like rosemary leaves and is biosynthesized from cinnamic acid. Recent research by Yu et al. [88] demonstrated that p-coumaric acid has a neuroprotective effect against memory impairment induced by chronic corticosterone [28]. This effect was attributed to the reduction of oxidative stressors in the brain, along with interactions with neuronal receptors in the hippocampus [65]. Specifically, p-coumaric acid appeared to interfere with the interaction between corticosterone-induced advanced glycation end products and their receptors, restoring balance and protecting against depression and memory impairment [88].

6.4 Rosmarinic Acid

Rosmarinic Acid is a naturally occurring compound found in rosemary leaves. It has a chemical structure represented as $C_{18}H_{16}O_8$ and belongs to the Lamiaceae family. This compound has distinct characteristics, including a molecular weight of 360.1 g/mol, solubility in various solvents like water and formaldehyde, a melting point of 171–175 °C, and a boiling point of 694.7 °C [79].

Rosmarinic acid is known for its complex actions on inflammatory processes, including inhibiting cytokine release from activated T-cells and preventing T-cell activation. These properties make it relevant in addressing memory loss and allergic inflammatory reactions [63]. As the field of immunology and research techniques advances, the mechanisms of action of rosmarinic acid are becoming increasingly intricate.

In terms of memory loss, studies suggest that rosmarinic acid has anti-inflammatory and neuroprotective properties. It may protect against cognitive damage and aid in recovery [35]. The mechanism behind its action involves suppressing the accumulation of beta-amyloid plaques in the brain, which is associated with Alzheimer's disease. Rosmarinic acid accomplishes this by modulating the neurotransmission of acetylcholinesterase, an enzyme that affects the production of the neurotransmitter acetylcholine. By normalizing acetylcholinesterase and acetylcholine levels in the brain, rosmarinic acid contributes to improved cognitive function [25].

Furthermore, Rosmarinic Acid is considered the most active component of rosemary leaves and one of the most important polyphenols. It acts on receptors in the hippocampus, enhancing memory and combating memory loss caused by the accumulation of beta-amyloid proteins. It works by cleaving the amyloid precursor protein (APP) in the presence of the enzyme alpha-secretase, preventing the formation of amyloid plaques [77].

Rosmarinic acid is classified as an aqueous phenolic compound [34] and is known for its anti-inflammatory properties, primarily due to the presence of the RosA moiety. Given the rising concerns about memory impairment, incorporating rosemary leaves into our diet may enhance brain activity. Rosmarinic acid plays a vital role in addressing memory-related issues and neuroprotection ([83]; Guo et al. [31]) offering potential benefits in treating and preventing memory loss disorders.

6.5 Rosmanol

Rosmanol, with a chemical structure represented as $C_{20}H_{26}O_5$, is a compound found naturally in rosemary leaves. Traditionally, it was extracted using organic solvents like n-hexane, and the bioactive compounds were purified [55]. However, modern extraction methods such as Pasteurized Liquid Extraction (PLE) and Supercritical Fluid Extraction (SFE), using carbon dioxide (CO_2) and co-solvents like ethanol or methanol, have replaced these older methods. SFE offers improved selectivity, better fractionation capabilities, and higher extraction yields [74].

For enhanced absorption and potential anti-memory effects, combining Rosmanol and carnosol is recommended. Rosmanol is commonly found in the Lamiaceae family, such as in rosemary leaves, and is a polyphenol of 3,4-Dihydroxyphyllique, synthesized from carnosol in the human metabolic pathway [18]. Previous studies have identified Rosmanol as a potent anti-inflammatory compound that can inhibit the activation of nuclear factor pathways responsible for cell damage [54].

In terms of its mechanism of action in memory loss, research by Ayodeji et al. [11] on Wistar rats examined its inhibitory effects on iron-induced lipid peroxidation and key enzymes like Acetylcholinesterase (AChE) and Butyrylcholinesterase (BChE), which play crucial roles in brain neurotransmission. The study evaluated the antioxidant activity of Rosmanol as compared to galantamine, a typical cholinesterase inhibitor. The results showed that Rosmanol significantly increased scavenging activity in the brain cells of the rats. Molecular docking evaluations revealed a binding activity with AChE and BChE, indicating its potential affinity for inhibiting cholinergic enzymes and lipid peroxidation in brain neurons [2].

The scavenging activity of Rosmanol, acting as a cholinesterase inhibitor for improved memory function, is attributed to secondary metabolites known as flavonoids. These flavonoids are considered safe and have been shown to have neuroprotective effects. They prevent the action of acetylcholinesterase and enhance memory [13]. In the experiments, Rosmanol exhibited a binding energy of −11.1 kcal/mol, surpassing that of the galantamine inhibitor, which had a binding energy of −10.8 kcal/mol [80].

Rosmanol, with its neuroprotective and cholinesterase-inhibiting properties, holds promise in addressing memory loss and cognitive function, potentially offering therapeutic benefits for individuals experiencing memory-related disorders.

6.6 Carsonic Acid

Carsonic acid, an abietane diterpenoid extracted from rosemary leaves, has been associated with anti-memory effects [38]. It is obtained through an evaporation extraction method using hexane and subsequent dissolution in methanol, followed by complete evaporation. This compound is a carboxytricyclic compound categorized as a member of catechols and a monocarboxylic acid. It features a hydroxyl and carboxylic group at positions 11 and 12, and it is also substituted at position 20. As a member of the carboxytricyclic group, it falls under the category of catechols and is a conjugated acid of carnosate.

In terms of its mechanism of action in addressing memory loss problems, Carsonic Acid (CA) has demonstrated neuroprotective properties (Guo et al. [31]) in in-vivo experiments conducted by Takumi et al. [84] and Lipton et al. [57]. In these studies, mice were subjected to a downregulation of microglia and increased serum levels of proinflammatory cytokines, including tumor necrotic factor alpha. This proinflammatory cytokine activated the KEAP1/NRF2 pathway, leading to an increase in anti-inflammatory factors. The mice were then treated with 10 mg/kg body weight of CA extracts administered via the transnasal route for periods ranging from 14 days to 3 months.

The results showed significant behavioral and histological improvements in the treated mice, suggesting a translational progress. Histological examination of the brain indicated strong evidence that the formation of reactive oxygen species, responsible for oxidative stress and contributing to neuronal and synaptic damage, plays a role in the pathogenesis of memory impairment [57].

6.7 Oleanic Acid

Oleanic acid, also known as oleanolic acid ($C_{30}OH_{48}O_3$) [78], also possesses a chemical modification involving triple bonds, specifically the C-3 hydroxy, C-12, C-13, and the addition of a fourth one, C-28 carboxylic acids. This leads to the creation of a sequence of new synthetic oleanane triterpenoids [37, 81]. This compound is found naturally as 3, beta-hydroxyolean-12-en-28-oic acid and is biologically active in approximately 1620 plant species, including *Rosmarinus officinalis Linn.* [26, 30], making it widely distributed in the plant kingdom.

Oleanic acid is a phytochemical constituent of saponins, which act as anti-memory agents, particularly in Alzheimer's disease, by blocking the action of the enzyme nitric oxide synthase involved in brain inflammation. Its affordability and availability make it a suitable candidate for further synthetic modification and production through in-vitro techniques such as Heterological Biogenesis or Artificial Biology [70, 90].

6.8 Ursolic Acid

Ursolic acid has been reported to alleviate early subarachnoid hemorrhagic brain injury in experimental rat models [91]. When rats were fed with 25–50 mg per body weight per day (25/50 mg/kg/day) of ursolic acid extract, significant reductions in brain inflammation were observed after a 48-h observation period. This effect was attributed to anti-inflammatory constituents, including intercellular adhesion molecule-1, inducible nitric oxide synthase, and matrix metalloproteinase-9, along with a decrease in apoptosis scores, showcasing the neuroprotective properties of ursolic acid.

6.9 Beta-Amyrin

Beta-amyrin is a natural chemical compound widely distributed in plants, including rosemary leaves. It is classified as a pentacyclic triterpenoid and is considered a component of glycyrrhizin, used as a sweetener and having pharmacological activity. Beta-amyrin originates from the precursor oleanolic acid and is positioned at the 3 beta-position between positions 12 and 13 [12, 85].

Beta-amyrin exhibits neurological effects, including memory regulation [66]. Research has demonstrated its neuroprotective properties, particularly in an Alzheimer's mouse model with synaptic plasticity in the hippocampus. In clinical experiments, mice with Alzheimer's disorder were treated with beta-amyrin extract from rosemary leaves, showing positive effects. This treatment was compared with a positive control group that received minocycline, which has been reported to have both positive and negative outcomes in Alzheimer's rat models [6, 29, 61].

7 Conclusion

Alzheimer's disease, a form of memory loss known as Vascular Dementia, is becoming a growing concern, not only among the elderly but also in younger individuals. Various factors, including physical inactivity, aging, stress, and depression, contribute to this alarming trend. The conventional approach of using drugs that interact with multiple receptors, resulting in low bioavailability, has led to a shift toward exploring phytomedicine. Rising healthcare costs and a shortage of specialized healthcare professionals have prompted scientists to consider phytomedicine as an alternative therapeutic approach for individuals with conditions like Alzheimer's.

Phytomedicine, which involves investigating the therapeutic properties of traditional plants, offers a promising avenue for enhancing drug efficacy and therapy. Scientists are increasingly recognizing its potential, as nature often provides abundant solutions to the challenges faced in pharmacological interactions. Within the spectrum of phytomedicine, the constituents of *Rosmarinus officinalis Linn.*, including caffeic acid, rosmarinic acid, rosmanol, p-coumaric acid, beta-amyrin, among others, have been highlighted for their potential in alleviating memory loss associated with Alzheimer's and dementia.

Numerous research studies have reported the anti-memory effects of rosmarinic acid on Alzheimer's disease and dementia. These studies have elucidated the mechanisms by which these constituents can aid in the treatment of memory impairment, particularly in the hippocampus and other affected regions. In light of this extensive body of scientific evidence, it is imperative to emphasize the need for further exploration of the therapeutic potential of *Rosmarinus officinalis Linn.*, commonly known as rosemary leaf, within the context of Ayurveda medicine.

Furthermore, advancements in analytical methods, including molecular and genetic techniques, enable the precise isolation and quantification of rosmarinic acid and other constituents of *Rosmarinus officinalis Linn.* This knowledge is critical for developing dosage formulations for drug therapy. Given the favorable conditions for cultivating rosemary leaves, it is advisable to encourage widespread cultivation of this plant. Following harvest, regular consumption of rosemary leaves in accordance with recommended dosages by regulatory authorities such as the Food and Drug Administration (FDA) can significantly contribute to maintaining optimal brain function and cognitive abilities.

Moreover, there is a need for further clinical trials to establish detailed guidelines for incorporating rosemary leaf as a form of drug therapy, possibly in the form of nutraceuticals. Rosmarinic acid's inhibition of acetylcholinesterase in the brain positions it as an herb with anti-memory loss properties in adult therapeutic medicine. If these principles are well integrated into the clinical realm of drug therapy with FDA authorization, older individuals can effectively adopt these practices to ensure they receive the right nutritional benefits from this herb in their daily lives. This could potentially have a substantial impact on preserving good memory and cognitive function.

Abstract

Mosquitoes are insects with slender bodies, three pairs of jointed legs, a pair of wings, and an elongated mouthpart for sucking the blood of vertebrate animals including humans. The saliva of mosquitoes causes itchy rashes when deposited on the skin of humans during blood feeding. Many female mosquito species are capable of ingesting and/or transmitting infectious pathogens such as viruses that cause diseases like chikungunya fever, dengue fever, Japanese encephalitis, West Nile fever, yellow fever, Zika fever, and others to humans. These viral diseases are primarily transmitted through the bites of infected female mosquito (*Aedes*, *Anopheles*, and *Culex*) species in the Culicidae family. The listed viruses are endemic in the tropics and subtropics of Africa and Southeast Asia, where they cause the emergence and re-emergence of mosquito-borne viral diseases. These diseases are responsible for thousands of deaths reported annually within the affected regions. Treatment and management of mosquito-borne viral diseases with orthodox medicines are common in several parts of the world. But due to the toxicity of synthetic drugs, their alternatives (mainly from medicinal plants) are beginning to receive wider attention. Therefore, the age-long practice of using plants and herbs by herbalists in the tropics to treat different ailments with believable reports from patients and herbalists is being empirically evaluated presently. Based on verifiable reports of antiviral properties of some medicinal plants, this chapter intends to discuss medicinal plants diversity in the tropics, highlight recent updates on their use in the treatment and management of mosquito-borne viral diseases, and succinctly espouse some isolated and identified phytochemicals that are potentially active against the listed mosquito-borne viral diseases.

1 Introduction

Mosquito-borne viral diseases are spread through bites of female mosquitoes that are infected with viruses. Mosquito-borne viral diseases in the tropics include chikungunya, dengue, Japanese encephalitis, West Nile fever, yellow fever, Zika, and others. Mosquitoes that carry these viruses (vectors) belong to a few genera – *Aedes*, *Anopheles*, and *Culex.* These mosquito genera are well distributed in all the countries of Africa, Asia, South America, and parts of Europe. Over seven hundred million people globally suffer from mosquito-borne diseases with more than one million deaths annually [1–3]. Among the diseases, chikungunya is caused by an alphavirus that is primarily transmitted through the bites of infected female *Aedes* mosquitoes (*Aedes aegypti*, *Aedes albopictus*, and *Aedes furcifer*) [4]. The virus is presently endemic in the tropics and subtropics of Africa and Southeast Asia. The transmission cycles in these regions are between non-human primates and *Aedes* mosquito species. For dengue, the disease is rather caused by flavivirus which is transmitted through the bites of infected female *Aedes* mosquitoes (*Aedes aegypti* and *Aedes albopictus*). Dengue virus is a positive-stranded ribonucleic acid in the family Flaviviridae that causes one of the major morbidity and mortality in the tropics and subtropics. The disease is causing approximately ten thousand deaths with about 100 million symptomatic infections every year in more than 125 countries of the world and is being transmitted by *Aedes* mosquitoes [5, 6]. Japanese encephalitis is also another flavivirus disease that is spread and transmitted by *Culex* mosquito species. The virus is the leading cause of encephalitis in many tropical Asian countries with about 68,000 cases of symptomatic infections annually. The disease is endemic in about 24 WHO countries in Southeast Asia and Western Pacific regions with about three billion people at risk of being infected [7].

For West Nile, the disease is caused by a positive-stranded ribonucleic acid flavivirus in the family Flaviviridae. The virus is transmitted through the bites of infected *Culex* mosquito species (*Culex quinquefasciatus*, *Culex stigmatosoma*, *Culex thriambus*, *Culex pipiens*, and *Culex nigripalpus*). These *Culex* species are responsible for infecting birds such as blue jays and crows with West Nile virus and can occasionally infect other mammals such as dogs, horses, and humans. Unfortunately, West Nile virus can as well be transmitted by other species of birds [8–11]. Yellow fever is also another disease caused by flavivirus. The virus is transmitted through the bites of infected female *Aedes* mosquitoes (*Aedes aegypti* and *Aedes albopictus*). The virus is endemic in both North and South America and in the tropics of Africa. For clearer distinction, yellow fever is capable of causing epizootic infections in non-human primates and yellow fever outbreaks in humans [12]. Thus, a section referred to as the sylvatic reservoir system is in the primates; hence, yellow fever transmission encompasses urban (human and urban *Aedes* mosquitoes) and sylvatic (non-human primates and forest-restricted *Aedes* mosquitoes) cycles. The sylvatic cycle is responsible for the major cases reported in South America while the transmission of the virus from monkeys to humans or from human to human through bites of infected mosquitoes is currently reported in Africa alone [13–17]. In the case of Zika, the disease is also caused by a flavivirus that is transmitted through the bites of infected female *Aedes* mosquito species (*Aedes aegypti*, *Aedes africanus*, *Aedes albopictus*, and *Aedes hensilli*). *Aedes albopictus* has been noted to be the likely major vector due to its link to the Zika virus outbreak in Gabon in 2007. Unfortunately, the virus has been reported to be transmitted from mother to foetus, through blood transmission, organ transplantation, laboratory exposure, and sexual transmission [18–20]. Outside the 2007 outbreak of Zika virus in Gabon, other outbreaks have occurred in Micronesia and Brazil [21]. Furthermore, over 6000 cases of symptomatic Zika virus infections have been reported between 2015 and 2017 in the USA [22].

These mosquito-borne viral diseases have caused a reasonable economic loss for both families and government and thus aggravate poverty in developing countries. For instance, a dengue episode causes an ambulatory patient to lose 14.8 working days and $514 while non-fatal hospitalized patients lose 18.9 working days and $1491 in eight burdened countries [23], hence making mosquitoes the most arthropod of medical and veterinary importance. Mosquitoes are insects in the family of Culicidae that are grouped with the common flies. They have slender bodies, three pairs of jointed legs, a pair of wings, and an elongated mouthpart for sucking the blood of vertebrate animals including humans. The saliva of a mosquito when transferred to humans during blood sucking can cause itchy rashes. Many female mosquito species are capable of ingesting and/or transmitting infectious diseases between humans or from animals to humans. Thus, different female mosquito species are transmitters of alphavirus and flavivirus pathogens, (Fig. 1) that cause mosquito-borne viral diseases such as chikungunya fever, dengue fever, Japanese encephalitis, West Nile fever, yellow fever, and Zika fever to humans [24].

Treatment and management of mosquito-borne viral diseases with orthodox medicines are very common. But due to the toxicity of orthodox-based medicine, their alternatives have gained attention. Based on the traditional use of plants and herbs by herbalists in the tropics to treat different ailments with believable reports from patients and herbalists, attention is being shifted to using medicinal plants, as a novel approach to treating viral diseases. Medicinal plants are highly diversified in the tropics and hence, have been used to treat and manage symptomatic viral infections by traditional healers. Medicinal plants in the tropics with complex bioactive phytochemicals that are rich for pharmaceutical purposes have been carefully selected and used in their crude forms by past generations, and the practice was handed over to the present generation based on folklores. There are many plant extracts and isolated compounds that have been reported to be antiviral agents and are less harmful, and less expensive as compared to orthodox medicines [25–28]. Based on verifiable reports of the antiviral properties of medicinal plants against viral diseases in the literature, this chapter shall discuss and tabulate medicinal plant

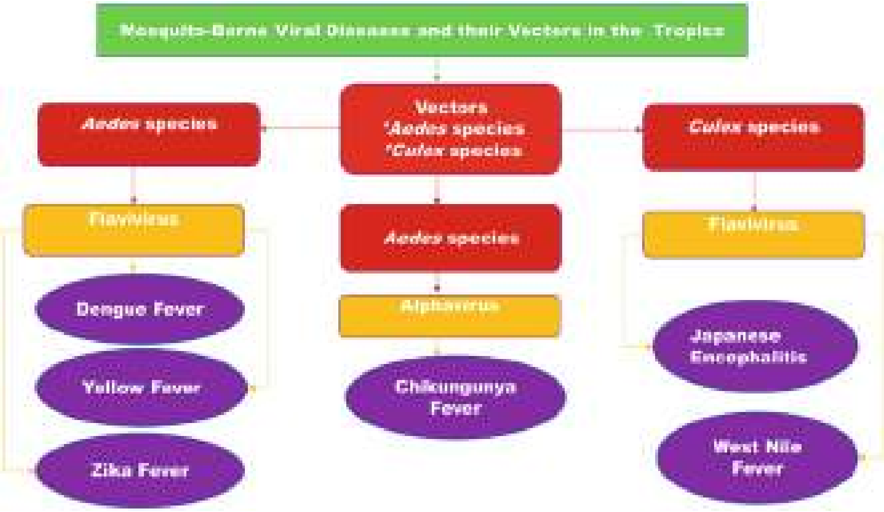

Fig. 1 Overview of viral diseases transmitted by mosquitoes in the tropics

diversity that is used in the treatment of mosquito-borne viral diseases in the tropics. This chapter will also highlight recent updates on the use of medicinal plants in the treatment and management of mosquito-borne viral diseases and as well espouse the isolated and identified phytochemicals that are potentially active against mosquito-borne viral diseases.

2 Overview of Distribution of Mosquito-Borne Viral Diseases in the Tropics

Environmental changes as a significant factor have induced viral diseases such as dengue fever which is an emerging serious public health importance and ranked the most concerned mosquito-borne viral disease with the potential of causing an epidemic. Dengue cases have recorded a multifold increase within the last 50 years with a staggering record of impacts on human and economic costs. One of the major fears about dengue is the fast spread of its vector: *Aedes aegypti* mosquito which has spread to more than 20 countries of Europe and to the Caribbean Islands where it was depicted to also vector chikungunya [24]. Mosquitoes are continually causing the emergence and re-emergence of mosquito-borne viral diseases that are threatening the world's public health systems and status. For instance, dengue fever estimated at 2.5 billion globally [29] affected about 75,454 people, and chikungunya fever affected 18,639 in India [30]. Other mosquito-borne viral diseases such as West Nile, Yellow fever, Zika, and others have also impacted human health and their socioeconomic importance is severely felt.

2.1 Chikungunya Fever

Chikungunya is a viral disease and its vectors are *Aedes aegypti* and *Aedes albopictus* mosquitoes. The virus which these *Aedes* mosquito species carry belongs to the Alphavirus genus in the family Togaviridae [31]. Chikungunya fever is thus a mosquito-borne disease that is now a worldwide public health threat. In the tropics, there are reports of outbreaks due to a high prevalence of *Aedes* mosquito species that transmit the virus to humans, circulation of the virus, and high population density in the urban cities of tropical countries [32]. *Aedes aegypti* is the most prevalent species in urban centres and is the major vector of the virus but as of 2006, *Aedes albopictus* was depicted to contribute to the spread of the virus to Europe and the Americas [33–36]. *Aedes aegypti* and *Aedes albopictus* are the major vectors of chikungunya in Asia and Indian Ocean region but other species of *Aedes*, *Culex annulirostris*, *Mansonia uniformis*, and *Anopheles* species are denoted to vector chikungunya virus [24].

There are three poly groups of the chikungunya virus (West African poly group; Eastern, Central, and Southern Africa poly groups; and the Asian poly group) that are distinctly separated geographically [37]. The virus causes chikungunya fever in man and was first diagnosed in Tanzania in the early 1950s. Since then, there have been subsequent outbreaks of the disease in sub-Saharan African countries and Asia [38]. Chikungunya epidemics have occurred in South-East Asia, India, Islands of the Pacific, and the Indian Ocean respectively in the last two decades leading to more than six million infections [4]. The virus has also been recorded in the Western Hemisphere with over two million cases of infection in about 50 American countries and 114 countries globally [39]. Chikungunya outbreaks were restricted in Africa (Democratic Republic of the Congo, Uganda, Central Africa Republic, Guinea, Angola, South Africa, Malawi, Nigeria, and other sub-Saharan countries) and Asia (Thailand, Cambodia, India, Myanmar, Philippines, Laos, Vietnam, Indonesia, Malaysia, and Sri Lanka) between the 1960s and 1980s [40]. There was an outbreak in a French territory in the Indian Ocean between 2005 and 2006, and about 266,000 inhabitants were affected. In 2007, the outbreak got to countries within the WHO South-East Asia Region and India with about 1.4 million cases. The disease was reported for the first time in Europe in 2007 in Northeast Italy. Similarly, the disease transmission was reported for the first time in 2013 at the WHO Region of the Americas, the Caribbean Island of Saint Martin, and other islands of the region [40].

There was a report of an average loss of more than 106,000 disability-adjusted life yearly, between 2010 and 2019, and in the year 2020, about 170,000 cases of chikungunya virus fever were reported globally, causing a higher rate of infant morbidity [41–43]. From 2004, chikungunya virus epidemics occurred in Kenya with 70% of her population being infected. Since then, it has spread to other countries like the Reunion Island, Thailand, Malaysia, India, Hong Kong, Taiwan, Sri Lanka, and other European and American countries [44–48]. Symptoms associated with acute infection include arthralgia/polyarthralgia, high fever, headache, myalgia, skin rashes, joint swelling, and nausea [49]. Chikungunya virus though causes low mortality with 0.07% death but patients with polyarthralgia can nurse it for months or even years after the acute phase of infection has been resolved and with joint pains that can last for months [41, 50].

2.2 Dengue Fever

Dengue fever is one of the viral infections imposing enormous economic burdens on the people of the tropics and subtropical countries. It is also referred to as backbone fever because it causes severe body pain mainly in the joints. The disease is caused by four flavivirus serotypes (dengue virus 1, dengue virus 2, dengue virus 3, and dengue virus 4) that belong to Flaviviridae family with dengue virus 2 being the most deadly virus. The virus is being harboured by female *Aedes aegypti*, *Aedes albopictus*, and *Aedes polynesiensis* mosquitoes which are known to thrive more in urban and semi-urban areas [51, 52]. Though the infection is asymptomatic and mild, the number of carriers is increasing considerably at the global level. Moreover, the actual number of infected cases is not comprehensively reported, or wrongly diagnosed with other febrile infections. The infected female mosquito bites in the day time and infect humans with the virus. More than 300 million people are reported to be infected every year, and about 22,000 of them are likely not to survive the infection [53].

Global infection of dengue fever is estimated at 2.5 billion with yearly recurrent or new cases at 50 to 100 million [51, 54, 55]. More than 40% of the world's population (amounting to about 2.5 billion people) are currently at risk of dengue infection. Going by WHO estimate, over 100 million people globally are infected annually, and about 500,000 of them especially children must be treated in the hospital while 2.5% of the infected persons cannot survive the disease. Dengue was earlier localized in just 9 countries of the world before 1970 but has now risen to endemic status in more than 100 countries (Africa, the Americas, South-East Asia, Western Pacific, and the Eastern Mediterranean). A report in 2010 showed that about 2.3 million in the Americas, Western Pacific regions, and South-East Asia are the ones mostly affected [24]. The disease is endemic in over 100 countries of Africa, Asia, America, Eastern Mediterranean, and Western Pacific regions. About 20 countries in Africa recorded dengue epidemics between 1960 and 2017 [56].

Due to the international trade of used tyres, timber, bamboo, and other similar stuff that provide breeding space for *Aedes*, another secondary dengue vector (*Aedes albopictus*) seen in Asia has spread to North America and Europe. *Aedes albopictus* is noted to have a wider geographical distribution because of its resilience and ability to survive in urban and rural environments. The eggs are resistant to harsh weather and therefore, can be viable all through the length of the dry season [24]. Female *Aedes aegypti* is the main vector of the dengue virus which is transmitted to humans when the female *Aedes* mosquito sucks blood from human beings. Once a female *Aedes* is infected, it can transmit the virus throughout its life cycle. Interestingly, *A. aegypti* are urban-restricted mosquitoes that breed in most man-made containers such as used tyres, beverage cans, plastic bottles, and the like. *Aedes* usually bite in the early hours of the morning and evening before dusk. The female can bite many people during its feeding phase. Infected individuals show signs of headache, fever, severe muscle and joint pains, and hemorrhagic fever which may lead to dengue shock syndrome which is a resultant effect of severe cases of dengue fever [57, 58].

Dengue fever is a severe flu-like illness that manifests with high fever, severe headache, muscle and joint pains, nausea, vomiting, swollen glands, or rash. Dengue is rarely fatal but severe ones come with possible serious complications, with symptoms that include low temperature, severe abdominal pains, and rapid breathing. Dengue virus has four serotypes (DENV-1, DENV-2, DENV-3, and DENV-4). Recovery from any of the serotypes confers a lasting immunity to the serotype. However, if infected by another serotype, it will still cause a severe dengue fever if not managed on time. Dengue infection presents symptoms that are related to malaria and other febrile conditions; hence, it is difficult to diagnose or predict if a patient is at risk or not at the time of medical examination [59]. Hemorrhagic fever was first reported in the 1950s during the dengue epidemics in Thailand and the Philippines. Presently, it is one of the primary roots of illnesses and mortality in many countries in Asia, India, and Latin America [60]. Untreated dengue cases may lead to complications such as respiratory distress, fluid accumulation, severe bleeding, organ damage, and others [61].

2.3 Japanese Encephalitis

Japanese encephalitis is a zoonotic disease (infectious disease transmitted from animals to humans) that contributes to one of the cases of morbidity and mortality in Southeast Asia and the Western Pacific area [62]. Japanese encephalitis is caused by a virus in the flavivirus (Flaviviridae) family. The virus is carried and transmitted to man by a *Culex* mosquito species and could cause permanent neuropsychiatric disorder in over 40% of cases and 20% death [63]. In some cases, the virus is transmitted by a tick. The disease affects mainly children and elderly people with compromised immunity [64].

Japanese encephalitis prevalence is highest in the tropics (China, Southeast Asia, Philippines, India, Japan, and Korea) where some major outbreaks have been reported [65]. Cases of Japanese encephalitis (mostly children below 5 years) are estimated at 50,000 leading to 10,000 deaths in a year. The disease exists in Asia at the islands of the Western Pacific in the East and extends to the Pakistanis border in the West and from the Republic of Korea in the North to Papua New Guinea in the South. Countries like Japan, the Korea Republic, Taiwan, and China are currently having considerably reduced cases but the disease has extended to India, Napa, and Sri Lanka where the disease is an important public health problem. Japanese encephalitis is mainly transmitted in rural agricultural provinces, especially among those living in flooded rice farms. It can as well occur near urban centres, and in temperate zones of Asia, as the virus transmission is seasonal [24].

Culex tritaeniorhynchus is the primary vector and transmits the virus; however, animals such as pigs and wading birds are potential transmitters of the virus. Humans are minor hosts as they may not be able to develop considerable concentrations of the virus in their bloodstreams that could infect female mosquitoes that are feeding. Japanese encephalitis virus when transmitted by an infected female *Culex* species to humans will usually show mild or no symptoms. Only a small fraction of humans infected develop inflammation of the brain that is associated with high fever, sudden onset of headache, disorientation, coma, tremors, and convulsions. About 25% of severe cases can be fatal while 30% of survivors would have lasting central nervous system damage [24].

2.4 West Nile Virus Disease

West Nile virus is a flavivirus-causing disease in the family Flaviviridae; the virus is transmitted by a *Culex* mosquito. West Nile virus disease presents fever, muscle weakness, encephalitis, and meningitis as symptoms without a known or medically acceptable treatment and no available vaccine yet. West Nile virus extends its distribution to Africa, Asia, Australia, and Europe and has spread to the USA, Mexico, Canada, and the Caribbean after being detected in New York City in 1999 [66]. It is maintained naturally in a *Culex* mosquito-bird-mosquito transmission cycle while man, horses, and other mammals serve as incidental hosts [67]. The majority of the individuals infected with the virus present no symptoms while about 20% of infected people experience some level of clinical symptoms such as West Nile fever but only a few will have severe West Nile neuro-invasive diseases, potentially fatal cases such as encephalitis, meningitis, acute fluid paralysis, fatigue, muscle weakness, and persistent tremors [68–70].

2.5 Yellow Fever

This disease is a known viral haemorrhagic fever that was before now regarded as a lethal disease until its vaccine was effectively developed. The disease is known to have an acute phase with symptoms such as fever, muscle pain, headache, shivers, loss of appetite, nausea, and vomiting. Most patients usually get relieved after 3–4 days but 15% of them enter a toxic phase making the patient to have jaundice and may be bleeding which could appear in the vomit. Factors such as less vaccinated population, urbanization, deforestation, climate change, and population movements have led to an increase in yellow fever cases; hence, about 200,000 infections and 30,000 cases of death are recorded yearly [24].

Yellow fever virus is transmitted by species of *Haemagogus* and *Aedes* mosquitoes to monkeys and humans. In African countries, yellow fever outbreaks have occurred in recent years as seasonal workers, nomadic, and displaced people were affected. North and Central America, the Caribbean, and Asia have had their share of the disease in the last 30 years due to an increase in air travel and sporadic increases in the distribution of *Aedes aegypti* in urban areas [24].

2.6 Zika Virus Disease

Zika virus is another flavivirus disease transmitted by *Aedes* species, which was identified in 1952 and circulated in Brazil in 2015 but was discovered in 1947 in Uganda with a transmission cycle between primates and wild *Aedes aegypti* which later infected humans [71]. The viral infection is now a serious threat to public health because of its suspected effect on the development of foetuses in pregnant women and malformations of congenital organs. It can as well cause meningitis and Guillain-Barre syndrome in severe cases [72–75].

Symptoms associated with Zika virus disease are similar to other febrile illnesses earlier stated, thus making its early diagnosis difficult. Zika virus infection is as well reported to be transmitted sexually; hence its global emerging epidemic threat has been warned by World Health Organization [76–78]. Proposed plans to fight the virus are to develop vaccines and screen molecules to inhibit different phases of the viral life-cycle [79–81].

3 Diversity of Medicinal Plants Reported to Be Used in the Treatment and Management of Mosquito-Borne Diseases in the Tropics

Based on the biology and life history of mosquitoes, it won't be out of place to say that mosquitoes are the most deadly insects globally. The assertion is because of many debilitating diseases transmitted to over one billion people every year [24]. Mosquitoes are vectors of many diseases such as malaria, dengue, yellow fever, lymphatic filariasis, chikungunya, Japanese encephalitis, West Nile fever, and Zika which collectively kill over one million people globally every year. Larvicidal and ovicidal activity of leaf and seed extract of plants against mosquitoes (*Aedes aegypti* and *Anopheles stephensi*) have been reported in some countries (India and Nigeria) [80–85].

Based on the World Health Organization's estimate, about 80% of the global population resort to medicinal plants as the basic source of their medical/healthcares [86]. Plants are known to produce phytochemicals such as alkaloids, flavonoids, essential oils, terpenoids, and polyphenols with different chemical structures. These chemicals are what plants use to defend themselves against microbial infection, herbivorous and insects attack, and environmental stress [87]. Phytochemicals have several organic activities that are antiviral, such as influenza, herpes simplex, hepatitis, and dengue, hence benefiting man, in fighting the above diseases [88–94].

Africa and countries in the tropics have a diverse range of medicinal/herbal plants that are used by traditional medicine herbalists for different ailments. However, there is a paucity of documented data on medicinal plants of the tropics in literature. In this section of the chapter, different reports of traditional medicines against mosquito-borne diseases in Africa and other countries in the tropics will be discussed. A concise review of scientific evaluation and validation of medicinal plants that have therapeutic and prophylactic properties against viral-causing diseases such as chikungunya, dengue, Japanese encephalitis, West Nile fever, yellow fever, and Zika fever. By extension, the records have shown that many plants in the tropics are medicinal and therefore, could be extended to the treatment and management of mosquito-borne viral diseases. This section, therefore, will highlight reports of different medicinal plants used in the treatment and management of mosquito-borne viral diseases that are documented in scientific literature.

3.1 Medicinal Plants for Treating and Managing Chikungunya Virus Fever

There are plant extracts that are reported to have anti-chikungunya virus properties (Table 1) with an interesting report that epigallocatechin gallate, derived from *Camellia sinensis* and *Curcuma longa* plants, can prevent the chikungunya virus from attaching to the host's cells and harringtonine from *Cephalotaxus harringtonia* blocking replication of the chikungunya virus in vitro study [95–97]. A study noted that extraction of phytochemicals for the treatment of diseases is dependent on the polarity of solvents; hence, hexane and chloroform are less polar solvents and therefore, could only extract alkaloids, coumarins, fatty acids, and terpenoids while more polar solvents such as ethyl acetate, ethanol, methanol, and water will extract saponins, tannins, flavones, polyphenols, terpenoids, anthocyanins, polypeptides, and lectins from plants [98].

Plants that have been reported to inhibit chikungunya virus at different levels of concentration include *Picrorhiza kurroa*, *Ocimum tenuiflorum*, *Terminalia chebula*, *Commiphora wightii*, *Cedrus deodara*, and *Zingiber officinale.* Among these plant

Table 1 Isolated phytochemicals reported to be used in the treatment and management of chikungunya

Isolated compound	Plant species	Plant's part	Medicinal activity	Reference
Coumarin (A and B)	*Mammea americana*	Seeds	*Active in Vero cells*	[37]
Curcumin	*Curcuma longa*	Bulb	Anti-chikungunya virus	[96, 99]
Berberine	*Berberis vulgaris*	Roots, stem-bark	Anti-chikungunya virus	[100–102]
Andrographolide	*Andrographis paniculata*	NS	Anti-chikungunya virus	[99]
Silymarin	*Silybum marianum*	Fruits, seeds	Anti-chikungunya virus	[103]
Baicalein	*Scutellaria baicalensis*	Roots	Anti-chikungunya virus	[104]
Silvestrol	*Aglaia foveolata*	NS	Anti-chikungunya virus	

Note: Phenols, saponins, alkaloids, flavonoids, and tannins are bioactive compounds contained in *Oroxylum indicum* plant which are anti-chikungunya virus [105, 106]; *NS* not stated

Table 2 Medicinal plants reported in India for the treatment and management of chikungunya fever

Plant family	Plant species
Acanthaceae	*Andrographis paniculata*
Asteraceae	*Pluchea lanceolata*
Brassicaceae	*Lepidium sativum*
Burseraceae	*Commiphora wightii*
Burseraceae	*Boswellia serrata*
Combretaceae	*Terminalia chebula*
Combretaceae	*Terminalia bellerica*
Cyperaceae	*Cyperus rotundus*
Euphorbiaceae	*Emblica officinalis*
Fabaceae	*Glycyrrhiza glabra*
Lamiaceae	*Ocimum sanctum*
Menispermaceae	*Tinospora cordifolia*
Ranunculaceae	*Nigella sativa*
Rubiaceae	*Rubia cordifolia*
Scrophulariaceae	*Picrorhiza kurroa*
Solanaceae	*Withania somnifera*
Verbenaceae	*Vitex negundo*
Zingiberaceae	*Zingiber officinale*
Zingiberaceae	*Curcuma longa*

Source: [107]

species, *Ocimum tenuiflorum* and *Terminalia chebula* inhibited 100% chikungunya virus at a concentration of 200 μg/ml [32]. Plants such as *Gynura bicolor*, *Hydrocotyle sibthorpioides*, *Ocimum americanum*, and others listed in Table 2 have anti-chikungunya virus; hence, their phytochemicals could be isolated and characterized as lead compounds in developing anti-chikungunya medicine. Based on extractants, water-extracted phytochemicals are weak against the chikungunya virus compared to other extractants [31]. Resistance and cost are some of the factors necessitating alternative means of anti-chikungunya virus. Thus, plant sources become a target due to their availability, cheapness, and diverse phytochemicals.

3.2 Medicinal Plants for Treating and Managing Dengue Virus Fever

Due to resistance, cost, and other medical logistics, the need to search for novel anti-dengue medications that are organically produced is voting for the use of medicinal plants which have been used widely by traditional medicine herbalists to treat febrile ailments. This option is anchored on safety, non-toxicity, and less harmful reports of the use of medicinal plants in the tropics. About 80% of Africans and Asians depend on traditional medicine as the basic healthcare for febrile diseases due to cost and geographical constraints [108]. At the moment, there is no specific treatment for dengue infection that is globally accepted among the medical professions. However, strategies to eliminate the disease are currently going on such as immunization, modulation of the host's immunity, and interfering with the host's ribonucleic acid [109]. Until these scientific innovations and breakthrough are presented, the traditional herbalists in the tropics have started using herbal formulations of plant-based materials to treat dengue infection which has been applauded by modern scientific reports. An example is the use of *Carica papaya*, a plant that has been used widely by traditional medicine herbalists to treat many febrile illnesses including dengue fever [59]. Hence, medicinal plants have been employed by traditional medicine herbalists, especially as one of the therapeutic approaches to treating and managing the disease. The practice of using medicinal plants in India to treat dengue viral infection is copious and has shown to be efficacious and better than using a single isolated compound. For instance, azadirachtin from *Azadirachta indica* was inefficient against dengue infection but the whole extracts strongly inhibited the dengue infection [60] which may be attributed to the synergistic effect of the compounds in the plant.

Medicinal plants have been used in developing countries to treat all known diseases and are as well becoming popular in developed countries [110]. Hence, 80% of the global population attends to their healthcare requirements by using medicinal plants [111]. Medicinal plants (Table 3) such as *Euphorbia hirta* and *Carica papaya* among other 31 species of plants are among the folkloric reports of medicinal plants against dengue infection in many African communities [112, 113]. The diversity of medicinal plants used in treating human-associated febrile infections such as dengue is estimated at 52,000 species [114]. These plants are reported to reverse and prevent dengue infection from reaching a critical stage by possessing different potentials to inactivate, inhibit, and increase blood platelet count, white blood cells, and neutrophils. Some can act as anti-dengue, prevent bleeding, and downregulate dengue infection [115].

Medicinal plants have diverse chemicals that are biologically capable to inhibit the virus replication cycle. As noted earlier, no medically approved drug is in the public domain for targeting the dengue virus. Other drugs that are approved to be positive for other viruses have been reported not to be effective as dengue virus is resistant to them, thus necessitating the use of medicinal plants to combat dengue disease. A study has presented isolated phytochemicals and their molecular structures that are depicted as anti-dengue (Table 4). The way these structured compounds work includes inhibition of the dengue virus at the post-infection stage, virus budding and secretion, binding of the peptide to the virus, and inhibition of the virus at an early stage of infection. Some will inhibit the dengue virus or have immunomodulatory activity, inhibit protease activity and secretion of virus particles, and inhibit entry. Some will block the activity of non-structural proteins (NS1, NS2, and NS3) especially NS3 protease, inhibit virus adsorption and host cell internalization, early stage of the virus cycle, and from binding to receptors. They can as well

decrease viral RNA production, act as virucidal such as catechin, and inhibition of viral particle assemblage [110].

3.3 Medicinal Plants for Treating and Managing Japanese Encephalitis

In a quest to also treat patients infected with the Japanese encephalitis virus with herbal formulations, a study [157] evaluated the antiviral activity of *Isatis indigotica* plant. The author reported low cytotoxicity of the plant but potentially inhibited Japanese encephalitis virus replication in vitro study. The plant's extract reduced the virus yield, block the virus attachment to the host, and showed virucidal activity. *Isatis indigotica* extracts were reported to contain active compounds such as indigotin, indirubin, indican, and isatin. Among these isolated phytochemical compounds of *I. indigotica*, indirubin was appraised to have strong protective potential against the Japanese encephalitis virus and proved less toxic to the host's cells.

Because of the need to develop safe and cheaper antiviral medicines, Roy et al. [158] also evaluated *Trachyspermum ammi* plant against the Japanese encephalitis virus. The authors reported that the essential oil obtained from the plant through distillation was able to inhibit the virus in vitro study, thus showing the anti-Japanese encephalitis virus activity. The essential oil of *Trachyspermum ammi* is reported to contain thymol, α-pipene, p-cymen, and limonene, which are its major curative agents against many diseases caused by fungi, bacteria, and viruses. The essential oil inhibited the Japanese encephalitis virus with low cytotoxicity and without the formation of plagues [159].

Table 4 Isolated phytochemicals reported to be used in the treatment and management of dengue

Isolated compound	Plant species	Plant's part	Medicinal activity	Reference
Castanospermine	*Castanospermum australe*	NS	Against dengue activity	[118]
Quercetin, quercetinin, chlorogenic acid, hyperoside	**Houttuynia cordata*	Leaves	Against dengue activity	[119, 120]
Rutin	*Spondias mombin*		Inhibition, anti-replication of DEV-2	[121]
Quercetin, ellagic acid	*Spondias tuberosa*	NS	Inhibition, anti-replication of DEV-2	
Fucoidan	*Cladosiphon okamuranus*	NS	Inhibition of dengue virus 2	[122]
Galactans	*Cryptonemia crenulata*, *Gymnogongrus torulosus*	NS	Inhibition of DEV-1,3, anti-replication in Vero cell	[123]
Kappa-carrageenan	*Gymnogongrus griffithsiae*, *Meristiella gelidium*	NS	Inhibition of dengue virus 2 and 3	
Trigocherrins A, trigocherriolides B and C	*Trigonostemon cherrieri*	Bark, wood	Dengue RdRp	[124]
Tatanan A	*Acorus calamus*	Roots	Anti-dengue virus	[125]
Andrographolide	*Andrographis paniculata*	Leaves	Inhibition of dengue virus 2	[126–128]
Nimbin, desacetyl nimbin, salanin	*Azadirachta indica*	Leaves	Inhibition of dengue virus 2	[129, 130]
Kaempferol 3-O-rutinoside, epicatechin	*Azadirachta indica*	Leaves	Inhibition of dengue virus 2	[131]
Gedunin, pigmol	*Azadirachta indica*	Leaves	Anti-dengue virus	[132]
Pinostrobin, pinocembrin, alpinetin, cardamonin, panduratin A	*Boesenbergia rotunda*	Rhizomes	Anti-dengue virus, dengue virus 2	[133–135]
Pareirarine, cissamine, magnoflorine	*Cissampelos pareira*	Flowers	Inhibition of dengue virus 2, 3	[93, 133–136]
Rutin, scopoletin	*Cladogynos orientalis*	Leaves, roots/stem	Anti-dengue virus, dengue virus 2	[137, 138]
Galatan	*Cryptonemia crenulata*	Alga	Anti-dengue virus, dengue virus 2, 3, 4	[135]
Curcumin	*Curcuma longa*	Rhizomes	Inhibition of dengue virus	[135, 140]
Pectolinarin, acacetin-7-O-rutinoside	*Distictella elongata*	Leaves, fruits	Anti-dengue virus 2	[93, 139]
Quercetin	*Hippophae rhamnoides*	Leaves	Anti-dengue virus 2	[93, 115, 135, 140]

Isolated compound	Plant species	Plant's part	Medicinal activity	Reference
Linoleum, limonene	*Lippia alba*	NS	Inhibition of dengue virus in Vero cells	[141]
Catechin, gallic acid, naringin, quercetin	*Psidium guajava*	Roots, leaves, bark	Anti-dengue	[142]
Baicalein	*Scutellaria baicalensis*	Root	Inhibition of dengue virus 1, 2, 3, 4	[143, 144]
Fucoidan, glucuronic, fucose	*Cladosiphon okamuranus*	Alga	Impede dengue virus 2; anti-dengue effect	[122, 145]
Azadirachtin	*Azadirachta indica*	Leaves	Anti-dengue virus 2	[130]
Castanospermine	*Castanospermum austral*	Seed	Anti-dengue virus 1,2,3,4	[118]
Chartaceones A-F	*Cryptocarya chartacea*	Bark	Anti-dengue virus 2	[146]
Betulinic acid 3 β-caffeate	*Flacourtia ramontchi*	Stem/bark	Anti-dengue virus	[147]
DL-galatan	*Gymnogongrus torulosus*	Red seaweed	Anti-dengue virus 2	[148]
α mangostin	*Garcinia mangostana*	Fruit	Anti-dengue virus 1,2,3, 4	[149]
Galactomannans	*Mimosa scabrella*	Seeds	Anti-dengue virus 1	[150]
Geranin	*Nephelium lappaceum*	NS	Anti-dengue virus 2	[151]
Catechin	*Psidium guajava*	Bark	Anti-dengue virus 2	[152]
Schisandrin A	*Schisandra chinensis*	NS	Anti-dengue virus 1,2,3, 4	[153]
Trigocherrin A1, A, B	*Trigonostemon cherrieri*	Bark, wood	NS	[124]
Hirsutine	*Uncaria rhynchophylla*	NS	Anti-dengue virus 1,2,3,4	[154]
Zosteric acid	*Zoster marina*	NS	Anti-dengue virus 1,2,3,4	[155]
Diallyl disulphide	*Allium sativum*	NS	Anti-dengue virus 2	[156]

Note: * when the concentration of *Houttuynia cordata* compound is used individually, the inhibition rate would be moderate but when combined with others, it will result in a greater rate of inhibition activity; *NS* not stated, *RdRp* RNA dependable RNA polymerase

3.4 Medicinal Plants for Treating and Managing West Nile Virus Disease

Medicinal plants with their isolated and purified organic products are rich resources of anti-virus which have been shown to target viral life cycles either as inhibitors of virus entry, prevention of replication, gathering, or release of virus [160]. West Nile virus is less lethal but its wild spread and re-emergence is posing a global health

Table 5 Isolated phytochemicals reported to be used in the treatment and management of West Nile virus

Isolated compound	Plant species	Plant's part	Medicinal activity	Reference
Delphinidin	NS	Flowers, fruits	Alteration of WNV virus replication, virucidal	[162]
Epigallocatechin	*Camellia sinensis*	Leaves	Alteration of WNV virus replication, virucidal	
Palmatine	*Coptis chinensis*	NS	Inhibition of NS2B-NS3	

Note: *NS* not stated, *WNV* West Nile virus, *NS2B* non-structural protease 2B, *NS3* non-structural protease 3

threat due to its asymptomatic characteristics; hence, Goh et al. [161] reported few phytochemical compounds that are capable of altering, preventing, and inhibiting West Nile virus (Table 5).

3.5 Medicinal Plants for Treating and Managing Yellow Fever

A few surveys of medicinal plants used by traditional medicinal herbalists used in the treatment and management of yellow fever showed about 95 species of plants in 52 families (Table 6). The bark and leaves of these plants are the most frequently used. The plants are reported not to only be cheap and affordable but prevent, and treat, yellow fever patients with acceptable tolerance and no serious side effects [163]. The majority of the African population are sceptical about receiving vaccines, especially in rural communities; hence, they prefer to treat and manage yellow fever with herbal medicine. For instance, *Cochlospermum tinctorium*, *Eucalyptus globulus*, *Mangifera indica*, and *Musa sapientum* are reported as medicinal plants for treating and managing yellow fever in some parts of Central and Northern parts of Nigeria. *Musa sapientum* is the most reported plant in the treatment of yellow fever. Other plants used in the treatment of yellow fever include *Azadirachta indica*, *Alstonia boonei*, *Anacardium occidentale*, *Carica papaya*, *Citrus aurantifolia*, *Senna occidentalis*, *Zingiber officinale*, and others [163].

3.6 Medicinal Plants for Treating and Managing Zika Virus Disease

A few medicinal plants evaluated against Zika virus are *Berberis vulgaris* which contains berberine compound and *Rheum palmatum* and *Coptis* species, which contain emodin compound. These compounds have been shown to be virucidal, reducing about 80% of virus infectivity in Vero cells. Emodin, for instance, can block the entry of viruses and inhibit the processes associated with viral particle release from cells [166] and also has a modest effect as a pre-treatment medicine by

interfering with virus entry [167]. At low concentrations, berberine and emodin are effective prophylaxis agents as berberine has the potential to spread to organs (liver, kidneys, brain), and muscles, and can remain in those places [168], which is a preferred distinction needed in the treatment and management of Zika virus [167]. Berberine is also reported to have low toxicity as no serious side effects have been reported in humans [169–171]. Thus, berberine and emodin phytochemical compounds are considered for their virucidal effect and impair Zika virus particles in vitro study. In endemic regions, both berberine and emodin are acceptable recommendations for the prevention, treatment, and management of patients infected with the Zika virus [167].

Apart from the general reports that plant products (polyphenols, flavonoids, alkaloids, terpenes, and others) have strong potential to inhibit the replication of the Zika virus, some isolated phytochemical compounds (Table 7) have been reported to work against Zika virus in humans. For instance, curcumin which is a phytochemical compound from *Zingiber officinale*, has been shown to have a strong potential against the Zika virus by possessing inhibiting potential on the viral envelope and can be very useful, especially during outbreaks of Zika infection [162, 172]. Similarly, phytochemical extracts and compounds isolated from seaweed plants are evaluated for anti-Zika virus prospect [173] while another study [174] reported that *Aphloia theiformis* extracts affected the organization of Zika virus particles severely, based on electron microscope examination.

4 Recent Updates on the Use of Medicinal Plants in the Treatment and Management of Mosquito-Borne Viral Diseases

Plants have emerged as credible candidate for replacing synthetic drugs. Hence, their discovery is a major boost to the fields of pharmaceutical chemistry and microbiology, herbal sciences, and humanity at large. Several plants have been reported to be active in the treatment of several diseases, especially those caused by microbes [176–195]. Viruses are seen as microbes in the field of microbiology, and the use of

plants for the treatment of diseases caused by viruses has been a mere claim until now.

Basic scientific inquiries on the use of medicinal plants in the treatment and management of mosquito-borne viral diseases have been accentuated within the last few years due to viral infections such as COVID-19 and Ebola virus diseases leading to global pandemics and epidemics in some West African countries, respectively. Hence, many medicinal plants are depicted to have reasonable secondary metabolites against viral diseases. Empirical reports about isolated phytochemical compounds from medicinal plants which have performed optimally in many medical experiments have been reported. Thus, the formation of novel medicine from phytochemical constituents and plant-isolated compounds is beginning to be a major part of treating mosquito-borne viral diseases, especially in developing countries.

Based on the research reports succinctly discoursed above, it is glaring that a greater percentage of the population in the tropics use plant-based medicine as a basic form of their healthcare. Reasons for this practice are but not limited to the cost and safety of plant-based medicines which have been used by the generations past with little or no negative reports, culture and religious beliefs, inaccessibility of orthodox medicine due to higher cost, lack of primary healthcare centres, and trained professionals especially in rural communities [196]. Fortunately, a greater percentage of infected victims survive upsurges of viral infections (epidemics and pandemics) by relying on plant-based medicines which have drawn the attention of researchers to understudy the potentials of these plants that are used to treat and manage mosquito-borne viral diseases. In West Africa alone, about 124 species in 50 families of medicinal plants are reported to have antiviral properties including viral diseases transmitted by mosquito species, hence concurring with a report of higher medicinal plant diversity in the tropics [197–199].

Recent updates on the use of medicinal plants in the control [200–204], treatment, and management of mosquito-borne viral diseases are showing that about 52% which translate to 65 out of the 124 species are the ones that have been scientifically ascertained to have therapeutic potentials against mosquito-borne viral diseases especially dengue and other non-mosquito-borne viral diseases [196]. Progressively, 4 of the 65 plant species have their essential phytochemicals such as flavonoids, quercetin, morin, fisetin, naringenin, and hesperidin from *Citrus aurantifolia* and *Citrus paradise*. Alkaloids such as salidroside 2(4-hydroxyphenyl) from *Cucumis metuliferus* and ethyl β-D-glucopyranoside from *Loranthus micranthus*. Flavonoids (3,5-dicaffeoylquinic acid, acteoside, kaempferol 7-O-glucoside, bastadin-11) and stilbenes (vedelianin, schweinfurthin G, mappain) from *Macaranga barteri* are identified and isolated compounds responsible to potentially having countering activity against viral diseases. Other natural antiviral compounds isolated but not from plants such as mushroom (*Hypoxylon fuscum*) and lichen (*Ramalina farinacea*) include dihydropenicillic acid and sekikaic acid, respectively, with all the structures presented for further investigation and possible replication and production for treatment and management of viral diseases, including mosquito-borne viral diseases [196].

The use of medicinal plants in the treatment of mosquito-borne viral diseases is, therefore, becoming famous due to the bioactive compounds which are a very rich source of pharmaceuticals that contain reasonable antiviral properties. Hence, the World Health Organisation (WHO) and other traditional-based medicinal professionals have proposed that using medicinal plant extracts and their isolated compounds have been very useful in dealing with diseases especially dengue and other related viral diseases [205]. The WHO has gone ahead to consider isolated compounds from medicinal plants to be largely safe, non-toxic, and by comparison, assumed to be less harmful, and cheaper than orthodox medicines against viral diseases [205]. Currently, many researchers are scientifically exploring medicinal plants in an attempt to identify the active compounds that have antiviral properties since many of the secondary metabolites of the medicinal plants have been widely reported to have been used to treat and manage many viral ailments including mosquito-borne diseases such as chikungunya, dengue, Japanese encephalitis, West Nile fever, yellow, Zika, and others [206, 207].

5 Conclusion

Mosquito-borne diseases are contributing to a greater percentage of deaths in the world especially in the tropics, with their emerging and re-emerging infections being an untiring peril to the human population. Mosquito-borne diseases especially viral infections are seriously challenging the survival of the human population, especially children, gravid mothers, and immune-compromised adults. Mosquito-borne viral diseases remain one of the major causes of deaths globally with leading records of outbreaks in the human population and epizootic in non-human vertebrates. Mosquito-borne viral infections have caused severe economic problems in the tropics and subtropical regions of the world but are more endemic in Africa, America, Asia, Eastern Mediterranean Province, and Western Pacific. Regrettably, some of these diseases are prevalent in urban and semi-urban cities and are spread and transmitted by infected female *Aedes*, *Anopheles*, and *Culex* species. Symptomatic cases are generally presented with febrile characteristics, and their treatments vary depending on the orthodox therapeutic agents available. However, orthodox medicines are beginning to fail to meet the required expectations.

Presently, there are reports that medicinal plants and their bioactive compounds are effective against viral infections by either reducing viral loads or inhibiting viral multiplication. The diversity of the reported medicinal plants is very high in the tropics; thus, they have been used in the ancient days till now by herbalists who inherited or learned the art of using such plants to treat different ailments. Hence, a greater percentage of people in the tropics rely mainly on medicinal plants to treat and prevent diseases including mosquito-borne viral infections. Based on folklore and testimonies of patients and herbal medicinal practitioners, medicinal plants in the tropics could be a major source of producing natural antiviral medicines. Many medicinal extracts from various parts of plants such as leaves, flowers, bark, roots, stems, seeds, and whole plant and their isolated phytochemicals have been extensively reported to have reasonable antiviral properties based on; in vitro and in vivo studies. These empirical reports are corroborative of folkloric reports of medicinal plant potentials, which are used in dealing with viral infections and thus form the basis of recent reports of the use of medicinal plants to treat and manage mosquito-borne viral diseases in the tropics.

Medicinal Plants in the Tropics Used in the Treatment and Management of Parasitic Diseases Transmitted by Mosquitoes: Administration, Challenges, and Strategic Options for Management

14

Maduamaka Cyriacus Abajue and Michael Ndubuisi Wogu

Contents

Abstract

Mosquitoes are highly diversified insect group, globally distributed, and carry and transmit parasitic infections that are recognized threats to the world public health. Infections such as lymphatic filariasis and malaria are caused by filarial nematodes (*Wuchereria bancrofti*, *Brugia malayi*, and *Brugia timori*) and protozoans (*Plasmodium falciparum*, *P. vivax*, *P. ovale*, *P. malariae*, and *P. knowlesi*), respectively, which are transmitted to humans by mosquitoes. Filarial parasites are transmitted to humans and are spread by infected female mosquitoes (*Anopheles*, *Culex*, *Aedes*, *Mansonia*) while malaria parasites are spread and transmitted by infected female

Anopheles mosquitoes to humans. Over 1.4 billion people in about 73 countries are at risk of lymphatic filarial infection while about 3.4 billion people in about 97 countries are at risk of malaria, contributing to about 90% of malaria deaths in developing countries. Orthodox means of treating the diseases have encountered some setbacks due to drug resistance, cost, accessibility, and other logistics, hence becoming necessary to employ sustainable and affordable alternatives. In this chapter, we shall emphasize entomological approach to managing mosquito-borne diseases which is rooted in controlling mosquito species at different stages of development. For the disease-causing parasites, various extracts of medicinal plants which are abound in the tropics and reported to have anti-filarial and anti-plasmodial properties shall be succinctly discussed. Biodiversity loss occasioned by continuous harvesting of plants and root structures, inefficient scientific production tools, paucity of documented data on medicinal plants, and lack of subsidy from government and other stakeholders shall be highlighted as some of the challenges against the use of medicinal plants for the treatment and management of mosquito-borne parasitic diseases. We shall also espouse strategic options such as creation of platforms that will link the health sectors in the ministry of health with traditional medicine practitioners in a view to establishing a reliable and responsive national agency that will protect plant-based medicines and her members. Also, to champion a common front for acceptance of plant-based medicines, product patency, and advocate for sustainable gathering of medicinal plants in the tropics is highly needed.

1 Introduction

Mosquito-borne parasitic diseases are illnesses that are caused by parasites found in human populations which are transmitted from animal to humans or from human to humans by mosquito species. More than one billion people globally contract mosquito-borne parasitic diseases that cause about one million deaths every year. Mosquito-borne and other vector-borne diseases contribute about 16.66% of illnesses and disabilities suffered by children and pregnant women especially the poorest people in the society living in the developing countries [1]. Mosquito-borne parasitic diseases affect both urban and rural villages but most prevalent in villages that lack adequate living conditions such as housing and sanitation and more devastating for those with compromised immunity.

Mosquito is an insect with jointed legs, a pair of wing, and a modified mouthpart for sucking of blood of vertebrate animals including humans. Many female mosquito species are capable of transmitting infectious diseases between humans or from animals to humans. Thus, female mosquitoes are the most dreadful insects that transmit debilitating diseases to man and animals. They harbour infectious parasites such as protozoa, and nematodes in their midgut, which are transmitted from their salivary glands to their hosts (human beings and other vertebrate animals) when sucking their blood. The transmitted parasites (filariae and plasmodia) as outlined in (Fig. 1) cause filarial and malaria diseases, respectively, to man [1] and are known as mosquito-borne parasitic diseases.

Based on disease control (prevention, treatment, and management), medicinal plants are carefully selected from groups of plants which have been utilized in the tropics for years, for treatment and management of diseases from the ancient time till now. In traditional medicine, herbs and plant products are still being used mainly in Africa, Asia, and Latin America, and their use is currently extending to Australia and the USA. Inference from traditional medicine practitioners shows that the use of medicinal plants against diseases such as mosquito-borne parasitic diseases is economical, simple to use, easily accessible, and cheap while synthetic drugs require a lot of time, resources, and efforts (design and validation) from the onset. Plants are reported to have natural compounds in them which are anti: viruses, bacteria, protozoa, nematodes, fungi, oxidant, inflammatory, and carcinogenic [2–4]. Chemical compounds found in plants are generally known as phytochemicals and are secondary metabolites that protect plants against UV radiation, microbial infection, and insect attack [5], hence their use in the treatment and management of insect-borne parasitic diseases.

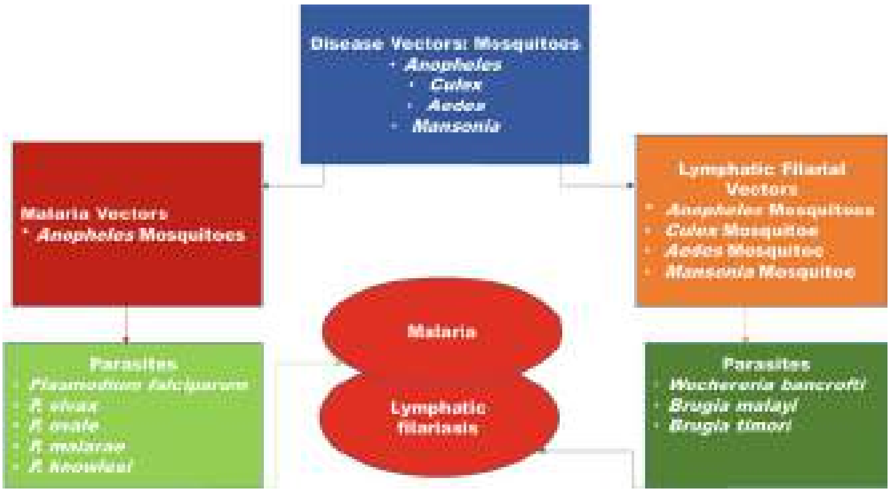

Fig. 1 Overview of mosquito-borne parasitic diseases and their vectors in the tropics

Some approaches employed in dealing with mosquito-borne diseases involve killing or repelling the mosquitoes with synthetic insecticides. Insecticides may be used to lace bed nets or spray the habitable homes. However, the use of insecticides impact negatively on the environment while the mosquitoes develop resistance to the killing powers of the insecticides. Mosquitoes' resistance to insecticides is a major factor driving against mosquito-borne diseases control strategies. Therefore, efforts are on for reasonable alternative remedies to deal with the population of mosquitoes at all stages of their life development. The most voted alternative is to use plant materials to control mosquitoes. Many researches have reported that some plants have the potentials to kill the larval or the adult stages of mosquitoes. For instance, natural products isolated from Chinese herbs and synthetic analogs of *Curcumin* killed the larval stages of *Aedes aegypti* [26]. Similarly, plants such as *Aframomum melegueta*, *Alstonia boonei*, *Croton zambesicus*, and *Newbouldia laevis* are reported in Nigeria as mosquito larvicidal agents [16] which are to be championed in researches related to management of mosquito-borne disease vectors. By extension, the management of mosquito-borne diseases may have been inspired by evidential reports of plasmodial resistance to malaria drugs from the quinines, chloroquinines, and now artemisinin combination therapy, thus requiring that new and affordable alternatives should be sought for. Thus, plant-based medicines stand a high chance of consideration in pursuant of novel mosquito-borne disease management that are rooted to natural resources.

Africa and countries in the tropics have a diverse range of medicinal/herbal plants which are used by traditional medicine practitioners or herbalists. However, there is a paucity of documented data of such medicinal plants from the tropics in open access literatures. In this chapter, we shall look at different reports of traditional medicines against mosquito-borne diseases in Africa and other countries in the tropics. A concise review of scientific evaluation and validation of medicinal plants that have therapeutic and prophylactic properties against parasite-causing diseases such as lymphatic filariasis and malaria shall be presented. Though few reports have shown that many plants in the tropics have various medicinal properties, this section will, therefore, limit discussion to mosquito-borne parasitic diseases such as lymphatic filariasis and malaria. The use of medicinal plants that are abound in the tropics to treat mosquito-borne parasitic diseases shall form the basis of discussion. Elaborate emphasis on phytochemicals and isolated compounds from the plants which have therapeutic and prophylactic potentials against mosquito-borne parasitic diseases (lymphatic filariasis and malaria) shall be highlighted as well. The subsequent section will highlight different preparation methods and administration of medicinal plants in the treatment and management of lymphatic filariasis and malaria, respectively.

2 Overview of Distribution of Mosquito-Borne Parasitic Diseases in the Tropics

Mosquito-borne parasitic diseases are previously envisaged as a peculiar problem in the tropical countries, but today, they are recognized threats to global public health because of mosquito diversity and their geographical spread, hence culminating to different human and animal diseases. Mosquito-borne parasitic diseases are globally spreading due to climate change, pattern of land use, and the continued increase in number of people moving from one country to the other, hence threatening almost half of the global population. Mosquitoes are responsible for majority of the vector-borne parasitic diseases in about 125 countries of the world especially in the tropics [6]. For instance, malaria prevalence alone in the world is estimated at 3.3 billion, and in India as a reference point, it causes about 1.85 million disability adjusted life per year, affected 1.95 million people between 2012 and 2013, while lymphatic filariasis affected 6 million people, thus impacting the socio-economic development of developing countries [7].

2.1 Lymphatic Filariasis

Lymphatic filariasis is commonly known as elephantiasis as a result of a man's skin being thickened and hardened because of excessive swelling due to lymphedema (lymph accumulation). This characteristic lymphedema is commonly obvious in the lower limbs and may affect the breasts, arms, and scrotum, hence making the disease one of the most painful and regrettably disfiguring disease. The disease is caused by round parasitic worms known as filariae (phylum Nematoda). There are three types of filariae (*Wuchereria bancrofti*, *Brugia malayi*, and *Brugia timori*) but *W. bancrofti* is responsible for about 90% of the disease [8]. Filarial parasites are likely to be the only multicellular organisms capable of infecting man with a debilitating disease. Filarial parasites are transmitted and spread by mosquitoes (*Anopheles*, *Culex*, *Aedes*, *Mansonia*) when they take up the microfilariae (the first larval stage of the filariae) in the bloodstream of man during blood feeding. These microfilariae will moult twice to become adult larvae (infective third larval stage) in the gut of mosquitoes which will then be transmitted to man during blood meal by an infected mosquito. The infective adult larvae wriggle into the tissues and enter the lymphatic vessels where they undergo two moults to become reproductive adults (males and females). The reproductive adults exchange their gametes during mating to produce microfilarial larvae which enter the bloodstream of man and are taken up by other uninfected mosquitoes for development [9].

Over 1.4 billion people in about 73 countries are at risk of lymphatic filariasis while more than 120 million of lymphatic filariasis have been reported, with about 40 million of them showing clinical symptoms [10, 11]. Among the total infected people, 40 million live in Africa and India, respectively, while South East Asia, Pacific, New Guinea and America share the remaining [12]. Endemicity of the disease is highest in Africa with about 39 countries having an estimated 390 million people being at risk of infection [13]. Lymphatic filariasis causes a devastating health challenge in addition to its socio-economic burden on infected population. It also causes acute and chronic morbidity among the people living in tropical and sub-tropical countries in Africa, Asia, Western Pacific, and parts of America, with its awful social significance [14]. The disease occurs when filarial parasites (nematodes) are transmitted to humans through a bite of infected mosquito species (*Aedes* spp., *Anopheles* spp., *Culex* spp., and *Mansonia* sp.). The parasites can live in the lymphatic system of an infected human between 6 and 8 years, produce millions of microfilariae that spread in the bloodstream, and significantly disrupt/weaken the immune system.

Lymphatic filariasis mostly presents no immediate identified symptoms but mutely damages the lymphatic system, kidneys, and immune system. Acute cases of lymphatic filariasis cause local inflammation on the skin, lymph nodes, and lymphatic vessels usually associated with tissue swelling known as lymphedema. Lymphatic filariasis occurs mainly in childhood but the pitiable symptom or condition is noted later or manifests in adulthood especially in males. The disease disorder is associated with damage of the lymphatic system, arms, legs, and genitals. These pitiable conditions cause severe pains, loss of optimum productivity, and social exclusion/stigma. Thus, 40 million out of the 120 million infected people with lymphatic filariasis are already defaced, disabled, and socially excluded.

The disease is known to upset over 25 million men mainly with genital disease, and over 15 million are with lymphedema. The South-East Asia region has the highest share of the disease at 65% while the African region has 30%, and other tropical areas share the remaining 5%. Different mosquito groups such as *Culex*, *Anopheles*, and *Aedes* are responsible for transmitting the filarial worms. *Culex* mosquitoes are the main culprit with a widespread distribution across urban and semi-urban areas. *Anopheles* are capable but mainly in rural areas while *Aedes* are responsible in the Pacific Islands and some parts of the Philippines [1].

2.2 Malaria

Malaria is a disease caused by protozoan parasites in the genus *Plasmodium* which accentuates fever, chills, a flu-like illness, and other symptoms. The symptoms are usually manifested in individuals, at least 7 days after exposure to bites of infected mosquitoes. A particular report showed that about 207 million people were down with malaria in 2012 alone, thus leading to unfortunate death of 627,000 of them. However, death rate is said to be decreasing by 42% in the world and 49% in the WHO region of Africa due to increase in prevention and control strategies by government and non-government organization. Nevertheless, about 3.4 billion people in about 97 countries of the world are at risk of malaria infection. Unfortunately, its burden is extremely peaked in sub-Saharan Africa and contributing to about 90% of malaria deaths. For instance, the Democratic Republic of the Congo and Nigeria are the countries with the highest burden of malaria, where four among ten malaria-infected patients die of the disease [1]. Moreover, young children, gravid women, HIV patients, internally displaced persons (IDPs), and non-immune migrants are mostly at risk of malaria infection. The poorest people living in remote villages where access to healthcare facilities is lacking are the most vulnerable to malaria infection.

Hitherto to the report above, about 40% of the world population is at risk of malaria, with half of the estimated 1.2 billion people that are at high risk of transmission found in Africa. They are concentrated in 13 countries with Nigeria, Congo, Ethiopia, Tanzania, and Kenya having over 50% of the cases [15] with Nigeria alone parading 25% of the cases. Malaria occurs all through the year in Southern Nigeria but seasonal in the northern region. *Plasmodium falciparum* (one of the protozoan parasites) is depicted as the major cause of malaria in Nigeria and responsible for malaria death cases. Thus, the estimated malaria cases in Nigeria as at 2006 in every 1000 individuals was 397 leading to 16 deaths and 3.9 fatality [16]. Reports have shown that malaria as a case study is still a global burden with over 3.4 billion people estimated to be at risk. The approximately 207 million cases of malaria recorded in 2012 with 80% of them occurring in Africa is an indication that the disease is though a global burden but more prevalent in the sub-Saharan countries. Hence, about 90% of infected persons in Africa don't survive the disease and 70% of them are children who are less than 5 years [17]. In 2019, about 229 million new cases were reported globally, out of which 409,000 of the patients died with about 94% occurring in the WHO African region. Demographically, the prevalence is more in pregnant women with 16.3% and children 0.6% [18–20]. Countries like Botswana, Namibia, Swaziland, Zimbabwe, and South Africa have approximately 15 million people that are at risk but 10 million of them are at a higher risk with 437 deaths [21].

Mosquito species such as *Anopheles arabiensis* is the main vector of *Plasmodium* responsible for transmission of malaria in the region. Female anopheline mosquito species are the vectors of five *Plasmodium* species (*Plasmodium falciparum*, *P. vivax*, *P. ovale*, *P. malariae*, and *P. knowlesi*) that are causing malaria in humans. *Plasmodium falciparum* and *P. vivax* are the most common but *P. falciparum* is more problematic with the highest rates of complications and mortality especially in sub-Saharan Africa [1]. *Anopheles gambiae* and *A. funestus* are the main vectors of malaria plasmodia species (*Plasmodium falciparum* and *P. vivax*) which are the deadliest parasites in sub-Saharan Africa [22].

3 Diversity of Medicinal Plants Used in the Treatment and Management of Mosquito-Borne Parasitic Diseases in the Tropics

Based on mosquito biology and ecology, the authors of this chapter who are inclined in entomology and parasitology, respectively, are propelled to describe mosquitoes as the most deadly insects existing on earth. The description is in connection with many debilitating diseases they transmit globally to over one billion people every year. Mosquitoes are vectors of many diseases such as malaria, dengue, yellow fever, lymphatic filariasis, chikungunya, Japanese encephalitis, West Nile fever, zika, and others which are collectively killing over one million people globally on a yearly basis. Management of mosquito-borne diseases is geared towards its vector (mosquito species) control and elimination at different stages of the vectors' development. Thus, larvicidal activity of six Indian plants against *Aedes aegypti* and *Anopheles stephensi* has been reported [23]. Others include larvicidal and ovicidal potentials of *Eclipta alba* against *Aedes aegypti* and leaf and seed extract of *Delonix elata* against *Anopheles stephensi* and *Aedes aegypti* [24, 25].

3.1 Lymphatic Filariasis and Medicinal Plants Used for Its Treatment

The diversity of medicinal plants against lymphatic filariasis, in particular, is estimated at 46 plant species, and many of them have the potentials to work against filarial infection in man [27]. Just like other herbal remedies against mosquito-borne diseases, the parts of plants used mostly to treat lymphatic filariasis are leaves, barks, roots, stems, bark and bulb but herbalists claim that active phytochemicals of the plants are concentrated in the roots underground [28, 29]. Extracts of medicinal plants (*Azadirachta indica*, *Polyalthia suaveolens*, *Andrographis paniculata*, *Bauhinia racemosa*, and *Haliclona oculata*) and others (Table 1) have shown to exert bio-efficacy through immunomodulatory elicitation response, either as alone treatment or as adjuvant [30]. The demand for medicinal plant-based formulations is increasing, hence culminating to studies that have ascertained the molecular structures and isolated phytochemicals (Table 2), which are effective against lymphatic filariasis. This has given rise to a scintillating impulse at which isolation of active compounds are top priority to meeting the pharmaceutical requirements to alternate or compensate the synthetic formulations against lymphatic filariasis.

3.2 Malaria and the Medicinal Plants Used for Its Treatment in the Tropics

Many tropical plants are endowed with phytochemical compounds which are bioactive agents that are effective against many ailments such as malaria. The phytochemicals (alkaloids, flavonoids, and terpenoids) are schizonticides. Anti-malaria activity of medicinal plants in the tropics especially the alcoholic-based extracts have been consistent in the reports of traditional medicinal herbalists [56]. It is noted that alkaloids target the apicoplast in the plasmodial parasites and inhibit their protein synthesis, while flavonoids obstruct the invasion of myoinositol and L-glutamine produced in an infected erythrocytes [57]. They can as well accelerate the level of erythrocytic oxidation, prevent the *Plasmodium* from synthesizing proteins, and prevent fatty acid biosynthesis [58]. In vivo screening for anti-malaria of 15 plant species against plasmodial parasites (*Plasmodium berghei*, *P. yoelii*) are reported to be active and successful. However, in in vivo studies, lower doses are reportedly not efficient as they can only suppress *Plasmodium* load at a higher dosage [16]. *Azadirachta indica* which is one of the widely used medicinal plants for different diseases was reported to deal with all the stages of maturation of plasmodium development by releasing oxidative stress on plasmodial gametocytes. Similarly, *Picralima nitida* plant has a reasonable in vivo anti-malaria action against early and old malaria infections while hexane extract of *Cocos nucifera* dealt with

Note: * = not plant but sponges

P. falciparum and *P. berghei* in both in vivo and vitro studies [59]. Empirically, these medicinal plants have reputable anti-malaria properties in in vitro experiment but not too strong in in vivo study except when the dosages are higher, which therapeutically are not meaningful [16].

To cut down on resources and time wastages on assumed medicinal plants, traditional medicinal herbalists and the old native people are usually consulted for anti-malarial plants. In one such consultations, 16 species of plants used by traditional medicine herbalists and the natives were beneficial as their voted anti-malaria plants, were chemically evaluated and proven to contain different phytochemicals (fagoronine, palmatine, jatrorrhizine, picraline, astonine, gendunin, meldenin, and others) that are anti-plasmodial; hence, they have been isolated and characterized [16]. Table 3 showcases some of the isolated and characterized phytochemicals contained in different medicinal plants, which are reported as effective remedies against malaria-causing parasites.

Phytochemicals contained in the plants include alkaloids, flavonoids, quassinoids, limonoids, terpenes, chalcones, coumarines, and others [76]. The concentration of these compounds is dependent on the solvents used to extract them. For instance, methanol extract yields more chemicals than water extract because it contains lipophilic compounds [77]. Hence, concentration of the chemicals determine how effective they will be against plasmodial parasites. Secondary metabolites of these chemicals are synergistically more effective against plasmodial parasites. The synergy of the compounds contained in a plant confers them with anti-malaria property, pointing that any plant without anti-plasmodial activity lack active metabolic compounds [78]. Medicinal plants used in the treatment of malaria in Uganda, for instance, are effective against malaria parasites and possess low level of toxicity such as leaves of *Artemisia annua*, *A. africana*, and all plant parts of *Carica papaya* and *F. virosa*. Those with high toxicity are that of petroleum ether leaf extract of *V. amygdalina* and dichloromethane leaf extract of *Microglossa pyrifolia* [79, 80].

In Africa, medicinal plants used in the treatment of malaria and other mosquito-borne diseases are not regularly documented and regulated by appropriate

professional body or governmental agencies but still, traditional herbs and herbalists are being patronized for primary healthcare in relation to treating malaria symptoms. Providing and making documentations for medicinal plants that are used for prevention and treatment of malaria and other mosquito-borne diseases in the tropics would create a reasonable step to preserving and improving access to the use of medicinal plants. The goal of documenting medicinal plants used in the treatment of malaria disease will expedite prospective studies on the security and usefulness of medicinal plants and can provide a base for classifying particular chemical characters with anti-malaria activity which could be central in the development of standardized phytomedicine [21]. It has become imperative to search for organically alternative approach for the treatment of malaria since the causative agents (*Plasmodium* species) and the vectors (*Anopheles* species) have developed resistance to many treatment drugs and insecticides, respectively. Chloroquine resistance, for instance, is due to misuse while artemisinin combination therapy is a good and available option for treating malaria but quinolones (quinine, chloroquine, and mefloquinine) are known to cause cardiotoxicity. *Plasmodium* has also been reported to develop resistance to artemisinin combination therapy [81, 82].

In Nigeria, *Icacina senegalensis* Juss which undergone methanolic extraction competed favourably against chloroquine by suppressing about 80% of *P. berghei* while chloroquine suppressed about 92% of *P. berghei* after 5 days of mice infection with *P. berghei.* Though *I. senegalensis* for now has not been characterized, its anti-malaria potency was attributed to having alkaloids, flavonoids, and terpenes which are phytochemicals depicted to have anti-plasmodial agents [83]. Again, ethanolic leaf extract of *Pseudocedrela kotschyi* has been evaluated in; in vivo experiment for anti-malaria potential. Hence, the plant extracts were able to suppress and cure mice of *Plasmodium berghei berghei* infection at different dosages as the lethal dose of the extract was ascertained at 5000 mg/kg without acute toxicity. By comparison, the leaf extract at 400 mg/kg suppressed *P. berghei berghei* parasitaemia at 91% against chloroquine at 10 mg/kg which suppressed 94% of the *P. berghei berghei* parasitaemia density after 5 days of mice exposure [56]. In Western Nigeria, some authors [84] reported 37 species of plants in 25 families, which traditional herbalists have used to treat insect-transmitted diseases. Based on plant parts used, leaves constitute the most utilized parts at 43.2%, while bark is 32.4%, a whole plant is 10.8%, fruits and seeds are 5.4%, while root and whole plant are 7%. Both fresh and dry plants are used except occasionally where fresh is preferred [84]. In Southern

Note: *NS* not stated

Nigeria, malaria transmission is experienced all through the year because it is a rain forest region that is characterized with a humid tropical climate. Thus, it supports greater number of plant diversity including medicinal plants that the natives and traditional medicinal herbalists use for different ailments. According to a review report [16], 24 plant species have been tested in in vitro studies and were found to have anti-plasmodial properties and low cytotoxicity values. *Nauclea latifolia*, for instance, was reported to inhibit *Plasmodium falciparum* erythrocytic cycle towards the last phase of schizogony between 32 and 48 h. To break some logistic barriers in the experimentation of medicinal plants against malaria, developing countries like Nigeria occasionally collaborate with foreign laboratories to conduct some in vitro and vivo studies to close the gap of lack of requisite laboratories in their native countries [16].

In Zimbabwe, 28 species of plants were reported to have anti-malaria properties but only 26 were taxonomically identified in 16 families [21]. Detailed analysis show that out of the 26 species, 38.5%, 30.8%, 23.0%, and 7.7% are trees, shrubs, climbers, and herbs, respectively. Twenty of the 26 species have anti-malaria (therapeutic) properties, 4 have preventive (prophylactic) properties, while the remaining 2 species serve the dual purpose. Among these species, only *Momordica foetida* and *Capsicum annuum* can be cultivated while others can only be harvested from the wild, a scenario that could lead to loss of biodiversity. Interesting report directly from the traditional medicine healers stated that some plants such as *Euclea natalensis* (Ebenaceae) may not have therapeutic or prophylactic values but may be added to boost strength and increase appetite in malaria patients [21].

In Ethiopia, 51 species of medicinal plants in 28 families against malaria have been reported with the family Fabaceae, Asteraceae, Euphorbiaceae, Aloaceae, Alliaceae, and Meliaceae having 6, 5, 4, 3, 3, 2, and 2 species, respectively, while other family members have 1 species each. Among these medicinal plants against malaria, *Allium sativum*, *Croton macrostachyus*, *Carica papaya*, and *Lepidium sativum* are the most frequently used plants to treat malaria [85]. Phytochemical compounds such as alkaloids, terpenes, limonoids, chromones, xanthones, flavonoids, and anthraquinones have been reported to be successful in the treatment of malaria. Anthraquinones and naphthalene derivatives are the most reported compound against malaria. These compounds are effectively reported in in vivo and vitro studies at 61% and 39%, respectively, against *Plasmodium falciparum* [85].

In Uganda, about 182 species of medicinal plants in 63 families, which have anti-malaria properties, but only 17 species are frequently used in malaria healthcare. The leaves constitute the highest parts that are used at 54.4%, and followed by roots at 17.4%, bark at 16%, while whole plant and other parts constitute 12.2% [86]. Among the 182 species of medicinal plants, 112 have been evaluated for treatment of malaria, but 108 were ascertained to be effective for malaria treatment.

In Ghana, 422 species of medicinal plants in 25 families that are highly diversified are reportedly used in malaria treatment, with Euphorbiaceae constituting 14.3%, Asteraceae 9.5%, and Poaceae and Fabaceae having 7.1% each as the most used families [87]. Trees are mostly used at 42.9%, herbs 28.6%, shrubs 16.7%, grasses 7.1%, and climbers 2.4%. About 75% of the plant materials are collected from the neighbourhood surroundings, while 25% are harvested from the wild and elsewhere. Based on plant parts used, leaves constitute 80%, fruits 13.3%, stem-bark 4.4%, and flowers 2.2%. Threats to medicinal plants include drought, farming, over harvesting, bush fire, and others [87].

In Kenya, 286 plant species in 75 families are reported to be useful in the treatment and management of malaria with Asteraceae, Fabaceae, Lamiaceae, Euphorbiaceae, Rutaceae, and Rubiaceae families. The percentage use of these listed plant families are 36.5%, 29.7%, 24.3%, 21.6%, and 17.6%, respectively [22]. Plant parts used are shrubs, trees, herbs, roots, bark, root-bark, and stem-bark at 33.2%, 30.1%, 29.7%, 19.4%, 10.8%, 10.5%, and 6.9%, respectively, hence similar to reports from other African countries. No serious report of threat associated with leaves usage but root and root structures (tubers and rhizomes) are potentially driving the plants to extinction not minding reports that plant parts below the ground contain more phytochemicals.

From the time immemorial, medicinal herbs have been used to treat malaria in Africa and other tropical countries. Medicinal plants are abound in the tropics with higher concentration of organic chemicals that have been used for treatment of malaria (Table 4). For instance, quinine and artemisinin are isolates of *Cinchona* and *Artemisia* plants that are natives to sub-Saharan Africa. Thus, the first plant-based anti-malaria drug was extracted from *Cinchona* plant as quinine in the form of alkaloid as reported by Baird et al. [88] and was later isolated and characterized (Saxene et al. 2003). Later in the nineteenth century, another medicinal plant *Artemisia annua* became another source of malaria treatment known as artemisinin which was combined with other therapies and referred to as artemisinin-combined therapy (ACT) [89]. This approach of malaria treatment has been the medically approved treatment in Nigeria since 2005 [90]. However, a lot of factors of production militate against artemisinin combination therapy production and therefore, the drug remains expensive that many people in the developing countries cannot afford it. It is therefore imperative that plants from the tropics especially in sub-Saharan African regions should be screened for anti-malaria properties since greater percentages of malaria death cases occur in the regions.

4 Preparations and Administration of Herbal Medicine Used in the Treatment of Mosquito-Borne Parasitic Diseases in the Tropics

Some of the parts of the medicinal plants used in the treatment of malaria disease are processed into powder and preserved in closed bottles. When in need, the powder is either soaked in cold or hot water to extract the active ingredients. After a while, the water is decanted or sieved and given to a malaria patient to drink. To make concoctions from the powders, the recommendations are usually a full, half, or quarter of either teaspoon or tablespoon or may be a pinch. The concoction is either prescribed to be taken twice or thrice a day as from 3 to 7 days or till the patient is certified healed. Where some fruits are to be used, they are swallowed whole. For instance, the fruit of *Capsicum annuum* (*Capsicum frutenscens*) is given to a patient to swallow without chewing because of its bitterness. In some case, especially for preventive measures, some leaves are eaten as vegetables such as *Momordica balsamina* and *M. foetida* [21].

Table 4 Medicinal plants reported in Africa for the treatment of malaria

Plant family	Plant species	References
Acanthaceae	*Justicia betonica*	[86, 91]
	Justicia anselliana	[86]
	Monechma subsessile	
	Thunbergia alata	
Alliaceae	*Allium sativum*	[16]
	Allium cepa	[86]
	Aloe kedongensis	
	Aloe volkensii	
	Aloe ferox	
	Aloe lateritia	
Aloeaceae	*Aloe dawei*	
Amaranthaceae	*Amaranthus hybridus*	
Anacardiaceae	*Anacardium occidentale*	[16, 91]
	Mangifera indica	[16, 86, 91]
	Rhus natalensis	[86]
	Rhus vulgaris	
Annonaceae	*Uvaria chamae*	[16]
	Xylopia aethiopica	[91]
	Annona senegalensis	[16]
	Enantia chlorantha	[16, 91]
Apiaceae	*Heteromorpha trifoliata*	[86]
	Centella asiatica	
	Carissa edulis	
	Carissa spinarum	
Apocynaceae	*Catharanthus roseus*	
	Funtumia africana	[16, 91]
	Picralima nitida	[16]
	Rauvolfia vomitoria	[91]
	Alstonia boonei	[16, 86, 91]
	Rauvolfia vomitoria	[16]
Araceae	*Culcasia faleifolia*	[86]
Aristolochiaceae	*Aristolochia elegans*	
	Aristolochia tomentosa	
	Cryptolepis sanguinolenta	[16]
Asclepiadaceae	*Gomphocarpus physocarpus*	[86]
	Pergularia daemia	[91]
	Aloe vera	[86]
Asteraceae	*Aspilia africana*	[16]
	Ageratum conyzoides	[86]
	Artemisia annua	
	Artemisia afra	
	Aspilia africana	
	Baccharoides adoensis

Decoction which is the act of boiling of plants, and/or plant parts, in water is the commonest way of making the medicine out of the plants available for drinking. Concoction, on the other hand, is the processing of medicinal plants into powder and/or ingestion of fresh extract from plants. For decoction, and infusion (steam bath), preparations depend on plant type, parts, and choice which is mainly related to geographical communities. Decoction goes with water measurement and is drank orally. For concoction, some plants are dried at room temperature, pulverized, and transformed to powder. When in need, 2–3 tablespoon is added to water and boiled to obtain a decoction. Boiling of plants or plant parts has no reference time limit but can be estimated with the initial volume of water reducing to half of its original volume. Some are prepared by squeezing fresh leaves of a chosen plant to obtain 2–3 teaspoon of a juice-like liquid daily. In some cases, different plant leaves can be used to make an infusion with fresh roots that are pulverized and taken orally. Some squeezed juice of medicinal plant can be mixed with cold or warm water for bathing while some are eaten as vegetable for preventive measures [92]. For lymphatic filariasis, desired plants or parts are grinded into powder to increase the surface area of the plant so that a chosen extractant can easily extract reasonable quantity of active ingredient in the plant. Decoction and infusion methods of preparation are mostly employed while orally drinking of the prepared medicine for malaria treatment while topical application of concoction on the affected limbs and bathing with decoction are common methods of treating lymphatic filariasis.

In Ethiopia, crushing, powdering, maceration, decoction, and others are the commonest means of formulating medicinal plants. The medicines are orally administered as a route of delivery into the body. Water and some ingredients (honey, butter, salt, coffee, tea, and milk) are added while making the preparation to reduce the bitter taste of the plants, hence spicing the medicine and reducing toxicity [85].

In Ghana, leaves are more frequently used, mainly for decoction, hence ranking 95.35%, and decoction for steam bath and rubbing or massaging plant tissue on the body constitute 2.3% each [87]. Decoction of medicinal plants constitute 70.5%, infusion 5.4%, oil treatment and steaming 1.3%, and roasting 0.3%. Plant materials may be chewed, pounded, ground, or crushed while dry materials are burnt, smoked, and inhaled. Extracting solvents include methanol, water, ether, ethanol, dichloromethane, chloroform, ethyl acetate, and petroleum ether [22].

In Nigeria, a popular concoction known as Agbo-Iba is being reported to protect mice against *Plasmodium yoelii nigeriensis.* The concoction is formulated with leaves of *Cajanus cajan* (pigeon pea), *Latifolia* sp., *Cymbopogon giganteus*, *Nauclea latifolia*, *Euphorbia lateriflora*, *Mangifera indica*, and barks of *Cassia alata* and *Uvaria chamae* [93]. The experimentation of the Agbo-Iba formulation is decocted for 3 h and administered to mice orally. The result showed protection of the mice against *P. yoelii nigeriensis*. However, a report has it that Agbo-Iba was more of prophylactic instead of therapeutic for malaria treatment [93]. Similarly, a multi-herbal combination mixture containing the leaves of *Carica papaya*, *Azadirachta indica*, *Cymbopogon citratus*, and *Anacardium occidentale* are used as a steam therapy against malaria. The steam from the concoction in a cooking pot is guided for a patient to inhale a hot steam from the pot by covering both the patient and the hot pot.

Administration dosages of medicinal decoctions and concoctions vary, and no stringent precision exist among traditional medicine practitioners for the same ailment but are very certain about their recipes. None conformity and compliance to dosage by traditional medicine practitioners and patients, respectively, may hamper the goal of malaria treatment with medicinal plants. For instance, some patients may stop taking a *Cissampelos mucronata* roots concoction half way because of its bitterness. This concoction is usually prescribed to be taken thrice a day for 7 days [21]. However, dosages and strength of the medicine are peculiarly age dependent. In some cases, the volume of consumption range is between 100 and 500 ml, 250, and 100 ml for adults, older children above 5 years, and children less than 5 years, respectively, or from 1 to 3 tablespoon in reverse order. The chosen quantity could be taken one to three times daily for 7 days or until full recovery is ascertained [94, 78, 92].

In discussing medicinal remedies of plants about malaria, for instance, the terms anti-malaria and anti-plasmodia are mentioned but does not mean the same thing. Anti-plasmodium is related to in vitro study of medicinal plants while anti-malaria is related to in vivo study of medicinal plants. For instance, anti-plasmodial action of plant extracts in in vitro study will be rated 'very good' when the IC_{50} is less than 5 μg/ml, good when IC_{50} is greater than 5 μg/ml but less than 10 μg/ml, and moderate when the IC_{50} is 10ug/ml or less than 20 μg/ml. For anti-malaria, action of plant extracts in in vivo study will be rated 'very good' when the extracts suppress about or more than 50% at 100 mg/kg of a body weight in a day. It will be good when the extracts suppress malaria by more than 50% at 250 mg/kg of a body weight in a day and moderate when more than 50% of malaria is suppressed at 500 mg/kg of a body weight in a day [95]. Basic febrile symptom indicators for malaria, which traditional medicine practitioners depict to commence treatment, include feeling of cold/goose pimples, headache, fever, sweating, loss of appetite, body weakness/feeling sleepy, dizziness, vomiting, and body pains. Medicinal plant-based preparations are orally drunk, steam inhaled, topically applied, and rubbing of essential oils on the skin [21, 22].

5 Challenges in the Use of Medicinal Plants in the Treatment of Mosquito-Borne Parasitic Diseases in the Tropics

The use of medicinal plants to treat different diseases especially infectious ones [96–116] and control of vectors of some parasitic diseases [117–121] has transcended from folkloric phase to a novel practice that involves heuristic exploration and taking cognizance of all the processes (formulations and dosages) to be documented for posterity and reproducibility. However, like every other sector of human endeavour, the use of medicinal plants especially the act of harvesting, formulations, standardized dosages, and others present some challenges in their use. For instance, harvesting whole plant and making use of root structures are not sustainable practices since many of the medicinal plants are sourced directly from the wild and hence, could lead to biodiversity loss. Seasonal variation, environmental geography, and methods of extraction of active compounds are challenging factors that can influence the concentration of phytochemical extracts which are essential in the treatment of mosquito-borne parasitic diseases [122].

The process of extracting active compounds from medicinal plants for further examination and characterization poses some difficulties for researchers. For example, poor aqueous solubility, and rapid breakdown of compounds such as berberine and emodin (characterized plant compounds for treatment of mosquito-borne diseases) have been a challenge in pharmaceutical development of such compounds into readily available medicine [123–125]. Others include having enough quantity of the extracts to justify production cost and having the compounds that can work in both in vitro and vivo because some compounds are active in vitro at a small quantity which could not be enough for isolation, hence limiting their use in in vivo studies. Again, some parasites lack animal models for their empirical evaluation. For instance, filarial parasite such as *Wuchereria bancrofti* cannot survive or be maintained in any known experimental animal for in vitro and vivo studies, thus no screening model to be used to evaluate the potency of medicinal plants on the parasite. In some cases where phytochemical compounds are active in in vivo study, it occurs at higher dosages which are therapeutically not meaningful.

In most cases, the toxicity of most of the plant compounds are not yet evaluated to determine their toxicity level, hence limiting the acceptance of their medicinal potentials. The data necessary for selective index of the compounds are not worked out or not readily available at the disposal of professionals, hence their cytotoxicity importance is still questionable. More still, there is paucity of clinical data about safety and efficacy occasioned by lack of requisite laboratories especially in the developing countries, hence making practitioners not to have a common ground for standard preparations and dosages and contraindications of plant-based medicines.

6 Strategies for the Overcoming the Hurdles in the Use of Herbal Medicine in the Treatment of Parasitic Diseases Transmitted by Mosquito in the Tropics

Motivational incentives are spices that drive the wheels of production; hence, herbal medicine practitioners should be encouraged and promoted by organs of governments and multinationals. They should also be enlightened on the sustainable means of conserving biodiversity while providing healthcare services. It is therefore, imperative to cooperate with herbal medicine practitioners when carrying out scientific researches on medicinal plants. Their inclusion in the researches will reduce wastages in using many acclaimed medicinal plants, hence restricting scientific evaluation on the selected plants that are efficacious against parasitic diseases. For a sincere cooperation and willingness, the herbal medicine practitioners who are likely to hoard medicinal information of different plants should be enticed with some level of patency of the outcome of the researches.

There should be need to have policies on the use of traditional or herbal medicines to regulate traditional medicine practitioners with a goal to having standards and fine-tune researches that are leaned to their traditional claims. The policies shall convey the objectives of propagation, protection, and sustainable use of medicinal plants in the treatment of various ailments in their communities. The health sector should be organized through ministry of health to champion a bill for collaboration between healthcare sectors and traditional medicine practitioners to have a national council of traditional medicine practitioners and other medical practitioners to act as a body that would protect herbal products of her members. The isolated or purified compounds that emanate from scientific evaluations should undergo further investigation to cut down the limitations in the quest to develop novel plant-based medicines that are sustainable, cheap, and affordable. For parasites without reliable animal models, new animal models ought to be sought for so as to understand the host/parasite interactions for effective testing of medicinal plants in both in vitro and vivo studies.

7 Conclusion

Diseases associated with mosquitoes are previously seen as a peculiar problem in the tropical countries, but today, they are accepted threat to the world public health because of mosquito species diversity and their geographical spread. Mosquitoes are spreading globally due to climate change, pattern of land use, and the continued increase in number of people moving from one country to the other, hence threatening almost half of the global population. Mosquito-borne parasitic diseases affect both people in the urban and rural villages but most prevalent in villages without adequate living conditions such as housing and sanitation and more disturbing to those with low immunity. Many female mosquito species are culprits in transmitting infectious parasitic diseases such as lymphatic filariasis and malaria between humans and/or from animals to humans.

The use of medicinal plants to treat and manage mosquito-borne parasitic diseases in the tropics mainly in Africa is linked to cultural acceptability, efficacy, accessibility, and affordability. Greater percentage of people living in the rural communities in the tropical countries treat almost every ailment with traditional medicines that originate from plants which are prescribed by traditional medicine practitioners or herbalists. Medicinal plants are cautiously selected plants which have been used in the tropics for years, for treatment and management of diseases from the ancient time till now. In traditional medicine, herbs and plant products are still being used among the African, Asian, and Latin American people, and their use is currently extending to Australia and the USA.

Information from traditional medicine practitioners show that the use of medicinal plants against diseases such as mosquito-borne diseases is economical, simple to use, easily accessible, and cheap while synthetic drugs require a lot of time, resources, and efforts from the onset. Medicinal plants are reported to have natural compounds in them which are anti: viruses, bacteria, protozoa, nematodes, fungi, oxidant, inflammatory, and carcinogenic. Their use in traditional medicine is beginning to attract consideration among the healthcare professionals in the international community because of its current documentation in print and other forms of media.

Tropical countries are biodiversity hotspot for medicinal plants which traditional medicine practitioners and/or herbalists have used to treat mosquito-borne parasitic diseases with reliable successes. However, biodiversity loss occasioned by continuously harvesting of whole plants and root structure, lack of support and motivation from appropriate quarters, adequate scientific production tools, and paucity of documented data on medicinal plants are among the challenges against the use of medicinal plants used in the treatment and management of mosquito-borne parasitic diseases. Defined policies for collaboration between the organized health sectors through the ministry of health to have a consolidated national council of traditional medicine practitioners and other medicine practitioners ought to act as a body to protect medicinal products, and council members shall form alliance for acceptance, patronage, and sustainability of use of medicinal plants for treatment of mosquito-borne parasitic diseases in the tropics.

Abstract

Arthritis is a global concern, affecting the global population, especially older people. The allopathic treatments proved their efficacy but toxicities too, so the need is to establish the treatment which should be productive and safe too. Many herbal-based medicines are used in the traditional medicine system, proving their effectiveness in the disease. The need of the hour is to establish their scientific, mechanical approach to arthritis treatment, which can improve the quality of life of these patients. In recent years, scientific research has shown that plant bioactive compounds are efficacious in disease treatment. This chapter aims to establish the knowledge of herbal medicines in disease treatment through the available scientific research data and their applicability. The plant-related drugs and disease knowledge are essential for treating disease. Ayurveda is the best and gold standard in terms of efficacy. Ancient literature like Ayurvedic Pharmacopeia and Chark Samhita have not only classified but also provided evidence-based knowledge on many diseases. In this chapter, we have conceptualized the various bioactive compounds from herbal drugs in their role in disease management treatment. The plant's primary and secondary metabolites have massive potential for treating arthritis. We have discussed the targeted sites for the disease management and applicability of herbal drugs in arthritis through available scientific-based evidence.

Keywords

Arthritis · Herbal medicines · Bioactive compounds · Mechanism of action

Abbreviations

AIA	Adjuvant induced arthritis
Akt	Ak strain transforming
CIA	Collagen-induced arthritis
ERK	Extracellular signal-regulated kinase
FLS	Fibroblast-like synovial cells
MAPK	Mitogen activated protein kinases
NSAIDs	Non-steroidal anti-inflammatory drugs
PI3K	Phosphatidylinositol 3-kinase
RA	Rheumatoid arthritis

1 Introduction

Arthritis is a most worrying problem across the globe. Arthritis has prehistoric existence in the world medical background. According to ancient literature, Charka Susruta explained the kind of arthritis in well-known standard books like Charka and Susruta Samhitas. The symptoms of the disease include pain obstruction and stiffness of joint, bone, and muscle pain, which sometimes leads to paralysis in some cases. The term for arthritis is rheumatism, a joint disorder that reflects the existing blend of humoral and biomedical control globally.

Herbal drugs are defined as drugs having active constituents from natural plant parts like leaves, roots, flowers, and fruits. Herbal drugs have been used for the treatment of a variety of diseases from ancient times, and it is not an embellishment in the direction of the utilization of herbal drugs in the condition. Herbal medicines are amalgamated through the therapeutic knowledge of a generation of working physicians on an ancient system of medicine for more than long years. These days, investigators showed their enormous curiosity in therapeutic compounds that are consequent from plant origin since these drugs have the least toxicities and are not very expensive compared to available treatments. Herbal drugs have significant action in many disease treatments. Many researchers have explained the applicability of herbal medicine and their active constituents in managing arthritis treatment.

In this chapter, we have conceptualized the applicability of bioactive compounds in the treatment lane. The disorders start with joints, ligaments, muscles, tendons, bones, and nerves. Available literature suggests that the conventional medicine system incorporates complete body components. According to Charka, the rainy season, its moist, cold storms, and polluted water supply produce disturbances in wind, the primary reason for rheumatic problems. Diet, age, heredity, and lifestyle are important factors in disease development. The primary symptom is pain, which leads further to inflammation.

Pain is the sensation that leads to so many problems in day-to-day life. Pain can be tolerated or not depending on the person when it affects aged people, especially older ones, creating discomfort in daily activities. The primary problem in the case of pain is it is not measurable. Clinicians use a scale known as VAS (visual analogue scale) to treat the patients, which works on the perception of the patients. The recent evidence of chronic toxicities with the available allopathic treatment provided a path toward new research.

1.1 Inflammation

Inflammation is a foremost problem in arthritis, distinguished by redness, heat, inflammation, and failure of function. Arthritis symptoms are stiffness, pain, inflammation, and loss of joint tasks. The diverse type of arthritis contains distinguishing indication, diagnosis, and disease management [1]. The types of arthritis are osteoarthritis and rheumatoid arthritis.

A chronic inflammation-related disease that mainly involves the periarticular tissue, cartilage leads to deformity, functional disabilities, and significant disability as a result of many inflammatory transmitters secreted through macrophages, such as eicosanoids like prostaglandins, cytokines, leukotrienes, and reactive oxygen species [2].

RA is the diverse process involved in synovial cell proliferation, fibrosis with cartilage degeneration, and bone attrition progression reconciled by an inter-reliant complex of cytokines, proteolytic enzymes, and prostanoids.

The cytokines, precisely tumor necrosis factor and interleukin-1, have prominent functions in disease. The increased level of IL-1 in the synovial fluid can be seen in disease patients; the concentrations of IL-1 in the plasma reported by researchers correlate with the disease functioning [3].

1.2 Rheumatoid Arthritis

The different forms of the disease are as follows:

Palindromic rheumatoid arthritis
Rheumatoid spondylitis
Juvenile rheumatoid arthritis

1.3 Other Kinds of Arthritis

- Osteoarthritis
- Primary osteoarthritis – Affects older age population
- Secondary osteoarthritis – Affects all ages of populations
- Ankylosing spondylitis
- Infectious arthritis
- Gout

1.4 Epidemiology

The occurrence of the disease is 0.3–1% across the globe, majorly in developed nations [4]. The disease prominently affects women more than men (3:1), and the progression of the disease is mainly seen in ages 30–55 years. It affects 0.5–1.0% of adults, and 0.75% of disease cases are reported approximately in India [5]. Arthritis is highest among adults due to lack of physical activity compared to those who are inadequately active or have biological activity. The prevalence of disease may be due to concomitant diseases like cardiovascular, obesity, and diabetes. It is expected that the number of cases of the disease may increase with the highest percentage in adults due to current food habits and other factors.

1.5 Disease Etiology

The disease etiology is not known. Genetic propensity to environmental factors is probably responsible for the disease progression.

1. **Environmental factors**: The disease has been linked to mineral oils, silica exposure, diet factors, and blood transfusion.
2. **Role of sex hormones**: According to the prevalence of disease, it has been seen that disease prominently occurs in women. In female, it is observed that it generally starts at the perimenopausal, perinatal, and gestation period.
3. **Genetic**: The genetic mechanism of this disease is not precise; the genetic level's appearance compared to healthy patients strongly suggests that genetic inheritance is the factor that resembles the key for future-based discoveries for diagnosis and treatment. Some kinds of literature reported that persons with selective human leukocyte antigen genes have a greater risk for disease prevalence than those in which human leukocyte is not available.

1.6 Pathophysiology

The pathophysiology can be understood through Fig. 1. According to the disease pathophysiology of rheumatoid arthritis, it starts from the synovium. The level of cytokines plays a role in disease progression through cartilage destruction. The destruction of collagen leads to the narrowing of joint space and the destruction of the bone. The pannus formation occurs due to the exudation of fluid in the synovium. Activation of CD4 T cells releases the cytokines that cause the formation of fibroblasts by MMP and RANK ligand, leading to the activation of osteoclast and destroying the tissues, promoting the destruction of joints.

There are two chief mechanisms for the inflammation process: B cells and T cells activation by the immune system, which have significant functions linked with the disease. T cells are essential in distinguishing the antigen as "non-self," which produces cytokines. After that, the part B cells start to secrete and reproduce the

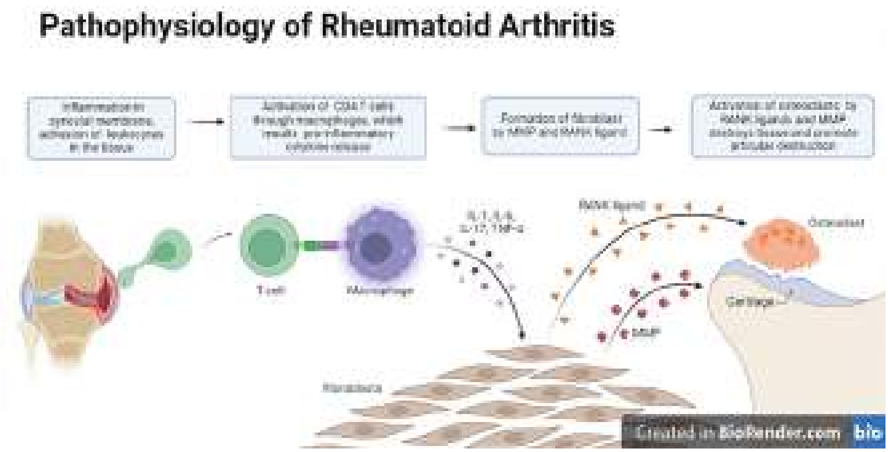

Fig. 1 Pathophysiology of rheumatoid arthritis

antibodies into the systemic circulation to identify antigens and activate the inflammation. Then, the various signaling pathways' role comes, which releases further pro-inflammatory mediators and causes the progression of the disease.

1.7 Responsibility of NF-κB/IκB-α in Inflammation Associated with RA

The disease pathophysiology entails the continual appearance of pro-inflammatory cytokines, chemokines that contain various sites like the presence of transcription factor inside their promoter, signifying the NF-κB involvement in the progression of the disease. The activation of tumor necrosis factor-alpha triggers NF-kB, which results in an increased level in the joints of rheumatoid arthritis patients. Furthermore, hyper (NF-κB) activity can also be seen in the macrophages of RA patients.

Classical and alternative pathways are the two essential signaling pathways that play a role in stimulating NF-kB. In these pathways, one common thing is IkB kinase complex activation that has the catalytic kinase subunits with a regulatory non-enzymatic protein named IKK. These NF-kB dimers are activated due to IKK-mediated phosphorylation-induced protein degradation of the IκB-α inhibitor, which liberates the active NF-κB transcription factor subunits to translocate to the nucleus and induce target gene expression. Without activating the signal, IkB sequesters NF-kB subunits and inhibits its translocation, consequently terminating transcriptional activity. In the classical signaling pathways, ligand binding happens on cell surface receptors such as a member of the Toll-like receptor superfamily, leading to the recruitment of adaptors to the receptor's cytoplasmic domain. In turn, these adaptors recruit the IKK complex, leading to phosphorylation and IB inhibitor degradation.

1.8 Role of Immunostimulants or Immunomodulators

The immune system assists in homeostasis through the active network that engages the applicability of numerous molecular basis cells capable of differentiation and reorganizing foreign particles from the self-cells. There are two types of immunity: innate and adaptive. Innate immunity works as the primary defense involving roles of cellular and molecular mechanisms that instantly respond to infection when any antigen attacks [6]. The natural immune system contains physical, chemical, and other cellular barriers. The group of cells like macrophages, neutrophils, and many more having foreign cells from self-act as cellular barriers [7]. If any pathogen or foreign cell can escape the first line of defense, immune system cells become the second line of defense or adaptive immunity [8].

1.9 NSAIDs: Other Inhibitors of Pro-inflammatory Mediators

The non-steroidal anti-inflammatory drugs treatment has been used for a long time to assuage arthritic pain and inflammation. Aspirin and Ibuprofen are drugs used extensively by clinicians to treat disease. Many NSAID products have become available for treating illness, but their toxicities are also high and concern global people. In the past, many painkillers were withdrawn from the pharmaceutical market, like rofecoxib and valdecoxib, due to cardiac toxicities. So, the safety of patients is a prime concern with efficacy.

2 Herbal Drugs and Applicability of Their Bioactive Compounds in the Treatment of Arthritis

Ayurveda has proven its efficacy in the disease since old times. Ayurveda originated from the Sanskrit words ayus and veda, which means denotation of life and knowledge. Ayurveda is a discipline of life focused on man and cures for diseases through the comprehension of medicinal plants [9]. The primary metabolites include that material that strengthens plant organization, in addition to the energy metabolism of the plant, e.g., proteins, carbohydrates, and fats as primary bioactive compounds. Secondary metabolites are the chemicals not utilized by plants for their organization or purpose. They are moderately available in small quantities with diverse application to protect plants from various microbes and insects, which also exhibits growth-regulating action in the plants. The scientific-based evidence proved the therapeutic applicability of these phytochemicals in disease management. Herbal plants used for the treatment of arthritis are summarized in Table 1. The review of available data suggests that herbal plants with bioactive compounds like flavonoids, triterpenoids, and phenolic compounds can be used in the treatment of arthritis. We have performed studies related to the plant-based drug for arthritis and found that researchers reported their work through the use of various animal models for

Table 1 Bioactive compounds of plant-based medicines for arthritis

S. no	Botanical name of plant	Family	Plant bioactive compounds	Reference
1.	*Abrus precatorius*	Fabaceae	Triterpenoid	[10, 11]
2.	*Acacia confusa*	Leguminosae	Flavonoids, melanoxetin	[12, 13]
3.	*Acacia hydaspica*	Leguminosae	Gallic acid, caffeic acid, rutin, catechin	[14, 15]
4.	*Aconitum vilmorinianum*	Ranunculacae	Diterpinoids, vilimorine A-D	[16, 17]
5.	*Albizia procera*	Fabaceae	Biochanin-A	[18, 19]
6.	*Allium sativum*	Liliaceae	Diallyl disulfide	[20, 21]
7.	*Alstonia boonei*	Apocynaceae	Phenolic acids, rutin, isoquercetin, flavonoliganes	[22, 23]
8.	*Alternanthera bettzickiana*	Amaranthaceae	Gallic acid, catechin	[24, 25]
9.	*Asystasia dalzelliana*	*Acanthaceae*	Steroids, flavonoids, alkaloids, tannins	[26]
10.	*Azadirachta indica*	Meliaceae	Nimbolide	[27, 28]
11.	*Berberis orthobotrys*	Berberidaceae	Flavonoids, phenolic compounds	[29]
12.	*Cissus quadrangularis*	Vitaceae	Russelioside B	[30, 31]
13.	*Capparis spinosa* L.	*Capparidaceae*	Flazin, guanosine, capparine	[32, 33]
14.	*Caesalpinia sappan*	Caesalpiniaceae	Sappanol, episappanol	[34, 35]
15.	*Calophyllum inophyllum*	Calophyllaceae	Triterpenoids	[36, 37]
16.	*Calotropis gigantea*	Apocynaceae	Lupeol	[38, 39]
17.	*Caltha palustris*	Ranunculaceae	Polysaccharide B	[40, 41]
18.	*Cayaponia tayuya*	Cucurbitaceae	Dihydrocucurbitacin B	[42, 43]
19.	*Celastrus*	Celastraceae	Celastrol	[44, 45]
20.	*Capparis erythrocarpos*	*Capparaceae*	Proteins, polyphenols	[46, 47]
21.	*Curcuma longa* L.	Zingiberaceae	Curcuminoids	[48, 49]
22.	*Chloranthus serratus*	Chloranthaceae	Terpenoids	[50, 51]
23.	*Clematis orientalis*	Ranunculaceae	Flavonoids and glycosides	[52, 53]
24.	*Clerodendrum serratum*	Verbenaceae	Terpenoids, steroids, flavonoids, and phenolics	[54, 55]
25.	*Cuscuta reflexa*	Convolvulaceae	Beta-sitosterol	[56, 57]
26.	*Drynaria quercifolia*	Polypodiaceae	Squalene, gamma tocopherol, N-hexadecanoic acid	[58, 59]
27.	*Eriobotrya japonica*	Rosaceae	Corosolic acid, oleanolic acid, and ursolic acid	[60, 61]
28.	*Ephedra gerardiana*	Ephedraceae	Alkaloids, flavonoids	[62, 63]
29.	*Euphorbia neriifolia*	Euphorbiaceae	Steroid and terpenoid	[64, 65]
30.	*Ficus bengalensis*	*Moraceae*	Flavonoids, terpenoid, sterols	[66, 67]
31.	*Fagopyrum cymosum*	Polygonaceae	Eugenol	[68, 69]
32.	*Ginkgo biloba*	Ginkgoaceae	Terpene	[70, 71]
33.	*Glycosmis pentaphylla*	*Rutaceae*	Sulfur-containing amides	[72, 73]

(continued)

Table 1 (continued)

S. no	Botanical name of plant	Family	Plant bioactive compounds	Reference
34.	*Glycyrrhiza glabra*	*Leguminosae*	Licochalcone A (flavonoid)	[74, 75]
35.	*Hemidesmus indicus*	Apocynaceae	Triterpenoids	[76, 77]
36.	*Ipomoea batatas*	Convolvulaceae	Polyphenols, 3-epifriedelinol	[78, 79]
37.	*Jatropha isabellei*	Euphorbiaceae	Alkaloid	[80, 81]
38.	*Justicia gendarussa Burm F*	*Acanthaceae*	Sterols, flavonoids	[82, 83]
39.	*Kadsura heteroclita*	Schisandraceae	Lignans and triterpenoids	[84, 85]
40.	*Lantana camara*	Verbenaceae	Triterpenoids	[86, 87]
41.	*Laportea bulbifera*	Urticaceae	Neochlorogenic acid, cryptochlorogenic acid, and chlorogenic acid	[88, 89]
42.	*Lawsonia innermis*	*Lythraceae*	Lawsochylin A and lawsonaphthoate, luteolin, apigenin	[90, 91]
43	*Leucas aspera*	*Lamiaceae*	Epicatechin, beta epicatechin, procyanidin, beta-sitosterol	[92, 93]
44.	*Linum usitatissimum*	Linaceae	Alpha linolenic acid	[94, 95]
45.	*Litsea cubeba*	Lauraceae	Litsecols	[96, 97]
46.	*Lonicerae japonica*	Caprifoliaceae	Lonicerin	[98, 99]
47.	*Melastoma malabathricum*	Melastomataceae	*B*-Sitosterol, melastomic acid	[100, 101]
48.	*Monotheca buxifolia*	Sapotaceae	Flavonoids, triterpenoids, vitamin E, phytol,	[102, 103]
49.	*Moringa rivae*	Moringaceae	Fatty acids, vitamin E	[104]
50.	*Olea europaea*	Oleaceae	Oleuropein, ligstroside	[105–107]
51.	*Panax ginseng*	Araliaceae	Ginsenosides Rg3, Rk1, and Rg5	[108, 109]
52.	*Phyllanthus amarus*	Phyllanthaceae	Phyllanthin and hypophyllanthin	[110, 111]
53.	*Pinus maritime*	Pinaceae	Flavangenol	[112, 113]
54.	*Piper betle*	Piperaceae	Hydroxychavicol	[114, 115]
55.	*Pistia stratiotes*	Araceae	Triterpenes, flavonoids	[116, 117]
56.	*Premna serratifolia*	Lamiaceae	Phenolic compounds and flavonoids	[118, 119]
57.	*Punica granatum*	Punicaceae	Tannins and anthocyanins	[120, 121]
58.	*Rhus verniciflua*	Anacardiaceae	Flavonol, fisetin	[122, 123]
59.	*Ribes alpestre*	Grossulariaceae	Phenolic and flavonoid	[124]
60.	*Ribes orientale*	Grossulariaceae	Polyphenolic compounds, flavonoid	[125]
61.	*Ruta graveolens*	Rutaceae	Alkaloids, polyphenols	[126, 127]
62.	*Salacia reticulata*	Celastraceae	Polyphenols,	[128, 129]
63.	*Salix nigra*	Salicaceae	Sterols, terpenes, flavonoids	[130, 131]

(continued)

77.	*Tragia involucrata*	*Euphorbiaceae*	Rutin, quercetin	[160, 161]
78.	*Trewia polycarpa*	*Euphorbiaceae*	Terpenoids, flavonoids	[162, 163]
79.	*Tridax procumbens*	Asteraceae	Flavonoids	[164, 165]
80.	*Trigonella foenum graecum*	Fabaceae	Steroids, alkaloids, polyphenols, flavonoids	[166, 167]
81.	*Urtica pilulifera*	Urticaceae	Phenolic compounds	[168, 169]
82.	*Vernonia cinerea*	Asteraceae	Steroids, flavonoids	[170, 171]
83.	*Vitex negundo*	Verbenaceae	Phenylnaphthalene-type lignans	[172, 173]
84.	*Wendlandia heynei*	Rubiaceae	Terpenoids, B-carotene	[174, 175]
85.	*Withania somnifera*	Solanaceae	Phenolic compounds, withanolides	[176–178]
86.	*Xanthium strumarium*	Asteraceae	Sesquiterpenoids, phenylpropenoids, lignanoids	[179, 180]
87.	*Yucca schidigera*	Asparagaceae	Resveratrol, spirostanol	[181, 182]

arthritis, which gives a direction in the treatment of disease and also attracts the phytoconstituents' role.

3 Bioactive Compounds and Their Targets in Disease

Bioactive compounds are the secondary metabolites isolated from herbal medicinal plants, animals, fungus, and microorganisms. Moreover, they are having pharmacological or toxicological effects on organisms, foremost to utilization in food and pharmaceutical industries. In the drug discovery process, the new property of these compounds gave the direction in the treatment of disease.

Treatment of any disease requires the knowledge of the targets for the drug delivery. Bioactive compounds of plant-based medicines have played a vital role in diseases, so the need of the hour is to explore these compounds with the moa that can give direction in disease management. As per the disease, etiology immune system plays a vital role, so targeting the cytokines in arthritis can give us the direction for treatment. In this section, we have highlighted that the various pathways like PI3K and Akt signaling, MAPK signaling, NF-κB, STAT signaling, and NRF2 signaling responsible for disease progression with the applicability of primary and secondary metabolites from herbal drugs in the lane of treatment reported by researchers.

3.1 Flavonoids

Flavonoids are successive compounds, and the structure of these compounds suggests that they are made up of phenyl rings and phenolic hydroxyl groups throughout their carbon chains [183]. Flavonoids have significant efficacy in treating arthritis and have been reported by many researchers that can be correlated with Table 1. Flavonoids also significantly influence therapy through inhibition of PI3K and Akt signaling pathways. This pathway plays a vital role in disease progression through fibroblast-like synovial cells that may secret an abundance of cytokines that incessantly excite FLS cells by unrestrained propagation of cells. PI3K and Akt signaling path is believed to be a connection between the propagation and programmed cell death of FLS cells. The studies on arthritis suggest that these signaling are highly articulated and reflect the consequence of the extreme movement of fibroblast-like synovial cells. Many pro-inflammatory mediators like IL-17 and IL-21 can support the inflammatory propagation of fibroblast-like synovial cells by stimulating and activating PI3K [184].

Some researchers reported that LY294002, a PI3K inhibitor, can improve over-growth and inflammation in synovial joints in animal studies [185].

Another critical action of flavonoids is the inhibition of the MAPK signaling pathway, which is also responsible for disease progression through stimulation of various kinase systems like ERK, p38, c-Jun N-terminal kinase, and ERK5, which control many enzymes cytokines and chemokines causes persistent inflammation and abnormal hyperplasia [186].

Some researchers revealed that a flavonoid isolated from *Glycyrrhiza uralensis* can considerably block the IL-1β-induced rheumatoid arthritis fibroblast-like synovial cell propagation by slow-down through the kinase system [187].

Flavonoids also inhibit the NF-κB STAT signaling pathways in disease. The NF-κB and STAT lead to shifting in the nucleus that causes inflammation, cell propagation, and apoptosis. Some studies suggested that flavonoid Genkwanin extracted from *Daphne genkwa* showed anti-arthritic activity by slowing down the p-NF-κB p-STAT3 in AIA mice [188].

Several researchers reported through their research on NRF2 signaling that it plays an essential role in arthritis through oxidative stress concerned with etiological and diagnostic parameters. The activation of the Nrf2 signaling leads a range of enzymes like heme oxygenase-1 HO-1 to be released, having antioxidant properties that regulate the oxidative stress condition in disease [189]. Some studies implicated that epigallocatechin 3-gallate has anti-arthritic potential up-regulation of Nrf2 and HO-1 in joints of CIA rats [190].

Moreover, a flavonoid calycosin isolated from the *Astragali radix* can inhibit the pro-inflammatory mediators in RA-FLS by up-regulation of Nrf2 and HO1, as reported by some researchers [191].

3.2 Lignans

Some researchers reported that lignans with antioxidant potential can inhibit the ROS through the NF-κB path, eventually decreasing the appearance of inflammatory cytokines and pro-inflammatory enzymes. Activating the AMPK and Nrf2 path increases antioxidant-related genes and promotes the release of anti-inflammatory cytokines [192].

3.3 Anthraquinone

The reported work by authors suggests that rhein is an anthraquinone, which demonstrated cell viability and differentiation without toxicities at humans' physiological levels but considerably decreased cytokine levels in urate crystal-activated macrophages [193].

3.4 ß-Sitosterol

ß-sitosterol structure is similar to the cholesterol group. The research work reported by authors revealed that ß-sitosterol showed marked inhibition on synovial angiogenesis through suppression and proliferation of endothelial cells that result in alleviated joint inflammation and bone erosion in CIA mice [194].

3.5 Terpenoids

Terpenes are an important class of organic compounds produced mainly by herbal plants. The researchers reported that terpenes moderate the immunologic response and cartilage destruction by inhibiting various cytokines responsible for disease progression [195].

4 Challenges with Herbal-Based Medicines

The major challenge with herbal-based medicine is standardization and quality control. Globally, various guidelines have been approved for standard, quality-related parameters of herbal drugs. WHO approved the guidelines for taking care of the standardization parameters of herbal medicines [196, 197]. This process involves the phytochemical investigation of raw material of plant-based treatment related to features like collection and management of plant material, therapeutic and safety profile measurement of the processed products with proper documentation based on knowledge, and proviso of produce products to consumers [198]. Growth and accomplishment of the guidelines of traditional or herbal drugs within diverse divisions of the globe are frequently tackled by quite a few confrontations [199, 200]. The problems often encountered in many countries are those connected to regulatory standings, evaluation of effectiveness with safety, and insufficient information concerning traditional and plant-related drugs in nationwide drug regulations. Many herbal medicines have inadequate information on their mechanism of action in disease treatment, and the adverse drug reactions are not known anymore. The interaction with other drugs data is not available.

The various parameters related to standardization and quality control are as follows.

4.1 Collection and Authentication

People use many herbal drugs on their traditional knowledge, causing problems in the collection, adversely affecting the yield and quality of chemical constituents, and errors in experiments. Authentication is the basic process before the experimentation of any herbal drugs.

4.2 Presence of Other Organic Materials

It's essential to collect, identify, and remove the other foreign organic materials during the collection because they can lead to errors in the experimental process and the purity of drugs too.

4.3 Ash Values Determination

Ash values are an essential method for the purity of crude drugs. The specific test is performed for the identification of the total ash value. These values also have significance with quality principles. The ash value also gives an idea of finding the suitable part for the extraction process.

4.4 Moisture in Plant-Related Drugs

The moisture content determination helps reduce the mistake in the judgment of the actual weight of drug material, i.e., little moisture recommends improved stability adjacent to product deprivation.

4.5 Extractive Yield

These are the investigative weights of the extractive yield of bioactive compounds of herbal drugs in different solvents. These give the knowledge of the relation between the solvent and plant metabolites, which can be utilized for isolation and impact the cost of herbal medicine.

4.6 Qualitative Profile Evaluation

Identifying and categorizing crude drugs with reverence to phytochemicals is essential in photo-constituent processing. It provides work for diverse investigative methods to recognize and separate the active ingredient. Bioactive compounds showing plans provide botanical characteristics, solvent selection, purification, and categorization of the active constituents, which are essential parameters for pharmaceutical utilization.

4.7 Chromatography

The detection of raw drugs is based on using major chemical constituents as markers. Chromatographic methods also play an essential role in identifying active plant-based constituents, which helps describe the relation with treatment. The process should be accurate and standardized.

4.8 Quantitative Evaluation of Chemicals

The plant phytoconstituents are one of the critical parameters for evaluating its efficacy in disease management and the applicability of major constituents, such as in dosage determination parameters.

4.9 Toxicological Screening

The toxicological screening is essential for determining toxic residues present in the preparation, which can lead to toxicities. Hence, it is essential to perform these studies per the available guidelines of the OECD. The processes are based on international guidelines based on scientific evidence.

Standardization is one of the critical parameters and needs for herbal drugs. Much literature is available on the uses of herbal medicines, but the problem is to prove the same through standardization parameters. Some issues may arise if someone is unaware of these drugs' therapeutic dosage. More work is to be needed in the standardization part of this medication.

Apart from these, additional factors affect the standardization and quality control of herbal drug's efficacy parameters for processing herbal medications.

4.10 Adulteration in Drugs

Adulteration affects efficacy as well as causes toxicities all over the world. There is a need to develop regulatory guidelines for adulteration of herbal drugs since quality testing is an important parameter.

4.11 Faulty Preparations

The irrational combination of drugs is a leading cause of drug-to-drug interaction. There is a need for strict guidelines for herbal preparations since the herbal market is increasing in terms of volume and consumption day-by-day. Faulty herbal preparation leads to adverse effects and reduced efficacy.

4.12 Storage

The ancient and current literature implicated the storage conditions of herbal drugs. Some factors like temperature, light, moisture, and air are essential parameters for primary and secondary metabolites as they directly affect the metabolites.

4.13 Dosage and Time

Many countries still use their traditional medicine system to treat various diseases. The Indian people use many herbal medicines and speak about dosage and time through their traditional knowledge. The ancient standard literature also implicates the therapeutic applicability of the same, so it is necessary to relate the traditional knowledge and scientific evidence to overcome the toxicities.

5 Prospects of Herbal Medicines in the Disease

The challenge for herbal medicine in arthritis management is the applicability of these formulations in disease management. In recent years, the surge in curiosity concerning the endurance of Ayurvedic formulations increased. From a comprehensive point of view, there is a transfer toward plant-based medicine, as the threats and the inadequacy of contemporary medicine have ongoing getting more perceptible, and the preponderance of Ayurvedic drugs are processed from herbal sources. In many countries, many herbal formulations are available for arthritis treatment, and people use these medicines without any prescriptions. Many small towns have some orthodox people who do not have proper qualifications and knowledge about these drugs but are selling them drugs. The need is to provide the treatment with the support of healthcare professionals, which is essential to create awareness among them for prescribing herbal medicine. It is the liability of the countries' regulators to ensure that the consumers get good quality medicine that is pure, effective, and safe for treatment. The regulatory setups are required for the clinical trials related to herbal drugs. The repositories should be available online for patient compliance, which can give a clear-cut idea for reporting adverse drug reactions with herbal medicines. The quality standards of raw materials related to plant sources of herbal medicines are a supreme consequence in mitigating their satisfactoriness in the current structure of the medical system. Most of the time, problems encountered by herbal drug manufacturers are the non-availability of raw materials for the quality control profile of herbal material and their formulations. Herbal product usage is increasing due to noise made by manufacturing companies through advertisements. Systems like Ayurveda still require awareness among the people and experiential support from contemporary medical sciences to make them plausible and tolerable for all [201]. The inventive investigation endeavors to describe the benefit of conventional systems of medicine with reverence to their safety profiles, which will possibly affect improved exploitation of these systems of medicine. Globally, several pharmacopoeias have offered herbal drug information through monographs describing the constraints and standards of many herbal medicines and several products completed by these standards, which are safe and productive. The value of herbal medicines in treating disease is increasing due to less toxicity when compared with allopathic medication. The herbal drugs market is expanding in terms of the volume of people who use these drugs as per their traditional knowledge. The acceptance of these drugs is increasing due to their safety margins. Many Pharma organizations have started manufacturing facilities for herbal medicines globally. Technological advancement is needed as primary and secondary metabolites of the drug have a prominent role in disease management. Herbal medicines can be a good choice compared to available drug treatments and can improve the daily life of these patients. As arthritis disease mainly affects older patients and has some concomitant treatment that increases chances of drug-to-drug interaction, Herbal medicines can be a good option for disease management as their safety margin is satisfactory. Many herbal formulations are available in the market for the treatment of arthritis and for improving the quality of life of these patients. Ethno-pharmacological studies are increasing regularly. The need is to relate traditional medicine knowledge with scientific evidence for appropriate formulations for patients' safety. Primary and secondary metabolites can be utilized for the future-based treatment of arthritis, as these metabolites can reduce the dosage due to their efficacy at minimum concentration. The time is to establish the ethanol-pharmacology concept on a broader base for the herbal medicines and changes needed in available manufacturing processes. The time is to show the ethanol-pharmacology idea on a wider base for the herbal medicines and modifications needed in available manufacturing processes. Labeling and product information for patients is also required to change from time to time for the acceptance purpose in disease treatment.

Almost three-fourths of the herbal medicines used wide-reaching were expected to be exposed after local treatment. As per the available data from WHO, the minimum percentage of contemporary drugs come from herbal sources used traditionally [202]. In the present scenario, almost all countries focus on the herbal medicine market due to its safety and efficacy. The growing demand for herbal medicine requires attention in terms of quality and methods for improving product processing and thought processes to get the maximum active bioactive compounds from the plant's raw material. The cost of processing bioactive compounds is high, and the need to develop methods like solvent selection is required. Many studies also focused on how that combination of water and alcohol can achieve better extractive yield. The modernization in processing methods not only affects the work but will also reduce the cost of medicine for the patients. All countries should focus on their native herbal drugs and explore their applicability in disease management. Every country should have an awareness program for their citizens to establish knowledge of herbal medicine. The various programs should be the plan for arthritis management for the stakeholders of the disease management. The time is to find the drugs that have not been explored well yet; many plants are not identified and stored in a database worldwide. Aquatic plants are another excellent option for treating arthritis in the future drug discovery process. The arthritic patients need to develop a formulation that can relieve pain and should have anti-inflammatory action. Patient tolerability to dosage is also a significant concern because many patients have some concomitant treatment.

6 Conclusion

Arthritis is increasing consistently, so it requires attention in diagnosing and treating the disease. The available allopathic treatment toxicities cannot be ignored. The need is to establish a treatment that is safe and effective. In this chapter, we have explained the mechanistic approaches of plant-related drugs with scientific evidence that can be utilized for future drug discovery processes. Herbal medicine can be an appropriate drug candidate for the management of arthritis. Perhaps more studies are needed to explore their potential. As per the etiology of the disease, cytokines play a crucial role in disease progression. We have highlighted the plant-based bioactive compounds such as flavonoids, lignans, anthraquinone, ß-sitosterol, and terpenoids that can be an option in future drug discovery as it has therapeutic values in the disease. The need of the hour is more research focusing on metabolites for getting a drug candidate and molecular basis for drug targeting.

The worldwide recognition and utilization of herbal medicines plus associated products continue to presume and increase. The problems involving adverse drug reactions at the current time are too much more dramatic, increasing in occurrence and no longer controversial since the previous delusions of concerning or else classifying herbal medicinal products as safer as they are extracted from natural origin. The truth is that saying safer and origin from nature are not the same; therefore, regulatory guidelines for herbal medicines must standardize with fortified approaches on the international level. The applicable regulatory requirements in diverse nations of the globe necessitate being proactive and enduring in the direction of suitable actions toward looking after public health by ensuring that every single herbal medicine permitted for sale is safe and of appropriate quality. Quality education specifically related to herbal medicine is needed for a better understanding. Globally, the guidelines should meet equal parameters. Through this, quality herbal medicine will be available for the patients. The pharmacist should give all the information related to drugs, like drug-to-drug interactions, for the betterment of the disease patients.

The contributors of plant-based drugs, like doctors, nurses, and pharmacists, have minute training in understanding the effects of herbal medicines on the health of their patients. Several are inadequately informed about these products, and how to use them is a big question. Sufficient training and teaching are required because patients use different types of prescription and counter-product drugs. The fact is that healthcare professionals have to play a vital role in expressions of their precious assistance to safety assessments of medications with the significance of the same. All contributors to herbal medicines should be adequately allowed to observe the safety of herbal medicines. It can be achieved through partnerships with conventional healthcare professionals. The need of the hour is to create such an environment for smooth functioning and adequate knowledge about the use and safety of herbal medicines. The qualification of every doctor, nurse, pharmacist, and patient linked to herbal drugs is essential for treating and understanding the misuse of herbal medicines. To improve the quality of life of arthritis patients, it is required to develop the formulation based on natural sources.

Abstract

Worldwide, chronic obstructive pulmonary disease, asthma, lung cancer, and cystic fibrosis are some of the top causes of death and morbidity. As a result, these illnesses place a significant burden on healthcare systems, economies, and societies in many nations. Chronic respiratory illnesses impact the respiratory airways, lung parenchyma, and pulmonary vasculature, among other parts of the respiratory system. Respiratory disorders are a fairly frequent diagnosis in children, adolescents, and adults in the era of air pollution. Both upper and lower respiratory system disorders can have a significant negative impact on overall health as well as economic and psychological burdens. Because they are eco-friendly and have few side effects, plant-based solutions are receiving a lot of attention as a means of treating and preventing health issues. It is believed that active plant contact and exposure to nature are good for both physical and mental health. The immunological and cardiovascular systems are the main targets of plant-based medications. The medicinal properties of both terrestrial and marine botanicals are an effective control of a variety of disorders. Biologically active compounds with distinct values may be isolated from both. Therefore, the main aim of this chapter is to know the potential of pulmonary diseases and to provide the knowledge of plant therapy or some medicinal herbs for curing.

Keywords

Chronic pulmonary disease · Lung disease · Respiration · Immune · Psychological · Airborne · Botanicals · Medicinal herbs · Anti-inflammation

Abbreviations

AYUSH	Ayurveda, Yoga and Naturopathy, Unani, Siddha, and Homeopathy
ACE2	*Angiotensin-converting enzyme*
AKT	Ak strain transforming
BAX	Bcl-2-associated X protein
CD	*Cluster of differentiation*

CDK	Cyclin-dependent kinases
COPD	Chronic obstructive pulmonary disease
COVID-19	*Corona virus disease – 2019*
CXCR4	C-X-C motif chemokine receptor 4
DMDS	Dimethyl disulphide
ET	Endotracheal Tube
FEV	Forced expiratory volume
GSH	Glutathione
HIV	Human immunodeficiency virus
HUVEC	*Human umbilical vein endothelial cells*
LOX	Lipoxygenase
MCT	Medium chain triglycerides
MDA	*Malondialdehyde*
NOS	Nitric oxide synthase
PAP	Pulmonary artery pressure
PASMC	*Pulmonary artery smooth muscle cells*
PDE	Phosphodiesterase enzyme
RNA	Ribonucleic acid
ROS	Reactive oxygen species
RVH	Right ventricular hypertrophy
RVSP	*Right Ventricular Systolic Pressure*
SARS CoV-2	Severe acute respiratory syndrome coronavirus 2
SOD	Superoxide dismutases
TGF	Transforming growth factor
TMS	Transcranial magnetic stimulation
VEGF	*Vascular endothelial growth factor*
WBC	White blood cells

1 Introduction

Medicinal herbs plays a critical role in the well-being of rural, remote, and indigenous people. Plants with medicinal properties are used to cure a wide range of illnesses in both humans and animals. Scientists are interested in the ethnomedical and nutritional uses of locally sourced plant products, prompting a search for bioactive chemicals. Carbohydrates, protein, and fat are all found in medicinal plants. Physiological, metabolic, and morphological processes rely on these substances, making them essential for human survival [1]. Medicines, dietary supplements, and other healthcare items often contain ingredients originating from plants. Antioxidants, hypoglycaemics, and hypolipidaemics are just a few examples of the types of phytochemicals found in plants that play a significant role in the search for new and improved therapeutic components. Many pharmaceuticals have their origins in plants, either as direct or indirect sources [2]. Humans rely on plants for a wide variety of things, including food, shelter, fibre, and medicine. Herbal remedies are the primary choice for health care among rural residents. Even in places where conventional medicine is readily available, there has been a recent uptick in curiosity about herbal remedies. Minerals and plant-based chemicals found in medicinal plants are two examples of the types of physiologically active components that have been shown to have an array of impacts on human physiology [2]. As they are an abundant source of several bioactive chemicals, essential oils are becoming more and more popular. They are preferred over chemical antioxidants due to their antioxidant and antibacterial capabilities as well as their GRAS (generally recognised as safe) status [3].

Botanicals are used as ingredients in medications, cosmetics, dietary supplements, and herbal teas, among other healthful products, and have seen a surge in popularity in recent years [3]. Plants used for medical purposes have been found to have bioactive substances that may reduce the risk of developing serious illnesses like cancer, cardiovascular disease, and diabetes. Medicinal herbs are essential in the treatment of oral health problems such halitosis, gums bleeding, dental caries, ulcers of mouth, and gingivitis due to their high effectiveness and low risk of adverse effects. Many plant species have unique mechanisms for producing secondary metabolites [3]. A lack of certain vitamins and minerals in the diet has been linked to a variety of potentially serious health problems, including malnutrition and a host of diseases caused by micronutrient deficiencies. Historically, all medicines were derived from plants, either in the form of a crude extract mixture or a simpler sample of plant parts. The primary advantage of using plant-based drugs is that they are non-toxic, far safer than their synthetic counterparts, while also providing significant therapeutic benefits and being much cheaper.

The last several decades have seen a surge of curiosity about medicinal plants and their traditional applications across the Indian subcontinent. Many young people nowadays are leaving rural communities to pursue higher education and work in urban centres, and with them, there has been a decline in the value placed on traditional medicines. The rich medicinal plant knowledge of the country is in danger due to the present trends of deforestation, environmental degradation, and modernization in the area. Hence, herbal knowledge is only accessible by the elderly, and only a select few have access to conventional therapies. Hence, by recording indigenous people's traditional plant medicine, we can close the generational gap in herbal knowledge. So, the goal of this chapter is to examine the big picture of the various herbal plants, formulations, and plant constituents that are currently being utilized to treat respiratory ailments.

2 Phytoconstituents Contributed in Pulmonary Disease Treatment

Plants contain molecules called phytochemicals, which have protective and disease-fighting qualities. Phytochemical components such as triterpenoids, quercetin, resveratrol, etc., have shown significant clinical efficacy against cardiovascular and respiratory problems [4]. In Table 1, we have outlined just a handful of the plant-based chemicals that are effective in treating respiratory disorders.

Table 1 Plant-based chemicals in treating respiratory disorders

Phytochemicals	Disease
Androsin	Bronchial asthma
Apple polyphenol	High blood pressure in the lungs
Curcumin	Bronchitis, emphysema, cystic fibrosis
Ligustrazine	High blood pressure in the lungs
Quercetin	Asthma, COPD, pneumonia, pulmonary hypertension
Resveratrol	Asthma, COPD, pneumonia, pulmonary hypertension, pneumonia, sarcoidosis
Salidroside	High blood pressure in the lungs
Triterpenoids	Pulmonary hypertension, chronic bronchitis

3 Medicinal Plants as Beneficial Agents

The reduction in blood pressure diastolic and activity of sympathetic nervous system and the induction of more relaxed, calmed, and natural sentiments are only a few of how nature and active plant engagement are thought to benefit physical and mental health [5]. Plants are the most common form of life and are widely believed to be the most emblematic component of a natural setting. It is important to remember that indoor plants have their unique challenges that cannot be faced in the outdoors. As a result, houseplants can be read in two ways [6] either as a representation of nature or as a product of human engagement with the natural world. The presence of even a small number of houseplants has been linked to fewer sick days taken at work and a greater sense of satisfaction, comfort, and well-being. The visual density of urban tree coverage has been found to positively correlate with both stress recovery [7] and landscape choice [8] in various studies. There should be more interest and use of energy-efficient indoor plants that can improve air quality and moderate local climate. There are plant species and cultivars that are particularly effective at removing volatile organic chemicals [9]. Diffusion of volatile organic molecules into a plant's leaf depends on several factors, including the leaf's stomatal features, wax layer, and hair growth, all of which vary from plant to plant [10]. Members of the Araliaceae family tended to have intermediate to high removal rates of organic compounds which are highly volatile, as compared to the family of Araceae which have demonstrated low [11] rates of removal. Ferns, followed by herbs, had the highest formaldehyde elimination rates, according to research by [10]. Dry deposition and atmospheric dispersion are two mechanisms that vegetation can use to its advantage to improve air quality [12]. The study of dry deposition, which analyses the procedure by which pollutants are at least momentarily removed from the ambient air, takes into account interception, sedimentation, capture, biological processes, and other factors. Pollution levels can be lowered locally by the use of green infrastructure. Many studies have found that persons who reside in more peaceful environments (rural areas, big green spaces) report higher levels of happiness [13]. Vegetation in urban areas might mitigate some of the adverse effects of noise pollution caused by human activity [14]. Certain green areas can provide thermally comfortable circumstances because they permit deeper water penetration into the ground, increasing the amount of water available for evaporation and so aiding in the further cooling of the surrounding air [15]. The Ministry of AYUSH (Government of India) has occasionally issued distinct guidelines for the treatment of respiratory issues dependent on different medicine systems of India. A respiratory infection called bronchitis is marked by a rise in mucus production and airway inflammation [10]. It is challenging to separate from other illnesses, such as influenza, the common cold, etc., that frequently cause cough. In the upper respiratory, mild viral infection system is referred to as the "common cold." Each year, separate influenza outbreaks, a viral infection of the respiratory system, occur. According to Rawal et al. [16], acute respiratory distress syndrome is a fatal inflammatory lung injury that develops along with the acute failure of the respiratory as a consequence of clearly identified non-pulmonary and pulmonary insults [17]. Emphysema is characterized by persistent breathlessness and an inability to tolerate physical exercise due to damage to the respiratory membrane. There is evidence of a rise in neutrophils, macrophages, T-lymphocytes, and eosinophils in the terminal air spaces and emphysematous tissue of the pulmonary parenchyma. A deteriorating lung condition called COPD is marked by airway narrowing. The inflammatory reaction causes emphysema in the small air cells but chronic bronchitis in the larger airways [18]. These various methods, which the hospitals use following their areas of expertise and modern medicine primarily as adjuvants and may be pertinent for boosting immunity, treating fevers, or providing other respiratory treatments, are as follows:

3.1 Aush Kwath

The AYUSH Ministry encourages AYUSH kwath used as a pre-made mixture for promoting the general public's health. *Ocimum sanctum* leaves, *Cinnamomum verum* stem barks, *Zingiber officinale* rhizomes, and Piper nigrum fruits make up the mixture. Ayush Kwath, Ayush Kudineer, and Ayush Joshanda are a few of the titles under which the formulation is marketed in the market. The market offers it in tablet and powder shapes. These herbs are effective treatments for different viral diseases and are said to boost immunity [19, 20].

3.2 Samshamani Vati

Ayurvedic medicine, that is, Guduchi ghana vati (Samshamani vati), is used to treat all kinds of fevers. It is also used as an anti-inflammatory and painkiller [21]. Samshamani vati, an aqueous extract of Tinospora cordifolia, is thought to have immunomodulatory activities as a result of the synergistic effects of the many chemicals present [22]. Additionally, it works well for many infectious illnesses.

Hareetaki Agasthaya, a popular "Avaleha kalpana," Agastya Haritaki Rasayana contains more than 15 herbal components and is used to treat a variety of respiratory infections. The majority of its components demonstrated antiviral, anti-asthmatic, anti-inflammatory, and immunomodulatory properties [23–25].

3.3 Anuthaila

Arn. and Retz. (Leptadenia reticulate) Wight has been used in the therapy of throat, bronchitis, and asthma issues. Anuthaila Anuthaila contains about twenty ingredients. Similarly, *Ocimum sanctum* and *Sesamum indicum* oil are suggested for a variety of ailments, including dry cough, asthma, migraines, and respiratory illnesses [26]. There are accounts of *S. indicum* seeds combined with *Tachyspermum ammi* seeds that are being used to treat colds, dry coughs, and lung conditions [27].

3.4 Roghan-e-Baboona

A traditional Unani medicine called roghan-e-baboona is used to manage inflammation and asthma. The primary component of Roghan-e-Baboona is Matricaria chamomilla L. flowers. It is made from *M. chamomilla* flowers, which have been proven to be effective for sore throats and acute viral nasopharyngitis [28].

3.5 Sharbat-e-Sadar

It is a formulation polyherbal syrup of unani region plants and is extensively used for the common cold, cough, and respiratory diseases. A key component, *Trachyspermum ammi*, was found to promote the growth of B-cells and to block the neutralization of antibodies to the Japanese encephalitis virus [29]. According to Singh et al. [30], *Adhatoda vasica* inhibits the HIV protease, and *Bombyx mori* was found to boost immune reactions against viral infection. Other components with antiviral and immunomodulatory properties include *Ziziphus jujuba*, *Glycyrrhiza glabra*, *Onosma bracteatum*, and *Ficus carica*.

3.6 Asgandh Safoof

Withania somnifera Dunal, also known as Asgandh Safoof Asgand, is a widely used medicinal herb in India. In the Unani school of medicine, the root powder is used as an immunomodulator. According to reports, the extract of roots substantially raises counts of CD8+ and CD4+ as well as blood profile measurements, particularly WBC and platelet counts (Bani et al., 2006). By disrupting the connections between the host ACE2 receptor and the viral S-protein receptor binding domain, aqueous suspension prevented SARS-CoV-2 entrance and demonstrated strong inhibitory action against the mitogen-induced proliferative response of T lymphocytes [31].

4 PH Treatment with Medicinal Plants

4.1 Allium Sativum

The plant species Garlic (*Allium sativum* L.) has been utilized in traditional medicine for centuries. Cysteine sulfoxides and other sulphur-containing compounds are primarily responsible for the therapeutic effects of *A. sativum*. The category includes allicin, which has the potential to be converted as thiosulfinates [32]. It has been shown that *A. sativum* has therapeutic effects, including as lowering the level of glucose in the blood, decreasing oxidative stress, fighting cancer, as well as reducing inflammation, boosting the immune system, warding off infections, and protecting the heart [33]. *A. sativum* may have the ability to hyperpolarize the membrane of smooth muscle cells, eNOS activity increases, and thereby relax vascular smooth muscles. According to research by Fallon et al. (1998), the vasorelaxant action of a fine extract in the powder form of *A. sativum* can slow the pH development in rats exposed to hypoxia. These are Bunge Allium macrostemon. Traditional Chinese medicine makes use of Bunge Allium macrostemon, a member of the family having Amaryllidaceae, for its many pharmacological activities, including those of being antitumourous, antiasthmatic, antioxidant, and immune-enhancing immunity [34]. The primary component of *A. macrostemon* is dimethyl disulphide (DMDS), which has several biological functions including melanin synthesis regulation, anti-hypertensive and anti-inflammatory, and is thus utilized for myocardial ischemia treatment [35].

4.2 Allium Ursinum

Also known as bear's garlic or wild garlic, it is a plant that is endemic to Eurasia. It is an Amaryllidaceae family member. It has a long history of application in alternative medical practices [36]. *A. ursinum* is capable of producing a miscellaneous set of chemical structures, which are ultimately responsible for the organism's biological activity. The aroma, which is reminiscent of garlic, is caused by flavonoid glycosides and sulphur components, which are two of the most important chemicals. Several of the chemicals produced by *A. ursinum*, such as phytosterols and galactolipids, are unique to the species [37]. On human platelets it may be antiaggregatory effects, inhibition effect on 5-LOX (5-lipoxygenase), and synthase of prostaglandin-endoperoxide (PTGS) enzymes in conditions of in vitro, high antioxidant activity and biosynthesis of cholesterol inhibition in vitro are few essential pharmacological activities that are exhibited by *A. ursinum*. Other important pharmacological activities include the following. In addition to this, its activity has been linked to blood pressure reduction as well as an inhibition of the PDE 5A (phosphodiesterase enzyme). *A. ursinum* contains flavonoids and saponins, both of which have the potential to suppress the activity of PDE5A [38]. There have been reports of an upregulation of PDE5 in PH [39]. Remodelling of vascular pulmonary and RVH can be described through the rise of RV/(LV + S) ratio and thickness of pulmonary arterial wall, respectively. In contrast to untreated hypertensive rats which are untreated, rats having pulmonary hypertension treated with *A. ursinum* are shown to be remodelling the pulmonary vascular and RVH [40] (Table 2).

4.3 Mimosa Pigra

Throughout Africa, the Americas, and Asia, the *Mimosa pigra* L. is widely used as a medicine due to its status as a member of the Fabaceae family. This plant is used against a variety of conditions, including heart problems, gastrointestinal issues, and infections [41]. In a research on the pharmaceutical potential of *Mimosa pigra* against hypoxia-induced PH in rats, Rakotomalala et al. (2013) discovered that *Mimosa pigra* can upregulate NO generation, downregulate PAP and RV/(LV + S) and p38 MAPK expression and phosphorylation in lung tissue. In rats with pulmonary hypertension, P38 MAPK is activated [42]. This research suggests that *M. pigra* may have a beneficial effect on PH outcomes.

4.4 Trifolium Pratense

Trifolium pratense, or Red clover, is a member of the Fabaceae family of plants. Its original range includes West Asia, Europe, and Northwest Africa. *T. pratense* relies heavily on several different flavonoids [43] for its health benefits. *T. pratense* contains isoflavones, which a recent study on animal models found to inhibit delicate muscle contractions in the uterus, ileum, and bladder [44]. Jiang and Yang (2016) showed that feeding broiler chickens with PH an extract of T. *pratense* containing isoflavones decreased ET-1 in the hens' serum and lungs while simultaneously increasing NOS secretion. To a greater extent, ET-1 can stimulate MMP-2 expression, which is associated with respiratory vascular remodelling [45]. *T. pratense* can raise serum levels of NOS and NO due to its phytoestrogen activity [46]. These results imply that Trifolium pratense isoflavones may be useful for treating PH in avian models, where it has been observed to increase NO and decrease ET-1 expression.

4.5 Tulsi (Ocimum Sanctum)

A sacred Hindu herb that has a very large history of medical usage and is now being studied for its potential to alleviate symptoms of bronchial asthma and bronchitis. Tulsi's main ingredient, Eugenol, has a variety of therapeutic effects, including antimicrobial, analgesic, antispasmodic, and adaptogenic. Symptoms of bronchitis and the duration of the illness were reduced in randomized, double-blind, placebo-controlled clinical trials with the combination of primrose root tincture and thyme

Table 2 Medicinal plants used for various diseases

Name of the plant	Scientific name and family	Methods used	Parts used	Purpose of use
Spiny amaranth	*Amaranthus spinosus* Amaranthaceae	Decoction	Foliage	Used for treatment of cough and asthma
Mango	*Mangifera indica* Anacardiaceae	Freshly consumed and decoction	Foliage and fruits	Wound cuts and diabetes can be cured
Soursop	*Annona muricata* Annonaceae	Freshly consumed and decoction	Foliage and fruits	Kidney infection, diabetes, hypertension, and wound cuts
Custard apple	*Annona squamosa* Annonaceae	Poultice	Foliage	Stomachache and headache
Indian snakeroot/ Sarpagandha	*Rauwolfia serpentina* Apocynaceae	Decoction	Foliage	Cure cold and cough
Bagawak	*Philodendron lacerum* Araceae	Poultice	Foliage	Sprain and stomachache
Aloe	*Aloe vera* Asphodelaceae	Extraction	Foliage	Burning of the skin
Common mugwort	*Artemisia vulgaris* Asteraceae	Decoction and poultice	Foliage	Diseases of the lung, blood vomiting, ringworm, and cough
Sambung	*Blumea balsamifera* Asteraceae	Decoction	Foliage	Cold, headache, flu, fever, urinary tract infection, and stomachache
African marigold	*Tagetes erecta* Asteraceae	Pounding and poultice	Leaves	Wound and cuts
Fukien tea tree	*Carmona retusa* Boraginaceae	Poultice	Leaves	Cough and body pain
Indian cherry	*Carmona dichotoma* Boraginaceae	Decoction	Leaves	Post-delivery fever
Papaya	*Carica papaya* Caricaceae	Pounding and extraction	Leaves	Malaria and dengue
Rangoon creeper	*Quisqualis indica* Combretaceae	Decoction	Leaves	Kidney infection
Sweet potato	*Ipomea batatas* Convolvulaceae	Decoction	Leaves	Diabetes and cut and wound infection

(continued)

Table 2 (continued)

Name of the plant	Scientific name and family	Methods used	Parts used	Purpose of use
Bitter-melon	*Momordica charantia* Cucurbitaceae	Cooking and extraction	Leaves and fruits	Diabetes and cut and infection of the wound
Alingaro	*Elaeagnus alingaro* Elaeagnaceae	Decoction	Roots	Headache, stomachache, Kidney infection, muscle pain, gall bladder stone and liver disease
Chinese laurel	*Antidesma bunius* Phyllanthaceae	Decoction	Foliage	Arthritis and kidney infection
Croton	*Codiaeum variegatum* Euphorbiaceae	Poultice	Foliage	Body pain
Snake weed	*Euphorbia hirta* Euphorbiaceae	Decoction	Stem, leaves and roots	Malaria and dengue
Physic nut	*Jatropha curcas* Euphorbiaceae	Poultice	Foliage	Sprain and stomachache
Bitter cassava	*Manihot esculenta* Euphorbiaceae	Decoction	Foliage	Diabetes, wound and cuts
Quick stick	*Gliricidia sepium* Euphorbiaceae	Pounding	Foliage	Vomiting, diarrhoea, and kidney infection
Lima bean	*Phaseolus lunatus* Euphorbiaceae	Cooking	Seeds	Diabetes and wound infection
Glorybower	*Clerodendrum intermedium* Fabaceae/ Lamiaceae	Poultice	Foliage	Sprain and stomachache
Spearmint	*Mentha spicata* Lamiaceae	Decoction	Foliage	Cold, cough, and headache
Common basil	*Ocimum basilicum* Lamiaceae	Decoction	Foliage	Cough and cold
Oregano	*Origanum vulgare* Lamiaceae	Decoction	Foliage	Cold, cough, headache,
Cat's whiskers	*Orthosiphon aristatus* Lamiaceae	Decoction	Foliage and roots	Kidney infection
Painted nettle	*Plectranthus scutellarioides* Lamiaceae	Poultice	Foliage	Kidney infection, cold, and cough

(continued)

Table 2 (continued)

Name of the plant	Scientific name and family	Methods used	Parts used	Purpose of use
Fragrant premna	*Premna adorata* Lamiaceae	Extraction and poultice	Foliage and stem	Skin disease and allergies
Chinese chase tree	*Vitex negundo* Lamiaceae	Decoction	Foliage	Cough and cold
Cinnamon	*Cinnamomum mercadoi* Lauraceae	Decoction	Foliage	Vomiting, nausea, and hypertension
Avocado	*Persea Americana* Lauraceae	Decoction	Foliage	Kidney infection, stomachache, hypertension, and diabetes
Queen's flower	*Lagerstroemia speciosa* Lythraceae	Decoction	Foliage	Kidney infection
Drumstick tree	*Moringa oleifera* Moringaceae	Eating in a fresh state and decoction	Fruits and foliage	Diabetes and wound Infection
Guava	*Psidium guajava* Myrtaceae	Decoction	Foliage	Diarrhoea, wounds and cuts Infection
Java plum	*Syzygium cumini* Myrtaceae	Eating in a fresh state and decoction	Fruits and foliage	Diabetes and wound infection
Bilimbi	*Averrhoa bilimbi* Oxalidaceae	Decoction	Foliage	Fever
Screw pine	*Pandanus tectorius* Lythraceae	Decoction	Foliage	Fever and cold, stomachache, flu, kidney infection, wounds cuts infection, and diabetes
Pepper elder	*Peperomia pellucida* Moringaceae	Decoction	Foliage	Body pain and hypertension
Betel pepper	*Piper betle* Myrtaceae	Poultice	Foliage	Sprain
Love grass	*Chrysopogon aciculatus* Poaceae	Decoction	Roots	Stomachache, headache
Cogongrass	*Imperata cylindrica* Poaceae	Decoction	Roots	Muscle pain, headache, stomachache, liver disease, kidney infection, and gall bladder stone
Calamondin	*Citrofortunella microcarpa* Piperaceae	Extraction	Fruits	Cold and cough

(continued)

Table 2 (continued)

Name of the plant	Scientific name and family	Methods used	Parts used	Purpose of use
Star apple	*Chrysophyllum cainito* Sapotaceae	Eating in a fresh state and decoction	Fruits and foliage	Diabetes and wound infection
Bell pepper	*Capsicum annuum* Poaceae	Poultice	Foliage	Boil and wounds
Burr bush	*Triumfetta bartramia* Tiliaceae	Decoction	Roots	Muscle pain, headache, stomachache, kidney infection, gall bladder stone and liver disease
Turmeric	*Curcuma longa* Rutaceae	Decoction	Rhizome	Stomachache

fluid extract [47]. Some research [48] also shows that ivy (*Hedera helix*) leaf extract helps reduce chronic bronchitis symptoms. In contrast to thymoquinone, a different phytochemical, nigellone, derived from black cumin was reported to display anti-spasmodic and facilitative effects on pulmonary clearance [49].

4.6 Argemone Mexicana (Papaveraceae)

Brahmadandi, the Indian plant *A. mexicana*, is a regular sight along highways there. The most active compounds identified from *A. mexicana* for the curing of asthma are berberine and protopine [50]. Native Andhra Pradesh residents have found success in treating asthma by taking a powder made from the seeds two times a day for 2 weeks [51]. At a concentration of 50 mg/kg, aqueous extracts from the stem of *A. mexicana* have been shown to reduce milk-induced leukocytosis and eosinophilia, two hallmarks of the allergic response [52].

4.7 Piper Longum (Piperaceae)

Piperine extracted from *P. longum* (long pepper) fruit has shown antiasthmatic and anti-bronchitis action (Hussain et al., 2011), and the plant is native to India. Alkaloids, steroids, glycosides, and flavonoids are all present in *Piper longum* fruit. The guinea pig's bronchospasm caused by histamine was successfully reduced by the fruit [47].

4.8 Tamarindus Indica (Fabaceae)

Breathing disorders, vaginal and uterine symptoms, and inflammation are just a few of the many conditions that *T. indica* (Tamarind), a traditional tropical medicine, is renowned for treating in folk medicine. Researchers have found that an extract of *T. indica* leaves has potent anti-asthmatic activity due to its bronchodilating, anti-histaminic (H1-antagonist), and anti-inflammatory properties [53].

4.9 Ageratum Conyzoides

The New World's tropical regions are home to the annual herb *Ageratum conyzoides*, abbreviated as *A. conyzoides*, which is a member of the Asteraceae family (previously the Compositae). Yet, it is also found throughout the rest of the world's tropical and subtropical climates. This plant's hydro-alcoholic leaf extract has been shown to have significant antihistaminic activity and to prevent clonidine-induced catalepsy in rats when given orally at doses of 250–1000 mg/kg [54].

5 Phytochemicals Used for PH Treatment

The Orchidaceae genus includes the *Eulophia macrobulbon* (Corduroy orchid) species. In Asia, Europe, and America, conventional medicine frequently makes use of orchids. Narkhede et al. (2016) state that they also treat cancer, diabetes, autoimmune, and inflammatory illnesses, as well as pulmonary and other diseases. PDE5 inhibitors, flavonoids, and terpenoids are present in the ethanolic extract of *E. macrobulbon*, indicating that it may be a pulmonary vasodilator [55]. A treatment with an ethanolic extract of *E. macrobulbon* decreases calcium chloride 2–induced in vitro contraction of PA rings and lowers the ratio (RV/LV + S), according to research on MCT-induced PH in rats by Wisutthathum et al. [56]. Pigs with high cholesterol have their coronary arteries relaxed by *E. macrobulbon* extracts because of stilbenes and their compounds. As a result, it has been proposed that *E. macrobulbon* extract may regulate pH and cause PAs (like coronary arteries) to relax.

5.1 Apple Polyphenol

Especially treat conditions like gastric mucosal injury, cancer, inflammation, and cardiovascular disease, doctors often prescribe apple polyphenol, a chemical extracted from several apple fruits (*Malus* spp.) [57]. Apple polyphenol can influence hemodynamic indicators such as mPAP and PVR, which may reduce the contraction of pulmonary vascular rings, as discovered by Hua et al. [58] in their investigation of hypoxia-induced PH in rats. It reduces cytosolic Ca2+ in PASMCs in vitro. Apple polyphenol increases eNOS expression, boosts NO levels, and reduces caspase-3 and iNOS expression in PAEC at the genetic level. Our results demonstrate that apple polyphenol has therapeutic potential as a treatment for PH, as it reduces contraction and increases NO levels to bring about its therapeutic impact.

5.2 Asiaticoside

The saponin asianoside, isolated from the plant *Centella asiatica* (L.) Urb., has a wide variety of biological activities that have led to its widespread use in traditional medicine. These include effects on temporary cerebral ischemia and reperfusion that are antioxidant, anti-inflammatory, antihepatofibrotic [59], and neuroprotective. In research of hypoxia-induced PH, [60] discovered that asiaticoside therapy decreased RVH and mPAP while simultaneously increasing cGMP and NO concentrations and decreasing ET-1 concentrations in the blood. Not only does this chemical prevent apoptosis in endothelial cells, but it also stimulates nitric oxide synthase (NOS) and activates AKT. Evidence suggests that asiaticoside can influence NO production, which slows the development of PH via phosphorylating and activating the serine/threonine protein kinase/eNOS pathway. According to research by Wang X. B. et al. [61] on hypoxia-induced PH in rats and PASMCs, treatment with asiaticoside raises RVH and mPAP, lowers the production of TGF-bR2, TGF-b1, and TGF-bR1, and inhibits the phosphorylation of Smad2/3 in lung tissue of animals. Smad2/3 phosphorylation is shown to increase when PH develops. Asiaticoside decreases both the quantity and migration of PASMCs, as well as the expression of TGF-b1. Thus, asiaticoside inhibits cell growth and encourages cell death through apoptosis to deliver its therapeutic benefits [61] (Fig. 1).

5.3 Astragalus Polysaccharides

The polysaccharides in *Astragalus membranaceus* Fisch. ex Bunge is the actual chemical responsible for the plant's many pharmacological effects, including its anti-inflammation and antioxidant properties [62]. According to Yuan et al. (2017), therapy with astragalus polysaccharides improves hemodynamic indicators

Fig. 1 Medicinal properties of phytochemicals

including PVR, RVH, mPAP, and medial wall thickness in rats with MCT-induced PH. Increased levels of NO and overexpression of eNOS were also noted in the therapy groups. Astragalus polysaccharides were effective in reducing pro-inflammatory mediator levels. The pho-IkBa expression level was also shown to be decreasing. Astragalus polysaccharides, from the research, can be an effective treatment for PH by inhibiting inflammation and by boosting NO levels, which improves hemodynamic indicators. Pho-IkBa is a marker for the evaluation of inflammation.

5.4 Baicalin

Flavonoid baicalin is extracted from the roots of the Scutellaria baicalensis Georgi plant and has several pharmacological effects, including antioxidant, anticancer, anti-inflammatory, and apoptosis-inducing [59]. Because of its anti-fibrotic effect, baicalin has been shown to reduce collagen I expression. It was shown by Wang et al. [61] that hypoxic conditions play a role in PH via pulmonary arterial collagen. In their investigation of hypoxia-induced PH, Liu et al. (2015) found that baicalin treatment improved hemodynamic parameters such as mean arterial pressure (mPAP), mean systemic arterial pressure (mSAP), and right ventricular (RV)/(LV + S) percent. Collagen I is a marker of PH development in lung tissue, and baicalin inhibits its protein and mRNA expression. Baicalin has a much larger effect on protein expression, collagen I mRNA than it does on collagen III, which is worth noting. Baicalin reduces collagen I expression by increasing ADAMTS1 expression. As baicalein inhibits collagen I synthesis and improves hemodynamic parameters, it may be useful as a therapy for PH [63].

5.5 Rhodiola Tangutica

Golden root, also known as *Rhodiola tangutica*, is a significant plant used in Qinghai and Tibetan ancient medicine. This plant is used to cure a range of diseases, most notably to avoid colds brought on by high altitude [64]. Phenylethanols, flavonoids, and terpenoids are a few of the *R. tangutica* enrich fraction's physiologically active compounds [65]. According to Yuan et al. (2017), therapy with astragalus polysaccharides improves hemodynamic indicators including PVR, RVH, mPAP, and medial wall thickness in rats with MCT-induced PH. These three proteins are essential for the transition of the cell cycle from G0/G1 phase to S phase. A regulator of CDKs is P27kip1. As a result, controlling these variables can reduce cell proliferation, which in turn reduces medial vessel thickness and contributes to structural alterations in pulmonary hypertension. In a lab study on isometric tension changes brought on by a force transducer in rat's pulmonary artery verified the vasorelaxant activity of *R. tangutica* [63]. As a result, these investigations suggest that *R. tangutica* may be used as a successful pH treatment.

5.6 Andrographis Somnifera

In particular in India, ashwagandha, a plant belonging to the Solanaceae family, is utilised as a herbal remedy to treat a number of diseases [66]. HPLC study identifies withanolide A and withaferin A as the most important active components in *W. somnifera* root powder extract. *W. somnifera* is used medicinally to treat a number of ailments, such as cancer, Alzheimer's, ageing, inflammation, and bone-building [67]. It is also used to lower blood pressure and cholesterol levels [66]. Kaur et al. (2015) discovered that therapy with *W. somnifera* can lessen RVP and RVH as well as PCNA expression in a study on MCT-induced pulmonary hypertensive mice. Procaspase-3 expression rises as a result of the *W. somnifera* therapy, inducing apoptosis in the pulmonary vessels. Additionally, *W. somnifera* therapy might lower the ROS concentrations in pulmonary tissue. Its anti-inflammatory impact is related to the ability of it to raise IL-10 levels while lowering NFkB and TNF-a levels. Withanolides discovered that *W. somnifera* has an anti-inflammatory impact by inhibiting TNF-a, which in turn inhibits the activation of NFkB [68]. *W. somnifera* also alters the expression of HIF-1a and eNOS in lung tissue (HIF-1a increases in hypoxia conditions). Increased eNOS action may result in higher NO levels, which relax the blood vessels. *W. somnifera* antioxidant, vasorelaxant, and anti-inflammatory properties make it a promising herb for the treatment of PH.

5.7 Luteolin, Apin, and Rhoifolin

Luteolin, Apiin, and Rhoifolin are three kinds of flavonoids used in traditional medicine. Studies have shown that the bulk of plants and veggies contain flavonoids. These flavonoids have biochemical and pharmaceutical effects that include anti-inflammatory, anti-allergic, and spasmolytic properties. The slow cardiac fibres of dogs may be inhibited by luteolin, apiin, and rhoifolin, which can also lower aortic pressure and capillary respiratory pressure in healthy animals. In a research on hypoxia-induced hypertension in dogs, Occhiuto and Limardi [69] showed that structural changes in the flavonoids (apiin, rhoifolin, and luteolin) significantly alter their antihypertensive activity. They showed that rhoifolin decreases aortic pressure but has no effect on pulmonary vascular resistance, whereas apiin and luteolin exhibit antihypertensive characteristics.

5.8 Resveratrol

Resveratrol has a polyphenolic composition and is a potent antioxidant. Due to its numerous biological effects, it has a variety of medicinal uses, including anti-inflammatory, antioxidant, and anti-aging properties [70]. Because it prevents ACT, which promotes apoptosis in human endometrial cancer cells [71], resveratrol possesses anticancer characteristics. Guan et al.'s [72] study on hypoxic pulmonary artery smooth muscle cells (PASMCs) shows that resveratrol administration may inhibit PASMC migration and proliferation, which in turn might reduce p-AKT and AKT expression in PAMSCs. Aside from that, MMP-2 and MMP-9 production is decreased by resveratrol. Due to MMPs' activation of the PI3K/AKT signalling pathway, PASMC migration and proliferation are enhanced [73]. Resveratrol may boost NO production, reduce oxidative stress, inflammation, and cell proliferation, according to some research. As a result, it might enhance PH and pulmonary artery endothelium performance. Resveratrol can also stop the contraction and inflammation that lead to PAH in the rat pulmonary artery dysfunctions and cardiac myocyte hypertrophy [74]. In a study on hypoxia-induced PH in vitro and in vivo, Xu et al. (2016) showed that resveratrol has the ability to improve PH and reduce inflammatory mediators in the lungs of rats. Additionally, resveratrol treatments cause a decrease in H2O2 in the lungs of rats. According to Prabhakar and Semenza [75], ROS and NO boost HIF-1a expression whereas resveratrol's antioxidant activity decreases HIF-1a expression. HIF-1a is a crucial gene in the evolution of PH. Resveratrol boosted the expression of the proteins Trx-1 and Nrf-2. Antioxidant proteins like Trx-1 are balanced by the antioxidant sensor Nrf2. Resveratrol boosts SOD and GSH production, Trx-1 and Nrf-2 protein levels, and PASMC growth. It also reduces ROS, H2O2 production, and HIF-1a expression. These indicators demonstrate the potency of resveratrol as an antioxidant. In contrast to resveratrol, a synthetic substance called trimethoxystilbene (TMS) is produced by methylating resveratrol and has more activities [31]. Increasing the involvement of apoptosis and reducing cell proliferation, TMS is more effective than resveratrol in treating pH, according to a 2012 research by Gao et al. on PASMCs. Resveratrol is therefore proposed to be a potent treatment for PH because of its antioxidant and anti-proliferative properties.

5.9 Carvacrol

The leaves of the herbs thyme (*Thymus* spp.) and oregano (*Origanum* spp.) are the source of the phenolic compound carvacrol. Pharmacologically, carvacrol has been shown to have antiviral, antibacterial, anticancer, and antioxidant effects. In a study of hypoxia-induced PH in rats, Zhang et al. (2016) found that carvacrol decreased RVH and pulmonary artery thickness. By boosting GSH and SOD activity and lowering MDA levels in pulmonary artery vascular smooth muscle cells, it can also mitigate oxidative stress. Carvacrol treatment decreases Bcl-2 (anti-apoptotic protein) protein expression and mRNA, enhances caspase-3 expression, and decreases Procaspase-3 expression. Apoptosis is inhibited and cell survival is promoted by ERK1/2 and Akt. The ERK1/2 and PI3K/Akt pathways are also down-regulated by carvacrol therapy. These results show that carvacrol can reduce oxidative stress and increase apoptosis in PASMCs, both of which are important in reducing PH.

5.10 Nobiletin

Flavonoid nobiletin originates in the rinds of citrus fruits. In light of its wide range of biological actions, including antioxidant, anti-inflammatory, and anti-tumour effects, this molecule has several potential uses [76]. According to Cheng et al. (2017) in a research of MCT-induced pulmonary hypertensive rats, treatment with nobiletin enhances hemodynamic markers such as RVSP and RVH, suggesting that it has a positive impact on hypoxia-induced respiratory vascular remodelling. Nobiletin prevents the phosphorylation of Src, STAT3, and PDGF-BB in vitro, which prevents the expression of Pim1 and NFATc2, two Src and STAT3 target genes. In the end, this chain of genes acts to halt further cell division. Therefore, nobiletin's ability to block the proliferation-promoting Src/STAT3 axis means it can slow the development of pH.

5.11 Panax Notoginseng Saponins

The biological and therapeutic effects of *Panax notoginseng* Saponins (PNS) are used in Therapeutic Potential and Cellular Mechanisms (TCM). They include antioxidant, vasorelaxant, and inhibitory impact on vascular smooth muscle receptor of the voltage-gated Ca2+ channels [35]. Injecting PNS into rats with hypoxia-induced pulmonary hypertension improved hemodynamic indicators like mean pulmonary arterial pressure (mPAP), mean capillary permeability (mCAP), and right ventricular to left systolic ratio (RV/(LV + S)), and thus decreased p38MAPK mRNA expression in lung tissue of these rats. The expression of P38MAPK, a key indicator of physiological stress, rises as PH worsens. Research suggests that PNS may be an option for treating PH.

5.12 Quercetin

In addition to its anti-inflammatory, antioxidant, anti-tumour, anti-proliferative, inducing apoptosis, anti-metastatic, vasodilator, and blood pressure-lowering properties, the flavonoid quercetin is found in a wide variety of plants and fruits. Quercetin may also slow the development of pH in rats, according to certain studies. Quercetin treatment improves hemodynamic markers such PAH and RVH, as shown in research of hypoxia-induced PH in rats by He et al. (2015). By blocking the TrkA/AKT signalling axis, quercetin suppresses PASMC growth and triggers apoptosis in the cells. Increased expression of BAX and decreased expression of Bcl-2 were both found to occur after quercetin administration. Protein expression of cyclin D1 is upregulated by quercetin, while cyclin B1 and Cdc2 are downregulated. Cell migration regulators including MMP2, MMP9, CXCR4, integrin b1, and integrin a5 are under their control because of their ability to suppress their expression. All medicinal effects of herbs and phytochemicals are triggered by one of six mechanisms:

(a) **Antiproliferation:** Antiproliferative effects can be achieved through the use of plant extracts and phytochemicals such as *W. somnifera*, *R. tangutica*, genistein, berberine, magnesium lithospemate B, isohynchophylline, nobiletin, and quercetin all of which work by inhibiting the expression of genes or suppressing pathways involved in cell proliferation. Reducing the expression of CDK 4 and 6, cyclin D1, PDGF-BB, PP2AC, and PCNA while simultaneously increasing the expression of the p27kip1 (cyclin inhibitor) marker, which suppresses the ACT/GSK3b and Trk A/ACT pathways, leads to decreased cell proliferation [65].

(b) **Antioxidant:** The antioxidant effects of *B. vulgaris*, *C. rhipidophylla*, *K. odoratissima*, *M. oleifera*, *T. pratense*, carvacrol, *T. arjuna*, oxymatrine, magnesium lithospemate B, and resveratrol in the treatment of PH occur via increases in GPx, SOD, CAT, and GSH and decreases in ROS, H2O2, and MDA. These metrics point to less oxidative stress and less tissue damage overall [72].

(c) **Antivascular remodelling:** It has previously been explained that vascular remodelling is a crucial event in the development of PH. Several plant extracts and phytochemicals have their effects by inhibiting the process of vascular remodelling by first reducing ET-1 expression and then MMP-9 and MMP-2 production. As an example, *K. odoratissima*, *C. rhipidophylla*, *T. pratense*, *S. miltiorrhiza*, baicalin, asiaticoside, punicalagin, ginsenoside Rb1, and resveratrol are all examples of plant extracts and phytochemicals that have a vascular anti-remodelling effect and thus inhibit the progression of PH [60, 72].

(d) **Vasodilator:** Increased blood vessel constriction and subsequent PH is a major contributor to PH. The major vascular relaxation inducers reduce TXA2 and cytosolic Ca2+ levels while boosting NO levels by increasing eNOS expression. *A. sativum, A macrostemon, K. odoratissima, E. macrobulbum, S. miltiorrhiza, M. pigra, T. pratense, S. securidaca, W. somnifera*, Apple polyphenols, polydatin, and resveratrol are all examples of plant extracts and phytochemicals with these characteristics [54].

(e) **Apoptosis inducer:** Wsomnifera, T. arjuna, baicalin, apple polyphenols, isohynchophylline, carvacrol, quercetin, punicalagin, salidroside, and resveratrol are only a few phytoextracts and phytochemicals that have been demonstrated to enhance apoptosis and hence improve PH. They carry out their function by suppressing the activity of ERK1/2/STAT3 and PI3K/ACT, limiting the action of growth factors like HIF-1a, TGF-b1, and AhR, or increasing the expression of apoptosis-inducing genes like bax and caspase-3 while concurrently decreasing the expression of BCL2 (an anti-apoptosis factor). By causing lung tissue cells, PAECs, and PASMCs to undergo apoptosis, these chemicals stop the progression of PH [58].

(f) **Anti-inflammation:** Increased inflammation is a significant mechanism in PH. It has been demonstrated that a variety of phytochemicals and plant extracts, such as Astragalus polysaccharides, *Withania somnifera*, punicalagin, oxymatrine, and resveratrol, can reduce levels of inflammatory mediators such IL-6, IL-10, TNF-a, IL-1b, NFkB, VEGF, and pho-IkB, which in turn can reduce chronic inflammation. As a result, they can halt the inflammatory process, which in turn slows the development of PH [70].

6 Pulmonary Disease Treatment Using Indian Herbal Medicine

6.1 Asthma

The candlenut tree (Aleurites moluccana) may be found all over the United States and has long been used as a folk remedy for a variety of ailments, including bronchial asthma, joint discomfort, fever, and migraines. This is because it has several beneficial qualities, including anti-viral, anti-nociceptive, anti-hypersensitivity, and anti-microbial [77]. Studies on a semisolid herbal medication made from *A. moluccana* leaf extract show promise as a phytomedicine for the treatment of asthma [78]. This extract showed anti-inflammatory, analgesic, and wound-healing properties in pre-clinical experiments. The therapeutic benefits of *Nigella sativa* (Black cumin) extracts are extensive and include but are not limited to the following: anti-inflammatory, anti-oxidant, antihistaminic, anti-allergic, immunomodulatory, antitussive, and bronchodilatory effects. Patients' asthma symptoms were reduced when they were given *N. sativa* seed, boiling extract, or oil, according to clinical trials [79]. Mountain knotgrass, or *Aerva lanata*, is a widespread weed that thrives in the country's warmer plains. The ethanol extract of this plant has anti-asthmatic properties due to its ability to cause catalepsy and degranulation of mast cells [80]. One additional medicinal herb that can stabilize mast cells is *Bacopa monnieri* (Brahmi). Extracts from medicinal plants like *Bauhinia variegate* (Rakta Kanchnar), *Cassia sophera* (Kasaunda), *Casuarina equisetifolia* (Whistling Pine), and *Clerodendrum serratum* (Bharangi) have the potential to treat asthma by inhibiting immune responses like bronchial and tracheal constriction brought on by histamine and clonidine.

6.2 Chronic Obstructive Pulmonary Disease

In addition to its usage as a Siddha medicine, the leaves and fruits of the *Solanum nigrum* (Manathakkali) plant are commonly utilized as a culinary item throughout most of India. Inflammation-induced oedema can be reduced by using extracts from its leaves. By blocking the ability of AP-1 and NF-kB to bind to DNA, a glycoprotein isolated from *S. nigrum* was discovered to reduce the production of inflammatory chemicals. Reduced levels of superoxide and nitric oxide, both of which have a great value in the disease physiology of chronic obstructive pulmonary disease (COPD), were observed in those who took an ethanolic extract of *Boerhavia diffusa* (Punarnava). In addition to being able to relax muscles and prevent infection, it also protects cells from damage [81]. Vasadi syrup and Shwasaghna dhuma, two Indian herbal medicines, have been shown to significantly improve COPD symptoms and forced expiratory volume in 1 second (FEV1%) in clinical trials involving patients with COPD. Equal parts of the following ingredients make up the Vasadi syrup: *Curcuma longa* (Haridra), *Justicia adhatoda* (Vasa), *Clerodendrum serratum* (Bharangi), *Coriandrum sativum* (Dhanyaka), *Zingiber officinale* (Shunthi), *Tinospora* *cordifolia* (Guduchi), *Piper longum* (Pippali), and *Solanum virginianum* (Kantakari). Contents of Shwasaghna dhuma are dry leaves of *Datura stramonium* (Dhatura), powder of seeds of *Solanum virginianum* (Kantakari), seeds of *Hyoscyamus niger* (Khurasani ajwain), *Trachyspermum ammi* (Ajwain), *Curcuma longa* (Haridra), Potassium Nitrate (Kalmi shora), and *Cannabis sativa* (Bhanga) in equal parts [82].

6.3 Bronchial Asthma

Ocimum sanctum (Tulsi), an ancient medicinal herb, is effective against both acute bronchitis and chronic bronchial asthma. Tulsi's main ingredient, Eugenol, has a wide range of therapeutic effects, including anti-microbial, analgesic, antispasmodic, and adaptogenic [53]. In double-blind, randomised, placebo-controlled clinical studies, the combination of thyme fluid extract and primrose root tincture decreased bronchitis symptoms and the length of the disease [47]. Some research [48] also shows that ivy (*Hedera helix*) leaf extract helps reduce chronic bronchitis symptoms. In contrast to thymoquinone, a different phytochemical, nigellone, derived from *Nigella sativa* (Black cumin) was reported to display antispasmodic and facilitative effects on respiratory clearance [49].

6.4 Lung Cancer

In Indian cuisine, *Curcuma longa* (Turmeric) is a staple ingredient. In vitro studies using the A549 lung cancer cell line revealed that *C. longa* extract inhibited telomerase activity and exhibited lethal effects in a dose-dependent manner. The phytochemical conferone, which was isolated from the Ferula species, was found to have weak cytotoxic effects against the A549 lung cancer cell line [76]. The cytotoxic action of *Annona muricata* (Mamaphal) can be seen in the A549 lung carcinoma cell line, and this can be traced back to the plant's constituent chemicals, annomuricin A and B [83]. Using a mouse model, researchers showed that alcoholic extracts of *Andrographis paniculata* (Kiryat) had chemopreventive benefits by increasing lung levels of superoxide dismutase, catalase, and DT-diaphorase [30]. An extract of *Phyllanthus urinaria* (Jaramla) demonstrated anti-angiogenic efficacy in a mouse model in which Lewis lung carcinoma cells were implanted by inhibiting neovascularization in the tumour cells as well as the migration of HUVEC [51]. Other medicinal plants that are used to treat lung cancer symptoms include *Glycyrrhiza glabra* (Liquorice), *Zingiber officinale* (Ginger), *Ocimum sanctum* (Tulsi), *Adhatoda vasica* (Malabar nut), and *Terminalia chebula* (Myrobalan) [52].

6.5 Pneumonia

The antibacterial properties of the *Verbascum* species, better known as Mullein, have led to its usage in the treatment of pneumonia as part of traditional herbal medicine.

Verbascum fruticulosum extract showed strong antibacterial activity against the multidrug-resistant *Streptococcus pneumoniae* strain, suggesting its potential for application in the treatment of pneumonia. Similar to the results seen with *V. fruticulosum* [84], the extract of *Urtica urens* (Dwarf nettle) also showed anti-microbial action against *S. pneumoniae* in the same investigation. Beetroots, or *Beta vulgaris*, are a popular vegetable. Antibacterial activity, as measured by a concentration-dependent expansion of the zone of inhibition against Klebsiella pneumonia, was present in alcoholic leaf extracts of *B. vulgaris* fractionated by n-hexane and chloroform [85]. *Nepeta glutinosa* (Benth), *Ficus racemosa* (Gular fig), *Terminalia chebula* (Myrobalan), *Ricinus communis* (Castor bean), and *Vitex negundo* (Chaste tree) are some other medicinal plants that have been used to cure pneumonia [86].

6.6 COVID-19

The medicinal plants' essence, such as *Astragalus membranaceous* (Katira), *Cullen corylifolium* (Scurfy Pea), *Agastache rugosa* (Indian mint), *Cassia alata* (Candlebush), *Mollugo cervine* (Carpetweed), *Gymnema Sylvestre* (Gurmar), *Tinospora cordifolia* (Gurjo), and *Quercus infectoria* (Manjakani), is capable of inhibiting the action of coronavirus (Benarba and Pandiella (2020). Due to their ability to inhibit the SARS-CoV-2 mechanism of action by obstructing the activity of spike protein, the primary protease, ACE-2, and their receptor, phytochemicals like curcumin, quercetin, luteolin, withaferin A, apigenin, amaranthin, and gallic acid have the potential to be used as drug candidates [34]. An Ayurveda treatment plan was successful in curing COVID-19 symptoms in a 43-year-old guy, according to a case study. Sudarsana Churna was used to reduce fever, Talisadi Churna was used to restore a sense of taste, and Dhanwantara Gutika was used to help with breathing difficulties [87].

7 Pharmaceutical Industry and Herbal Plants

The plant world naturally contains phytochemicals, which have demonstrated their therapeutic value as a source of a broad range of biological activity [88]. Various active components found in plants allow us to speculate about their possible therapeutic value. Herbivores, microbes, and plants use the structures of secondary metabolites as protection systems within the cell by interfering with molecular targets [89]. For the creation of plant-based medicines and pharmaceuticals, it is extremely beneficial to identify as many chemical units and groups as possible, such as phenol and organic acids, carbohydrates, and amino acids [90]. Terrestrial or marine botanicals can yield biologically active substances, and the value of these substances relies on their characteristics [91]. Plants' nutritional and therapeutic properties lead to effective disease management for a variety of conditions. Plants demonstrate the importance of their flexible ecomorphology for environments. Animal, human, insect, and overall ecosystem well-being are all directly influenced by plants. Farming and herbal gardening are increasingly being studied in depth.

Climate, soil, and geographic variables all have an indirect or direct impact on plant development [92]. Unfortunately, many medicinal plants are in danger of going extinct due to overharvesting, habitat destruction, a lack of sustainable agriculture, and conservation practices. However, by controlling their accumulated secondary compounds, plants can get around many obstacles (physical, biological, and chemical) [93, 94]. Only 6% of the estimated 215,000–500,000 higher plant species in the globe have had their biological activity screened [94]. Economic commerce in more than 2000 different medicinal and aromatic plant species threatens 10% of those species in at least one European country [95]. Over 82% of drug substances are directly derived from natural products, and over 50% of drug substances come from chemicals separated from plants or herbs [96]. According to Markets 2019, the plant extracts industry is expected to grow from its current estimated value of USD 23.7 billion to USD 59.4 billion by 2025. The use of medications to relieve some of the most prevalent respiratory disease symptoms, such as a sore tongue, cough, nasal congestion, etc., is supported by extensive data [14]. In the accessible literature, reports of individual or combined herbal sources have been made. Homeopathy is widely used, and using it has been linked with positive outcomes.

8 Conclusion

In conclusion, medicinal plants have been used for centuries to cure respiratory diseases and provide relief from respiratory symptoms. They contain bioactive compounds that have antiviral, antibacterial, anti-inflammatory, and immune-modulatory properties, which make them effective in treating respiratory infections and diseases. Studies have shown that various medicinal plants, such as ginger, turmeric, eucalyptus, garlic, liquorice, and thyme, can be used to treat respiratory infections and diseases like asthma, bronchitis, and pneumonia. However, it is essential to note that the use of medicinal plants as a treatment for respiratory diseases should not replace conventional medicine but should be used as a complementary therapy. In addition, more research is needed to determine the safety and efficacy of these medicinal plants in the treatment of respiratory diseases. Nonetheless, their use can offer a natural and cost-effective way to manage respiratory diseases and improve overall respiratory health. Therefore, the integration of medicinal plants into respiratory disease management programs can be a promising approach to improving respiratory health outcomes. Medicinal plants have been used for centuries as a natural remedy for respiratory diseases. They offer a variety of therapeutic benefits, including anti-inflammatory, antioxidant, and expectorant properties, which make them an effective treatment option. Many of these plants have been studied extensively, and their efficacy in treating respiratory conditions has been proven by scientific research. Some of the commonly used medicinal plants for respiratory diseases include liquorice root, ginger, eucalyptus, thyme, and peppermint. These plants can be used in different forms such as teas, tinctures, and extracts and they can be easily incorporated into daily routines. While medicinal plants offer a natural and safe alternative to conventional medicine, it is essential to seek medical advice before using them, especially if you have pre-existing medical conditions or are taking medication. Additionally, it is crucial to purchase these plants from a reputable source to ensure their quality and purity. Overall, medicinal plants remain an important component of traditional medicine, and their role in the treatment of respiratory diseases cannot be ignored. With further research and exploration, these plants may provide new avenues for the development of effective and sustainable treatments for respiratory diseases.

Acknowledgment We would like to extend our sincere appreciation and gratitude to the Department of Agronomy at the School of Agriculture at Lovely Professional University, Punjab, 144411, India.

17 Assessment of the Phytochemical Constituents and Metabolites in Medicinal Plants and Herbal Remedies Used in the Treatment and Management of Reproductive Diseases: Polycystic Ovary Syndrome

Prasann Kumar, Subham Saurabh, and Khushbu Sharma

Contents

Abstract

The present study explores the phytochemical constituents and metabolites found in medicinal plants and herbal remedies traditionally used for treating and managing polycystic ovary syndrome (PCOS). This study's primary aims involve identifying, isolating, and characterizing bioactive compounds derived from natural sources. Subsequently, an assessment of their bioactivity will be conducted. Comparative analyses are undertaken to identify the most favorable approaches for managing polycystic ovary syndrome (PCOS), encompassing a thorough evaluation of safety and toxicity considerations. The study aims to establish standardized formulations and conduct clinical trials to assess these natural remedies' practical effectiveness. The primary objective is to develop evidence-based recommendations for

responsibly utilizing medicinal plants and herbal remedies within the polycystic ovary syndrome (PCOS) treatment framework.

Keywords

Antioxidants · Herbal · Infertility · PCOS · Lumen · Reproductive system · No poverty · Zero hunger

Abbreviations

ANT	Anti-Mullerian hormone
DHEA	Dehydroepiandrosterone
ERs	Estrogen receptors
EV	Estradiol valerate
FSH	Follicle-stimulating hormone
IL	Interleukin
IVF	In vitro fertilization
LDLC	Low-density lipoprotein cholesterol
LH	Luteinizing hormone
LPA	lysophosphatidic acid
MDA	Malondialdehyde
NO	Nitric oxide
OC	Ovarian cancer
PCOS	Polycystic ovarian syndrome
TAC	Total antioxidant capacity
TC	Total cholesterol
TG	Triglyceride

1 Introduction

Traditional Asian medicine and plants have been used to treat various illnesses since ancient times. South Korea, Japan, and the tribal and agricultural populations of Bangladesh, China, India, Nepal, and Vietnam [22] for their profitable and user-friendly nature. Due to socioeconomic and geographic circumstances, ethnic people in many Asian nations rely heavily on medicinal plants for their primary healthcare in rural areas. Seventy to eighty percent of the population in developing nations depend on medicinal plants for primary healthcare, and ethnomedicine is becoming more popular in developed nations because it has almost no side effects. Ethnic people rely on the medicinal plants nearby to learn about the economic values and medicinal qualities of many plants and traditional medicine based on their needs, observations, and prior experiences [30]. Research on ethnomedicinal herbal plants led to the discovery of 75% of herbal drugs, and about 25% of modern medicines are derived from sources of widely used medicinal plants. Worldwide, the World Health Organization (WHO) has identified over 21,000 plant types for medicinal purposes.

Ayurvedic medicine, also known as Ayurveda, is a form of complementary and alternative treatment originating in India [6]. Ancient medicine used to treat issues with male reproduction: The herbal remedy made from *Centella asiatica, Hemidesmus indicus,* and *Hibiscus rosa* is used to cure spermaturia*. Helianthus fraternus, Dracaena terniflora*, *Sinensis*, and *Cuminum cyminum* are employed [14]. *Ocimum sanctum* and *Evolvulus alsinoides* are used to boost sperm concentration. To cure impotence, whole *Withania somnifera* is used (Table 1). Traditional medicine used to treat issues with feminine reproduction: *Celastrus paniculatus* and *Hibiscus rosa-sinensis* were used to cure leukorrhea. *Clerodendrum viscosum* and *Premna latifolia* have both been used to treat menorrhagia. Several plants were found to be effective in treating abortion, including *Ensete superbum*, *Mirabilis jalapa*, *Securinega leucopyrus*, *Celastrus paniculatus*, *Gardenia gummifera*, *Ziziphus oenoplia*, *Erythrina indica*, *Ixora coccinea*, and *Ziziphus rugosa*. To address dysmenorrhea*, Ocimum basilicum* and *Tabernaemontana divaricata* were used [16, 20, 21]. It was asserted that *Wrightia tinctoria* and *Diospyros montana* were usually helpful for treating different menstrual disorders and irregularities

Table 1 Plant species involved in disease prevention

Disease	*Plant species*	Part used	Use	Admin
1.	*Manihot esculenta*	Tuber, fresh	Vaginal infection, Vaginal discharge	Oral
2.	*Caesalpinia spinosa* (Molina) Kuntze	Seeds pods	Inflammation of ovaries	Oral
3.	*Ingo edulis* C. Martius	Huaba, Pacae, Guava, Pacai Flowers, fresh	Hair growth	Oral
4.	*Pelargonium roseum* Willd	Geranio	Flowers Uterus pain	Topical
5.	*Illicium verum* Hook.	Seeds, dried	Expel residues of feces in the stomach of newborn babies	Oral
6.	*Origanum vulgare* L.	Leave	Menstrual cramps	Oral
7.	*Salvia officinalis*	Whole plant	Control and regulate the menstrual cycle	Topical
8.	*Malva sylvestris* L.	Leave, stem	Pain	Topical
9.	*Mirabilis jalapa* L.	Root, fresh	Prostate, Pre-prostate cancer	Oral
10.	*Cynodon dactylon* L.	Stems, dried	Cysts of the ovary, Cysts of the uterus	Oral
11.	*Laccopetalum giganteum*	Leaves, fresh	Fertilization (Heat Ovaries)	Oral
12.	*Cinchona officinalis* L	Bark, dried	Fertility, Sexual potency	Oral
13.	*Cestrum strigilatum* R	Flowers, stem	Control and regulate the menstrual cycle	Oral
14.	*Typha angustifolia* L	Stems, dried	Prostate	Topical
15.	*Pilea microphylla* (L.)	Whole plant,	Prostate, Cysts	Oral
16.	*Lantana scabiosiflora*	Leaves, stem	Cold of the ovaries, Menstruation	Oral

(References: [14], [16], [20], [21])

(Table 1). The botanical names of the plants used to treat male and female reproductive disorders are listed alphabetically by disease. Additionally given are the components used in the drug preparation process, the dosage, and the recommended treatment time. Where accessible (Table 1), information about the other ingredients, if any, is also provided. The use of ethnomedicine as complementary and alternative medicine is growing in popularity despite the absence of scientific validation of the efficacy and safety of medicinal plants. It is also because it is cost-effective and has few side effects [34]. Pharmaceutical firms and scholars have recently concentrated on medicinal plants as a lucrative field. Polycystic ovary syndrome (PCOS), a prevalent and multifaceted endocrinological and metabolic disorder in women, is associated with infertility or subfertility. Initially referred to as the Stein-Leventhal syndrome, PCOS manifests as a severe condition characterized by ovarian enlargement and numerous small, undeveloped follicles [37]. It is a common female disorder with a prevalence rate of 2.2–26% globally and 11.96% among Indian teenagers [13]. Clinical manifestations of PCOS include menstrual irregularities or absence, abdominal obesity, acanthosis nigricans, and signs of androgen excess, such as acne or seborrhea, and insulin intolerance. Over the long term, PCOS increases the risk of endometrial cancer, type 2 diabetes, dyslipidemia, hypertension, and cardiovascular diseases. Notably, endometrial malignancy, cardiovascular disease, dyslipidemia, and type 2 diabetes mellitus are more prevalent in women with PCOS. The pathophysiology of PCOS primarily stems from abnormalities in the hypothalamic-pituitary axis, insulin secretion and action, and ovarian function. Obesity and insulin intolerance are closely linked to PCOS. Elevated insulin levels prompt the ovaries to produce testosterone, leading to anovulation, a significant cause of infertility. An altered luteinizing hormone/follicle-stimulating hormone (LH/FSH) relationship in patients with PCOS, with higher LH levels relative to FSH secretion, leads to increased androgen production by theca cells, resulting in irregular hormonal regulation, higher estrogen levels, erratic menstruation, and infertility [7]. Individuals with PCOS also exhibit an abnormal lipoprotein profile, characterized by elevated plasma triglyceride (TG) levels, slightly increased low-density lipoprotein cholesterol (LDL-C), and reduced high-density lipoprotein cholesterol (HDLC) levels. This lipid profile is often associated with heightened hepatic lipase activity, increased triglyceride content in circulation, insulin resistance, and elevated concentrations of smaller LDL particles. Current treatments for PCOS predominantly involve lifestyle modifications and pharmaceutical interventions. Lifestyle changes include dietary adjustments and supervised exercise to facilitate weight reduction. Pharmaceutical options like oral clomiphene citrate and metformin are employed for PCOS management; however, they may be accompanied by side effects such as nausea, vomiting, and gastrointestinal disturbances [5]. To mitigate these side effects, herbal medications are combined with pharmaceutical treatments to address PCOS symptoms effectively. This study aims to conduct a comprehensive analysis of the phytochemical constituents and bioactivity of medicinal plants and herbal remedies traditionally employed for managing reproductive diseases. The objectives encompass the identification and characterization of these compounds, the assessment of their bioactivity, the execution of comparative analyses to ascertain the most efficacious alternatives, the evaluation of safety and toxicity, the development of standardized formulations, the initiation of clinical trials, and the establishment of usage guidelines. The primary objective of this study is to provide evidence-based healthcare interventions that can improve the overall well-being of individuals impacted by reproductive health conditions.

2 Exploring Medicinal Plants and Herbal Remedies for Managing Reproductive Diseases with a Focus on Polycystic Ovary Syndrome (PCOS)

Polycystic ovarian syndrome (PCOS) is a complex metabolic disorder that significantly impacts the lives of numerous women during their reproductive years. This intricate condition poses challenges and potential implications for long-term health [44, 45]. Polycystic ovary syndrome (PCOS) can present a significant obstacle to a woman's desire to become a mother, as infertility frequently emerges as a prominent clinical manifestation of the condition. Nevertheless, the extensive ramifications of polycystic ovary syndrome (PCOS) transcend reproductive health, significantly impacting the psychosocial welfare of individuals affected by this condition. Polycystic ovary syndrome (PCOS) has attracted considerable attention due to its complex interconnections with other medical conditions. Polycystic ovary syndrome (PCOS) is often linked to diabetes, a metabolic disorder characterized by irregular blood glucose levels. Women diagnosed with PCOS face an increased risk of developing type 2 diabetes, which adds an extra health concern [37, 38].

Furthermore, the prevalence of obesity poses a significant concern in the lives of numerous women affected by polycystic ovary syndrome (PCOS). The presence of hormonal imbalances in this condition frequently leads to increased body weight and challenges in effectively managing weight [44, 45]. Consequently, this phenomenon exacerbates the susceptibility to diabetes and other metabolic complications. Polycystic ovary syndrome (PCOS) has been associated with hypertension, also known as high blood pressure. The co-occurrence of this condition seems to be prevalent, posing difficulties in the holistic management of individuals affected by this syndrome. Moreover, it is worth noting that polycystic ovary syndrome (PCOS) frequently leads to the grave outcome of heart disease, which is recognized as the primary cause of mortality in women.

Polycystic ovary syndrome (PCOS) is characterized by dysregulation of hormones, insulin resistance, and excessive body weight, increasing the likelihood of cardiovascular complications [26]. Consequently, women with PCOS should exercise prudence and vigilance in monitoring their cardiovascular health, emphasizing proactive interventions and adjustments to their daily habits. The range of lipid abnormalities presents an increasingly diverse range of health hazards linked to PCOS. Dyslipidemia, a medical condition characterized by aberrant levels of lipids in the bloodstream, is a common comorbidity in individuals with PCOS [28–30]. Elevated levels of low-density lipoprotein (LDL) cholesterol and triglycerides, in conjunction with diminished levels of high-density lipoprotein (HDL) cholesterol, have been implicated in the pathogenesis of atherosclerosis and the progression of cardiovascular disease. The increased prevalence of lipid abnormalities in individuals with PCOS adds a layer of complexity to the already intricate health profile observed in women affected by this condition. Autoimmune thyroiditis, characterized by chronic thyroid gland inflammation, represents an additional element within the intricate framework of PCOS [31, 32–34]. PCOS demonstrates an increased susceptibility to thyroid disorders, specifically autoimmune thyroiditis, a significant concern. This phenomenon adds to the array of difficulties that need to be tackled in the holistic administration of the syndrome. Maintaining optimal thyroid function is a crucial priority in the pursuit of overall health and well-being. The correlation between PCOS and malignancies exacerbates the overall impact of the condition. While PCOS has no direct causal relationship with cancer, existing evidence indicates a correlation between PCOS and an elevated long-term susceptibility to certain malignancies. Breast cancer, the most common malignancy among women, and endometrial cancer in the uterine lining are two noteworthy and worrisome health hazards [35–38]. The relationship between hormonal imbalances and PCOS is characterized by increased estrogen levels, which appears to contribute to an increased risk of developing cancer. Cancer is a poignant reminder of the importance of timely detection, cancer screenings, and preventive measures for women managing PCOS. The precise etiology of PCOS remains uncertain, highlighting the intricate interaction between genetic and environmental elements. The phenomenon is hypothesized to arise from a complex combination of innate genetic characteristics and external environmental influences. A genetic component in PCOS suggests a familial predisposition, as indicated by the high prevalence of the syndrome among close relatives. However, the activation of latent potential in PCOS is significantly influenced by environmental factors, ultimately resulting in its manifestation. The complex interplay between genetic and environmental factors gives rise to a syndrome that is a multifaceted puzzle that is still not fully comprehended. Extensive research has been undertaken to tackle PCOS's intricate challenges and comprehend, manage, and mitigate its effects. Various management strategies have been developed to improve the quality of life for individuals who self-identify as women and experience the effects of PCOS [39–41]. These strategies encompass various approaches, including adjustments to an individual's lifestyle, pharmaceutical interventions, and alternative therapies. Using medicinal plants has garnered considerable attention as a potential therapeutic approach, offering a holistic and nature-based strategy for managing PCOS. Throughout history, medicinal herbs have played a crucial role in traditional medicine systems, highly esteemed for their therapeutic properties and ability to effectively treat diverse health conditions. Botanical remedies have been employed within PCOS to alleviate the specific symptoms associated with this condition. PCOS has two significant symptoms in women: oligo/amenorrhea and hyperandrogenism. These symptoms have considerable implications for reproductive health and affect individuals' overall physical and mental well-being. Exploring medicinal plants as a potentially effective alternative therapy for PCOS represents a promising avenue for scholarly inquiry. Plants often demonstrate the presence of bioactive compounds that possess therapeutic properties, capable of addressing the hormonal imbalances and metabolic disruptions inherent to PCOS. By incorporating these natural remedies, which have strong roots in historical healing practices, individuals can adopt an integrative methodology to manage the syndrome proficiently. While it is not within the scope of this paragraph to conduct an extensive analysis of individual medicinal herbs and their corresponding properties, it is important to highlight the prevailing inclination toward natural and complementary treatments in the management of PCOS. By embracing these traditional botanical treatments, women diagnosed with PCOS can access various resources to rebalance hormone levels, regulate menstrual cycles, and alleviate the distressing symptoms commonly linked to this condition [42, 43]. To summarize, PCOS is a multifaceted metabolic disorder that substantially impacts women's health in the reproductive-age bracket. The wide-ranging health challenges associated with this phenomenon include diabetes, obesity, hypertension, heart disease, lipid abnormalities, and autoimmune thyroiditis. The ripple effect of this phenomenon extends to these various health conditions. The existence of malignant neoplasms, such as breast and endometrial carcinomas, underscores the severity of this syndrome [44, 45].

3 Unraveling the Enigmatic Nature of PCOS: Traditional Herbal Remedies as a Ray of Hope for Management and Well-Being

The enigmatic etiology of polycystic ovary syndrome (PCOS), intricately influenced by genetic and environmental factors, is a poignant testament to the unresolved enigmas within medical science [14]. Nevertheless, amidst these challenges, there is a glimmer of hope with the emergence of research on managing polycystic ovary syndrome (PCOS) and using medicinal herbs [16]. These traditional remedies, rooted in longstanding customs, offer an alternative approach to managing the complex array of symptoms associated with polycystic ovary syndrome (PCOS), thereby augmenting the overall well-being of individuals affected by this condition [20, 21]. As we navigate the dynamic terrain of PCOS research and treatment, using medicinal plants is a testament to the enduring nature and flexibility of healthcare methodologies across diverse societies and historical periods (Table 1).

4 Compounds from Plants for PCOS

Ecklonia cava: In addition, the administration of *Ecklonia cava* extract resulted in the normalization of various hormone levels, such as testosterone, estrogen, luteinizing hormone (LH), and follicle-stimulating hormone. Moreover, it demonstrated the ability to alleviate anti-Mullerian hormone (AMH) levels. The results of this study indicate that the extract in question has the potential to modulate multiple factors related to the development of ovarian follicles. The histological analysis provided additional evidence to support the assertion that rats administered with

Ecklonia cava extract demonstrated a notable decrease in symptoms associated with polycystic ovary syndrome (PCOS), resembling the characteristics observed in the ovaries of healthy individuals. This well-established natural remedy mitigates the effects of allergies and inflammation [21].

***Glycyrrhiza glabra*:** Glycyrrhiza glabra, commonly utilized in Korean herbal formulas, is recognized for its efficacy in addressing various health conditions such as inflammation, immune system modulation, hepatic failure, spasms, and metabolic disorders, specifically in women. A study conducted in 2018 by Lee et al. examined the impact of an ethanol extract of *Glycyrrhiza glabra* on female Sprague Dawley rat models that displayed symptoms similar to polycystic ovary syndrome (PCOS) induced by letrozole. The experimental group that received a combination of licorice and letrozole demonstrated a marked increase in follicle-stimulating hormone (FSH) recovery and a significantly reduced ratio of luteinizing hormone (LH) to FSH. According to Lee et al. [26], licorice extract demonstrated significant efficacy in mitigating polycystic ovary syndrome (PCOS) symptoms. These symptoms encompassed the thickening of the theca layer, the thinning of the granulosa layer of antral follicles, a decrease in the quantity of antral follicles, and the development of follicular cysts.

***Aegle marmelos*:** The present study investigated the potential antiandrogenic effects of a hydroalcoholic preparation obtained from *Aegle marmelos* in the management of polycystic ovary syndrome (PCOS) induced by letrozole in a female Wistar rat model. The present study investigated the impact of the hydroalcoholic extract derived from *Aegle marmelos* on ovarian histopathology and a range of biochemical and physical parameters. The research findings indicated significant elevations in blood luteinizing hormone (LH) levels and reductions in serum follicle-stimulating hormone (FSH) levels. An increased occurrence of corpus luteum, developing follicles, and oocytes enveloped by granulose cells [17].

***Bougainvillea spectabilis*:** In a 2018 study examining a rat model of polycystic ovary syndrome (PCOS) induced by estradiol valerate (EV), Ebrahim N.A. and colleagues conducted an assessment of the protective potential of *Bougainvillea spectabilis* leaves (BSL) extract on ovarian folliculogenesis. The research revealed that the group treated with estradiol valerate and *Bougainvillea spectabilis* extract exhibited significantly reduced blood levels of LH, estrogen, and glucose while also displaying elevated serum levels of FSH and antioxidants. Furthermore, this group's ovarian cortex featured corpora lutea, preantral, and antral follicles [18].

***Matricaria chamomilla*:** Various studies have explored the potential of natural remedies in alleviating symptoms and complications associated with polycystic ovary syndrome (PCOS), a complex metabolic disorder affecting women. For instance, research by Heidary et al. in 2018 examined the effects of chamomile on lipid and hormonal parameters in reproductive-age PCOS women. The study found oral chamomile capsule administration significantly decreased overall testosterone levels in PCOS women. However, it did not significantly affect dehydroepiandrosterone sulfate levels, LH/FSH ratio, or lipid factors [20].

***Cinnamomum zeylanicum*:** In 2018, Maryam Rafraf and her team conducted a study investigating how cinnamon supplements could affect women with PCOS.

They examined various factors, including blood total antioxidant capacity (TAC), malondialdehyde (MDA), and serum lipids. The women who took cinnamon supplements experienced significant improvements in their serum levels of total cholesterol (TC), low-density cholesterol, and high-density cholesterol. Additionally, the antioxidant capacity of their blood increased, indicating better protection against oxidative stress. They also noticed decreased malondialdehyde levels, a positive sign for their overall health.

***Galega officinalis*:** The potential protective effects of *Galega officinalis* in a rodent model of polycystic ovary syndrome (PCOS) induced by estradiol valerate. The study unveiled several encouraging results. The researchers noted noteworthy decreases in fasting blood sugar, insulin, testosterone, luteinizing hormone (LH), and follicle-stimulating hormone (FSH) concentrations, alongside substantial elevations in serum estrogen and aromatase levels. Additionally, the experimental group that received *Galega officinalis* demonstrated a significant augmentation in both pre-antral and antral follicles, accompanied by a notable reduction in cystic follicles. The results of this study indicate that *Galega officinalis* possesses potential advantages attributed to its antioxidant and insulin-related characteristics, as evidenced in a historical context tracing back to 1190 A.D.

***Moringa oleifera*:** This study investigates the impact of different doses of *Moringa oleifera* leaf extract on a polycystic ovary syndrome (PCOS) model that exhibits insulin resistance. The researchers made noteworthy observations during their investigation. Initially, a conspicuous decline in the accumulation of body weight was observed – a significant augmentation in folliculogenesis in the polycystic ovary syndrome (PCOS) ovary model. Additionally, androgen levels were declining in the cohort that underwent treatment with *Moringa oleifera*.

***Nigella sativa*:** The study encompassed a sample size of ten female participants clinically diagnosed with polycystic ovary syndrome (PCOS) and oligomenorrhea. Following the administration of *Nigella sativa*, noteworthy enhancements were observed in multiple health parameters, encompassing a considerable decrease in serum cholesterol levels, triglycerides, fasting blood sugar, insulin, aspartate aminotransferase (AST), and LH levels.

Vitis: This study investigates the impact of grape seed extract (GSE) on lipid and inflammatory markers in Wistar rats with polycystic ovary syndrome (PCOS) induced by estradiol valerate. The study primarily examined triglyceride (TG), total cholesterol (TC), high-density lipoproteins cholesterol (HDL-C), low-density lipoproteins cholesterol (LDL-C), and interleukin 6 (IL-6). Significantly, the cohort that was administered grape seed extract demonstrated noteworthy decreases in LDL-C, TC, and IL-6 concentrations. Administering specific doses of GSE had a beneficial effect on rats with polycystic ovary syndrome (PCOS). This effect was observed through the mitigation of dyslipidemia and reduction of inflammation, improving the overall systemic symptoms of the rats.

***Bambusa bambos*:** In recent studies, scholars have investigated a range of natural interventions to mitigate the difficulties associated with polycystic ovary syndrome (PCOS). This multifaceted metabolic disorder primarily affects women. The investigations above have produced encouraging results in mitigating particular symptoms and complications linked to polycystic ovary syndrome (PCOS). In a study conducted in 2018, the effects of processed *Nigella sativa* on menstrual irregularities associated with polycystic ovary syndrome (PCOS) were investigated. The findings of this study demonstrated noteworthy enhancements in cholesterol, triglycerides, blood sugar, insulin, AST, and LH levels after the treatment. The potential of grape seed extract (GSE) was examined in order to improve lipid profiles and mitigate inflammation in rats with polycystic ovary syndrome (PCOS). The findings of this investigation revealed favorable outcomes. Furthermore, the study conducted by examined the effects of bamboo seed oil on metabolic symptoms commonly associated with polycystic ovary syndrome (PCOS). This research revealed significantly reduced glucose, cholesterol, and triglyceride levels. The findings above highlight the potential of utilizing natural remedies to alleviate complications associated with polycystic ovary syndrome (PCOS) and improve the overall quality of life for individuals affected by this condition.

***Commiphora wightii*:** A study conducted in 2016 examined the effects of *Commiphora wightii* on hyperandrogenism in a polycystic ovary syndrome (PCOS) model. The findings of this study demonstrated a decrease in morphological abnormalities of ovarian follicles and a restoration of hormone levels to normal. Furthermore, a study conducted in 2015 examined the efficacy of hazelnut oil as a treatment for polycystic ovary syndrome (PCOS) in rats. The findings of this study indicated favorable results, including weight loss, restoration of hormonal equilibrium, and an augmentation in uterine weight. Moreover, a study conducted in 2016 revealed the potential of curcumin in regulating testosterone levels, mitigating insulin resistance, and preventing diabetic complications in rats with polycystic ovary syndrome (PCOS). These studies highlight the potential efficacy of natural remedies, including *Commiphora wightii*, hazelnut oil, and curcumin, in mitigating hormonal imbalances and metabolic disturbances commonly observed in individuals with polycystic ovary syndrome (PCOS) ([16, 24])

***Corylus avellana*:** The study's results indicated a significant reduction in body weight, restoring LH and FSH levels to normal, and increasing uterine weight. Furthermore, the researchers observed a substantial elevation in estrogen and progesterone levels and a decrease in testosterone. These findings highlighted the antioxidant properties of *Corylus avellana* oil and its efficacy in treating PCOS by regulating gonadotropins, steroids, and serum lipid parameters [16].

***Curcumin*:** Curcumin effectively restored serum testosterone levels to normal and successfully elevated progesterone levels, addressing hormonal imbalances associated with PCOS. Notably, curcumin can prevent insulin resistance and diabetic complications when administered orally, as evidenced by its capacity to halt the rise in HbA1c levels. Furthermore, the research revealed that curcumin was successful in eliminating cysts. These findings underscore the potential of curcumin as a promising medication for the treatment of both pathological and clinical abnormalities in PCOS.

Palm pollen: Palm pollen extract reveals reduced LH, estrogen levels, and cystic follicles, coupled with increased FSH, progesterone, and corpus luteum [23]. Similarly, research by Shetty et al. in 2015 found that *Vitex negundo* effectively lowered excessive androgen levels in rats with PCOS, accompanied by decreased glucose and testosterone levels. Additionally, in 2014, Sadrefozalayi et al. explored the renoprotective effects of the aqueous extract of *Foeniculum vulgare* in experimental PCOS rats, observing improvements in serum urea levels and kidney function. These findings underscore the potential of natural remedies, such as palm pollen, *Vitex negundo*, and *Foeniculum vulgare*, in alleviating symptoms and complications associated with PCOS.

Vitex negundo**:** The effects of *Vitex negundo* on female Sprague Dawley rats that had experienced hyperandrogenism due to PCOS. Through daily administration of the hydroalcoholic extract of *Vitex negundo*, they observed a significant reduction in elevated androgen levels. Additionally, the nirgundi extract led to a substantial decrease in serum glucose and testosterone levels. Notably, the group that received the nirgundi extract displayed the lowest incidence of follicular cysts and lesions.

Foeniculum vulgare**:** The research revealed that PCOS-afflicted rats exhibited lower serum urea levels. Notably, the administration of *Foeniculum vulgare* led to significant improvements in Bowman's space and acute tubular necrosis, restoring these parameters to a more normal state.

Allium cepa**:** The influence of an ethanolic extract derived from *Allium cepa* seeds on apoptosis modulation in rats with experimentally induced PCOS. The findings pointed to elevated levels of antioxidant capacity, a reduction in cyst formation, and a decrease in apoptotic granulosa cells, signifying the potential advantages of *Allium cepa* in managing PCOS. In addition, in 2010, Laxmipriya Nampoothiri and her colleagues investigated the efficacy of an Aloe vera gel formulation in a PCOS rat model induced by letrozole. The administration of Aloe vera gel resulted in enhanced ovarian health, the restoration of hormonal balance, and the maintenance of estrus cyclicity, underscoring its protective role against a PCOS phenotype [19].

Aloe barbadensis Mill**:** Aloe vera, scientifically classified as Liliaceae, was the focal point of research conducted by Laxmipriya Nampoothiri et al. in 2010. This study aimed to assess the effectiveness of a specific formulation of Aloe vera gel in a rat model of polycystic ovary syndrome (PCOS) induced by letrozole. Significant results were noted after applying Aloe vera gel, including a lack of weight increase and a decrease in ovarian atretic cysts. In addition, the oral administration of a 1 ml daily dosage of Aloe vera gel formulation for 45 days was crucial in restoring the subjects' estrus cyclicity, improving glucose sensitivity, and altering important steroidogenic activity. As a result, it served as a protective factor against the PCOS phenotype [33].

5 Exploring Natural Remedies for Enhancing Reproductive Health: A Focus on PCOS and Fertility

Polycystic ovary syndrome (PCOS) is a commonly encountered, heterogeneous, endocrinological, and metabolic disorder affecting women of reproductive age, often resulting in infertility or subfertility [14, 26]. Due to their diverse phytoconstituents, medicinal plants have been explored for their potential to manage various ailments, including PCOS [30]. Various herbal extracts following the onset of PCOS have been associated with reduced levels of blood testosterone and LH, alongside elevated blood progesterone and FSH levels [16]. Notably, these treatments have been observed to induce the development of various follicles at different growth phases, encompassing primary, antral, preantral, large oocytes, and corpora lutea in the treatment groups. Research suggests that many herbal extracts exhibit efficacy in treating PCOS, normalizing blood and sex hormone levels, resolving cysts, reducing insulin levels, and ameliorating other PCOS symptoms [21, 22]. Furthermore, some studies have emphasized the safety of these PCOS-targeted plants, attributing their favorable effects to the presence of phytoestrogens [23]. These compounds, characterized as weak estrogen antagonists, tend to exhibit more pronounced estrogenic effects when the body's estrogen levels are low in PCOS patients, rendering them safe for widespread utilization [24]. The medicinal plants discussed in this chapter can potentially enhance fertility through their interactions with the hypothalamic-pituitary-gonadal (HPG) axis and modulation of estrogen receptors (ERs). Additionally, these plants can provide an environment conducive to regulating ovulation, implantation, uterine embryo tolerance, and fetal development. They also show promise in averting reproductive transmitted bacterial, viral, and fungal infections, mitigating inflammatory reactions, hypersensitivity, and autoimmune disorders [2].

Estrogen receptors (ERs) mediate physiological responses to estrogen within specific tissues. While ERs are present in ovarian tissues, bone, and blood vessels, ERs are expressed in breast and uterine tissues. These ERs act as ligand-activated nuclear transcription factors, falling under the category of nuclear hormone receptors. Several plants contain phytoestrogens, which exhibit estrogenic effects in mammals. Notable examples of these substances with a strong affinity for estrogen receptors include formononetin, genistein, daidzein, and biochanin A. It is important to note that the concentration required for induction by these derivatives is significantly higher than anticipated despite their stronger binding to ER compared to ER [8]. These phytoestrogens contribute to the reduction in bone loss by lowering the levels of uric acid deoxypyridinoline. However, they do not impact osteogenic markers such as alkaline phosphatase and osteocalcin. Additionally, their vasoconstrictive properties make them beneficial in treating menopausal symptoms, such as reducing hot flashes, vaginismus, and dyspareunia [12]. Furthermore, bioactive compounds present in medicinal plants, including flavonoids and isoflavones, exhibit the potential to improve lipid profiles by reducing triglycerides and LDL cholesterol while increasing HDL cholesterol, which is crucial for reproductive health. Moreover, numerous studies have demonstrated that plants rich in polyphenols can impede the development of breast tumors by blocking pathways like IGF-1 (insulin-like growth factor 1)/P13K/Akt and ERK1/2 MAPK-Bax. Research into the effects of plant polyphenols, such as isoflavones, on the skin has shown that these compounds enhance the synthesis of hydroxyproline, a marker of collagen and elastic fiber synthesis, leading to vasodilation vascular endothelial growth factor (VEGF) in cutaneous blood vessels, regulation of sweat and sebaceous gland secretion, and control of collagen synthesis in the growth of hair layers, particularly in the context of menopause and infertility-related symptoms.

Punica granatum **(Pomegranate):** Pomegranates, identified by their scientific name *Punica granatum*, have garnered significant attention and are cultivated across various geographical areas, including Asia, the Middle East, and the Mediterranean [31]. Pomegranates possess abundant vital constituents, encompassing vitamin C, water, and flavonoids, namely anthocyanins, punicalagin, ellagic acid, and gallic acid. The pomegranate seeds contain phytoestrogens of significance, such as genistein, daidzein, coumestrol, and glutamic and aspartic acids [9]. Significantly, the utilization of pomegranate extract, containing these valuable phytoestrogens, has demonstrated the ability to regulate and alleviate symptoms commonly associated with polycystic ovary syndrome (PCOS) in animal studies involving rats affected by PCOS. The botanical extract in question plays a role in the augmentation of uterine wall thickness and the stimulation of mucus secretion by facilitating increased uterine blood flow through vasodilation. The increased production of mucosal secretions, facilitated by anti-inflammatory mechanisms, has been linked to a higher successful implantation rate. Mohammadzadeh et al. [32] conducted a rigorous clinical trial employing a triple-blind, randomized, controlled design, which involved a sample of 110 women who were in good health. The study yielded a noteworthy finding. The researchers discovered that the presence of calcium and tannins in pomegranate peel was associated with an enhancement in sexual satisfaction among women and a simultaneous reduction in the symptoms of inflammation and infection in their reproductive canal. Furthermore, a comprehensive examination of diverse human cell lines, such as ovarian (SKOV3), cervical (SiHa, HeLa), endometrial (HEC-1A), breast (MCF-7, MDA MB-231), and abnormal breast fibroblast (MCF-10A) cells, has unveiled the noteworthy characteristics of pomegranate extract as a selective estrogen receptor modulator (SERM). The observed effect of this activity can be attributed to its capacity to interact with estrogen receptors (ERs), suppressing cell line proliferation in laboratory and animal models, specifically in mice undergoing ovariectomy. Additionally, the study conducted a randomized controlled, triple-blind parallel trial to investigate the effects of pomegranate fruit extract on testosterone levels in the serum of 23 women diagnosed with polycystic ovary syndrome (PCOS). The findings revealed that the administration of pomegranate fruit extract reduced testosterone levels, improving the participants' lipid profile. Furthermore, a research study conducted on rats with polycystic ovary syndrome (PCOS) found that administering pomegranate fruit extract increased serum estrogen levels and a simultaneous improvement in related symptoms. The study reported significant findings after 81 days [22].

Matricaria chamomilla **(Chamomile):** *Matricaria chamomilla*, commonly known as chamomile, is a member of the chicory family and possesses a range of beneficial compounds, including flavonoids and antioxidants such as apigenin, choline, camelina, farnesene, matricin, and gallic acid. Numerous studies have demonstrated that chamomile extracts can substantially impact various physiological processes. The investigation of the growth and maturation of isolated mouse ovarian follicles within a three-dimensional culture system revealed the significant contribution of chamomile extracts. The extracts above exhibited the ability to enhance progesterone, 17-estradiol, and dehydroepiandrosterone levels in the culture medium while mitigating oxidative stress and reducing indicators of follicular diameter and antrum formation. Furthermore, the influence of chamomile resulted in an extended duration of oocyte survival. Applying chamomile extract has also exhibited the capacity to augment estrogen-dependent sexual characteristics in mice undergoing gonadectomy. The phenomenon above can be observed in facilitating modifications such as enhanced hair growth, body temperature fluctuations, and managing the menstrual cycle. Conducted a double-blinded clinical trial with a sample size of 80 postpartum pregnant women, all of whom had a gestational age of 40 weeks or more. The researchers observed that the administration of chamomile extract-containing capsules for 1 week resulted in a facilitation of labor onset. Furthermore, it is worth noting that this particular intervention resulted in a decreased duration of labor compared to the control group. The effects of chamomile plant extract on lactation have been elucidated through human research. According to it was observed that the administration of chamomile plant extract exhibited the potential to induce lactogenesis in women who were lactating. The observed mechanism can be attributed to the interaction between chamomile and dopamine receptors, which promotes galacta production. Furthermore, conducted a pilot randomized trial with a sample size of 56 women diagnosed with idiopathic hyperprolactinemia. The study findings suggest that chamomile might potentially play a role in regulating prolactin secretion in women. The findings of this study indicate that female participants who received a dosage of 5 ml of chamomile syrup twice daily experienced a reduction in prolactin levels after 4 weeks, as opposed to the group that received a placebo. In addition, the aroma of chamomile has been linked to increased intensity of uterine contractions during labor, as demonstrated in a controlled trial that included a sample of 130 female participants. Chamomile extract has the potential to provide supplementary advantages in comparison to chemical medications, such as mefenamic acid and nonsteroidal anti-inflammatory drugs (NSAIDs), in the prevention of postpartum pain among women. The inhibitory effect on COX-2 has been attributed to this phenomenon.

Vitex agnus-castus (Verbenaceae): Historically, *Vitex agnus-castus*, a plant belonging to the Verbenaceae family, has been employed for the management of acne and various menstrual disorders associated with corpus luteum insufficiency, including spasmodic dysmenorrhea, premenstrual symptoms, certain menopausal conditions, and insufficient lactation. The analysis of Verbenaceae plant extracts using liquid chromatography-electrospray ionization/mass spectrometry (LC-ESI/MS) confirmed the presence of various compounds. These compounds include orientin, catechin, rutin, rosmarinic acid glycoside, quercetagetin trimethyl ether, biochanin A, genistein, syringetin C glycoside, agnuside, kaempferol-7-*O*-glucuronide, luteolin-7-*O*-glucoside, homorientin, and isovitexin. Most of these compounds are isoflavones and flavonoids, which benefit women's reproductive health due to their strong binding affinity for estrogen ERs. The plant's flavones have been found to exert an inhibitory effect on the release of prolactin and FSH hormones by modulating the hypothalamic-pituitary-gonadal (HPG) axis. Additionally, its flavonoids have been shown to enhance the release of nitric oxide (NO) and cyclic guanosine monophosphate (cGMP) from vascular endothelial cells, thereby promoting increased blood flow to the endometrium ([4]. Approximately one in six couples is affected by the condition of infertility. When a couple cannot achieve pregnancy after 1 year, they are clinically diagnosed with infertility. The term "female infertility" describes situations in which the female partner is identified as the primary cause of infertility. Approximately 50% of infertility cases can be attributed to factors associated with female infertility, with approximately one-third of all cases solely attributed to female infertility. The term "unexplained sterility" is commonly employed in the context of reproductive processes. The term "unexplained infertility" describes cases where no identifiable cause for the inability to conceive has been determined. In general, the outcomes become apparent following the completion of all available tests by a couple. According to Beal [10], approximately 25% of couples experiencing infertility are diagnosed with unexplained infertility. The topic of discussion pertains to the issue of female infertility. The topic under discussion pertains to signs. Alterations in the menstrual cycle and ovulatory patterns among females can potentially indicate a medical condition associated with impaired fertility. One of the signs that can be observed is the presence of unusual menstrual cycles. Variations in menstrual patterns: bleeding that deviates from the typical flow in increased or decreased intensity. The duration between consecutive menstrual cycles fluctuates every month. The individual experiences recurring episodes of pain. The occurrence of cramps, pelvic discomfort, and back pain is possible. In certain instances, hormonal imbalances may contribute to infertility among women. In this particular scenario, it is plausible that supplementary indicators may be present. In addition to alterations in sexual drive and longing, according to Smith et al. [44], individuals may experience various skin alterations such as heightened acne, weight gain, hair loss or thinning, and the emergence of dark hair on the chin, torso, and lips. The diagnosis of female infertility refers to identifying and assessing factors contributing to a woman's inability to conceive or carry a pregnancy to term. The female individual and her significant other must undergo diagnostic examinations as a component of the inquiry into potential infertility. The woman has the potential to undergo the subsequent examinations: comprehensive physical examination, encompassing a thorough review of the patient's medical history. Laparoscopy, a minimally invasive surgical procedure involving inserting a specialized instrument through a small incision in the abdominal region, is employed to examine the reproductive organs. Additionally, blood tests are conducted to assess the levels of hormones associated with ovulation, while ultrasound scans are employed to detect the presence of fibroids. According to Lloyd and Hornsby [33], infertility can be attributed to various factors, including an underlying medical condition that adversely affects the fallopian tubes, inhibits ovulation, or disrupts hormonal balance. The medical conditions include endometriosis, polycystic ovarian syndrome, premature ovarian failure, pelvic inflammatory disease, uterine tumors, and polycystic ovary syndrome. Addressing any preexisting medical conditions that may contribute to reproductive challenges is imperative before initiating infertility treatment. Various treatment options can be considered if fertility restoration does not occur. The topic of interest pertains to the relationship between plants and the process of conception. Herbal medicines have historically been employed in the treatment of fertility issues. Historical records indicate that using herbal remedies to enhance male and female fertility dates back to approximately 200 A.D. The herbal fertility treatments encompass distinct botanical species and their corresponding extracts, which are believed to have advantageous effects on the reproductive system, hormonal equilibrium, and sexual drive. Both individuals seeking to enhance their chances of conception and couples experiencing fertility challenges utilize these medications. According to Agha-Hosseini et al. [1], herbal reproductive treatments have demonstrated potential in addressing hormonal imbalances, irregular menstrual cycles, erectile dysfunction, and impaired sperm motility. Throughout human history, individuals across various cultures and regions have explored and used herbal medicine for countless centuries. Infertility treatment is becoming more prevalent in Western societies among males and females. Nevertheless, the American Society for Reproductive Medicine asserts that there is limited scientific substantiation for the notion that herbal remedies can enhance fertility. Nevertheless, it is possible to provide credible evidence by utilizing evidence-based herbal medicine, specifically through clinical trials [11]. The emotional impact of infertility is well understood by women who undergo this condition. The conditions above encompass anxiety, isolation, prolonged depressive states, and difficulties concentrating on routine activities. Many infertility women may initiate their treatment by considering in vitro fertilization (IVF) techniques. Nevertheless, implementing these techniques incurs significant costs, rendering them financially inaccessible for certain women. Various natural and herbal remedies have been identified as potential interventions that may contribute to addressing the root causes of infertility and enhancing the likelihood of successful conception. According to Akhondzadeh et al. [3], incorporating a nutritious diet and engaging in consistent physical activity are lifestyle factors that can yield positive outcomes.

Ashwagandha: Ashwagandha, scientifically referred to as *Withania somnifera*, is an herbal remedy recognized as Indian ginseng. It has been observed to offer notable advantages for females encountering difficulties conceiving. This botanical remedy effectively promotes optimal functioning of the reproductive organs and helps maintain hormonal balance. Pomegranate has been found to possess properties that contribute to the toning of the endometrium in individuals who experience recurrent miscarriages. Pomegranate has been found to enhance female fecundity. This intervention facilitates the enhancement of uterine blood circulation and the thickening of the uterine lining, thereby reducing the likelihood of experiencing a miscarriage. Furthermore, it supports the optimal development of the fetus [15].

Cinnamon: Cinnamon has been found to promote healthy ovarian function, thereby potentially mitigating sterility. This therapeutic effect is associated with the potential to derive five distinct benefits from cinnamon consumption. Female infertility is a prominent factor contributing to infertility in individuals diagnosed with polycystic ovary syndrome (PCOS). According to a study published in the *Fertility and Sterility* journal in 2007, including cinnamon in the diet has been shown to potentially improve the regularity of menstrual cycles in individuals with polycystic ovary syndrome (PCOS). Additionally, it encompasses various factors that can hinder a woman's reproductive capacity, such as endometriosis, uterine fibroids, and amenorrhea, characterized by the absence of menstrual periods. Furthermore, it has been suggested that cinnamon possesses potential benefits in preventing yeast infections.

Chasteberry: Chasteberry, scientifically referred to as Vitex has been identified as an effective remedy for addressing infertility caused by hormonal imbalances within the body. The herb's ability to enhance ovulation is attributed to its elevated prolactin levels. Additionally, it combats polycystic ovary syndrome (PCOS).

Dates: The consumption of dates has been associated with potential enhancements in fertility due to the presence of various beneficial nutrients. According to these substances possess a rich concentration of essential nutrients such as vitamins A, E, D, and B, as well as iron and other minerals that are crucial for facilitating a woman's ability to conceive and successfully carry a pregnancy to full term. The maca root is a highly effective botanical remedy that has demonstrated efficacy in addressing both male and female infertility. This botanical specimen facilitates the synthesis of hormonally balanced substances and confers particular benefits to females afflicted with hypothyroidism due to its ability to enhance thyroid functionality. Moreover, it serves as a noteworthy reservoir of diverse nutrients that enhance fertility.

6 Ovarian Cancer and Its Prevention Through Herbal Medicines

Ovarian cancer (OC) is a prevalent form of cancer that affects a significant number of women annually, accounting for approximately 244,000 cases worldwide. This represents approximately 2% of all reported cancer cases globally. Nevertheless, obsessive-compulsive disorder (OC) exhibits notable variations across different geographical areas. In 2017, Fiji exhibited the highest prevalence of OC, with an estimated rate of 15 cases per 100,000 females. In contrast, China and specific regions of Africa reported a considerably lower incidence, with only four cases per 100,000 females. The incidence rate of ovarian cancer in women is approximately 1 in 70. Regrettably, when OC is concomitant with other gynecological malignancies, it emerges as the primary contributor to cancer-related mortality, leading to approximately 150,000 deaths globally annually. The elevated mortality rate can be ascribed to delayed detection, as symptoms frequently remain undetectable during the early stages and only become apparent during stages III and IV. Various therapeutic modalities have been developed to impede the dissemination of cancer cells, encompassing chemotherapy, laser therapy, radiation, gene therapy, hyperthermia, and surgical interventions. Medical interventions encompass a multifaceted approach, incorporating radiation therapy, chemical treatments, and surgical procedures. Although these methods possess certain benefits, it is essential to acknowledge their inherent limitations and drawbacks. Therefore, the scientific community is currently working to develop a more efficient treatment to tackle the obstacles presented by ovarian cancer.

Previous generations have used medicinal plants to address various human afflictions, including cancer treatment. Numerous botanical species have demonstrated various pharmacological attributes, encompassing antioxidative, antimicrobial, anticancer, and antidiabetic properties. One notable advantage associated with the utilization of plants in the field of medicine lies in their extensive collection of diverse phytochemicals, which possess the ability to specifically address a wide range of medical conditions. Searching for novel pharmaceuticals to combat cancer is contingent mainly upon identifying biologically significant phytochemicals [41]. Using biomolecules derived from plants has become a well-regarded and promising approach with considerable potential. Significantly, there has been a notable increase in the incorporation of pharmacologically beneficial botanicals in the process of pharmaceutical advancement during recent decades. Considerable research efforts have been undertaken over the past two decades to investigate the potential of natural products in enhancing the efficacy of cancer treatment, with a particular focus on numerous countries.

7 Other Therapeutic Plants' Ability to Prevent Ovarian Cancer

Africa is home to various indigenous medicinal plants traditionally employed for therapeutic purposes. Some of these plants include *Aframomum arundinaceum*, *Aframomum alboviolaceum*, *Aframomum kayserianum, Aframomum polyanthum*, *Echinops giganteus, Xylopia aethiopica, Piper capense*, and *Imperata cylindrica. Additionally, Gladiolus quartinianus, Vepris soyauxii [*25*]*, *Polygonum limbatum, Polyscias fulva, Beilschmiedia acuta, Crinum zeylanicum*, *Dioscorea bulbifera, Elaoephorbia drupifera, Solanum aculeastrum, Albizia schimperiana, Zanthoxylum gilletii*, and *Strychnos usambarensis* have demonstrated their efficacy in the treatment and management of various malignancies, including cancer [16]. The observed plants have demonstrated a notable cytotoxic impact, particularly in regions with a high cancer incidence, and have exhibited resistance to pharmaceutical interventions. As an illustration, in the context of in vitro investigations involving Korean medicinal plants to examine their potential anticancer properties, it was observed that the ethyl acetate fraction derived from the methanolic extract of *Lespedeza cuneata* exhibited a noteworthy cytotoxic impact on A2780 human ovarian carcinoma cells. The IC50 value, indicating the concentration required to inhibit 50% cell growth, was determined to be 77.25 ± 2.05 μg/mL. Similarly, the compound known as (+)-9′-*O*-(α-l-rhamnopyranosyl) lyoniresinol, derived from this particular plant, demonstrated in vitro antiproliferative activity against A2780 cells, with an IC50 value of 77.24 ± 2.05 μM. Significantly, a study involving athymic mice and human SKOV3 ovarian cancer xenografts observed that the tea seeds (*Camellia sinensis*), known to contain saponins, exhibited cancer chemopreventive effects. In addition, it has been observed that lysophosphatidic acid (LPA), a biologically active lipid, can enhance the invasive properties of cancer cells and promote their migration. This effect is accompanied by the phosphorylation of STAT3, which triggers the secretion of interleukin-6 (IL-6) and interleukin-8 (IL-8). Curcumin, a polyphenolic compound derived from the plant species *Curcuma longa*, possesses a range of curcuminoids and exhibits potential therapeutic efficacy in ovarian cancer. It is worth noting that traditional practices in various regions of Nigeria have employed various plant species, such as *Kigelia africana*, *Pistia stratiotes*, *Chenopodium africanum*, *Nymphaea lotus*, *Parquetina nigrescens*, *Nicotiana tabacum*, Nigrescentongensis, *Elaeis guineensis*, *Piper guineense*, *Aframomum melegueta*, and *Petiveria alliacea*, for the treatment of cancer, including ovarian cancer. In particular, *Securidaca longipedunculata* has gained recognition as an effective remedy for ovarian cancer [42]. Although there have been dedicated studies on the Ijebu people, an ethnic group within the Yoruba community, similar practices have been observed in various regions, including Ogun State in northwest Nigeria.

8 Conclusion

This evaluation examines the phytochemical constituents and metabolites in medicinal plants and herbal remedies utilized to treat and control reproductive ailments, specifically emphasizing conditions such as polycystic ovary syndrome (PCOS) and ovarian cancer. This analysis underscores the considerable potential of plant-based therapies in advancing women's reproductive health. This study examines various medicinal plants and compounds, such as *Ecklonia cava*, *Glycyrrhiza glabra*, and *Punica granatum*, and their potential to alleviate reproductive diseases and prevent ovarian cancer. These substances demonstrate promising properties in this regard. The complex nature of polycystic ovary syndrome (PCOS) and ovarian cancer necessitates a comprehensive approach to both treatment and prevention. These herbal remedies can alleviate the symptoms associated with these conditions and tackle the root causes, thereby providing a natural and complementary alternative to conventional medical interventions. Furthermore, this study elucidates the potential therapeutic efficacy of less prevalent botanicals such as *Aegle marmelos*, *Bambusa bambos*, and *Corylus avellana*, which have historically been employed in various regions across the globe. The assessment above highlights the significance of ongoing research on the effectiveness and safety of these botanical treatments. Scientific validation and clinical trials are crucial in establishing the optimal dosages, potential adverse effects, and potential interactions with other medications. This will assist healthcare professionals in making well-informed decisions and providing recommendations to patients who are seeking alternative treatment options. Moreover, it is imperative to underscore that herbal remedies should not be regarded as substitutes for conventional medical interventions but as adjunctive modalities. Patients should seek guidance from healthcare professionals and herbalists to develop personalized treatment strategies, considering their unique circumstances and requirements. Within women's reproductive health, investigating botanical remedies and their constituents holds considerable potential for forthcoming scholarly inquiry and practical implementation. As further knowledge is acquired regarding these therapeutic interventions, their incorporation into holistic healthcare approaches can enhance treatment efficacy and improve the overall well-being of individuals grappling with reproductive disorders and ovarian malignancies. This assessment incentivizes the broader medical and scientific community to engage in collaborative efforts, conduct further research on these botanical agents, and advocate for their responsible utilization in treating and preventing reproductive diseases.

Acknowledgments We would like to extend our sincere appreciation and gratitude to the Department of Agronomy at the School of Agriculture at Lovely Professional University, Punjab, 144411, India.

S. C. Izah et al. (eds.), *Herbal Medicine Phytochemistry*, Reference Series in Phytochemistry, https://doi.org/10.1007/978-3-031-43199-9_21

Abstract

The most significant organ present in the human body is the skin. It helps in protecting the body from different microbial organisms. Skin also helps regulate body temperature and enables one to sense touch, heat, and cold. A variety of skin diseases are widespread and frequently occurring health problems that affect people of all ages, from newborns to elders. These diseases can cause harm in several different ways. It is essential to maintain healthy skin to maintain a healthy body. People can suffer from various skin diseases that affect their skin, causing skin cancer, herpes, cellulitis, acne, and eczema. Many wild plants and their parts having medicinal properties are widely available. Those plants are frequently applied to treat these diseases and their symptoms. Plants have been used by humanity since the beginning of time. In addition to being cheap, natural treatments are also claimed to be safe. The raw material can also be used to produce novel synthetic agents, as it is suitable for this purpose. In this chapter, you will find a review of some plants that can be used to treat skin diseases and different symptoms produced due to these diseases and a summary of the recent technological advancements in this area during the past few years.

1 Introduction

Since immemorial times, a wide range of plants of medicinal value have been utilized as a medicine to treat different diseases. More attention has been gained due to their remedial effects [1]. Other traditional herbs from various habitats can be a new strategy to protect against skin infections. The antimicrobial properties of those plants are now in demand due to their remedial properties. Due to a lack of awareness regarding phytomedicines and deforestation, the value of medicinal herbs is declining. These modern medicines come with many challenges, creating side impacts and toxicity [2]. Mother Nature has provided us with many herbal plants contributing to the health care system. These plant-based medicines are beneficial against various diseases and disorders. Due to lower side effects, there has been an increase in the adaptability and acceptability of these phytomedicines in the recent era [3]. The plants having herbal remedies are efficacious against various skin disorders, skin cancers, eczema, fungal and bacterial infections, acne, etc. [4]

Human skin is considered the largest organ of the human body and is the first defense line to protect the body from many diseases and disorders. Skin disorders occur worldwide, affect all age groups, and present a significant health burden in developed and developing countries. Healthy skin can only be achieved through the use of herbal medicines. The demand for herbal medicines is increasing progressively every day due to their low price and the hazardous effects of modern medications. These medicines have gained a vital contribution to health care [5] due to the presence of various bioactive components like glycosides, tannins, alcohols, aldehydes, etc. Different therapeutic agents can be discovered from these bioactive components and be a future general asset. Cosmetics have also been prepared to look beautiful. In the olden days, many homemade remedies were prepared with different plants and their parts, like banana, neem, sugar beet, *aloe vera*, saffron, papaya, carrot, neem, tulsi, marigold, etc. All these plants are used as medicinal herbs and various homemade remedies to manage different skin diseases. Polyherbal formulations, plant extracts, powders, oils, face packs, soaps, etc., can be prepared with these herbs. People use various synthetic products as cosmetics, but these products may lead to side effects such as skin reactions, inflammations, swellings, irritations, etc., use herbal skin products that are safe for the skin to avoid various side effects and allergies. Various synthetic products are used for oily and dry skin, but those products are not up to the mark. However, the homemade herbal remedies used in different combinations had a marked effect when applied on the skin with few side effects. Dental care products and perfumes also come under cosmetics to prevent tooth decay and body odor. There are different types of skin: oily skin and dry skin. Applying facewash, lotion, and sunscreen for protection from UV radiation and using moisturizing creams for cold climates. All these skin care products should be of herbal origin for better care. Among young stars, acne is the biggest problem that spoils most people's look, appearance, and beauty. It happens due to access sebum secretion, which increases oils in the skin. This can be treated with acne-treating products using gels and creams.

Due to stress and anxiety, many youngsters face aging experiences, which can be prevented by applying herbal skin care products and taking good care of their mental health. Anti-aging helps skin firmness and smoothness, improving brightening and a young appearance.

With the help of various herbal preparations containing fruit pulp extracts, blackheads and black spots can be cleared as these products supply a good amount of antioxidants, which helps give a toned skin. Herbal plants also help brighten skin and provide a good look, enhancing the complexities of the skin and giving it a shiny appearance. Many people face skin dehydration, which ultimately dries up, and the skin is subject to peeling. Various herbal cosmetics preparations can be applied to the skin to increase its moisturizing capacity.

Hair fall has become a significant problem for many people due to dandruff. Most men are facing such issues. So, protecting the hair from dandruff is very important to prevent baldness. The application of herbal anti-dandruff shampoo can do this. Various hair oils can also be provided to control hair fall. Growing hair follicles on the face and all over the body is a significant problem many women face. This can be overcome by applying various herbal preparations to prevent hair growth [6]. The focus of this chapter is to assess the role of phytomedicine in skin infection management.

2 Skin Layers and Their Functions

Skin is an organ of tissues that work together to perform unique and critical functions that provide overall protection. The skin consists of multiple layers, of which epidermal tissue is the most superficial layer attached to the dermis and external to the hypodermis. The epidermal layer is keratinized and protects the skin cells. The dermis is the vascular layer that provides flexible tissues. Additionally, it comprises several connective tissues, sweat glands, hair follicles, and connective tissues and helps provide support and flexibility to the tissues. It also helps to regulate body temperature and provides physical protection against injury. It is a barrier against the external environment, preventing the entry of bacteria and other harmful substances. The innermost layer of the hypodermis is one of the body's most vascularized layers, consisting of loose connective tissues that serve as energy reserves and maintain the body's temperature (Fig. 1). It also contains sweat glands, hair follicles, and oil glands. The hypodermis also plays a vital role in the body's immune system by providing a physical barrier to keep out infectious agents.

Absorption of the drug using the skin is a route through which the drug enters the skin. Drug absorption depends on factors like concentration, time duration, medicine stability, skin condition, and body part exposure. Skin absorption is the transport of chemicals using the skin's outer surface as well as into the circulation. While transporting herbal medication into the dermal region for the treatment of skin diseases, a series of steps are involved in releasing herbal medicines in the dosage form. These steps include formulating the dosage forms, selecting the appropriate delivery system, and ensuring the release of the medicine at the desired rate. Additionally, the stability and safety of the drug must be considered to provide the highest quality of treatment. After a therapeutic photothermal constituent penetrates through the epidermal layer of the skin, it diffuses into the dermal region of the body. The light energy then activates the photothermal branch and produces photothermal effects, leading to the desired therapeutic outcome. The photothermal effects can be monitored and controlled by modulation of light energy. As soon as the herbal constituent reaches the circulation system, it is absorbed by the body. Figure 2 below depicts a graph illustrating how drugs penetrate the body. The drug is then

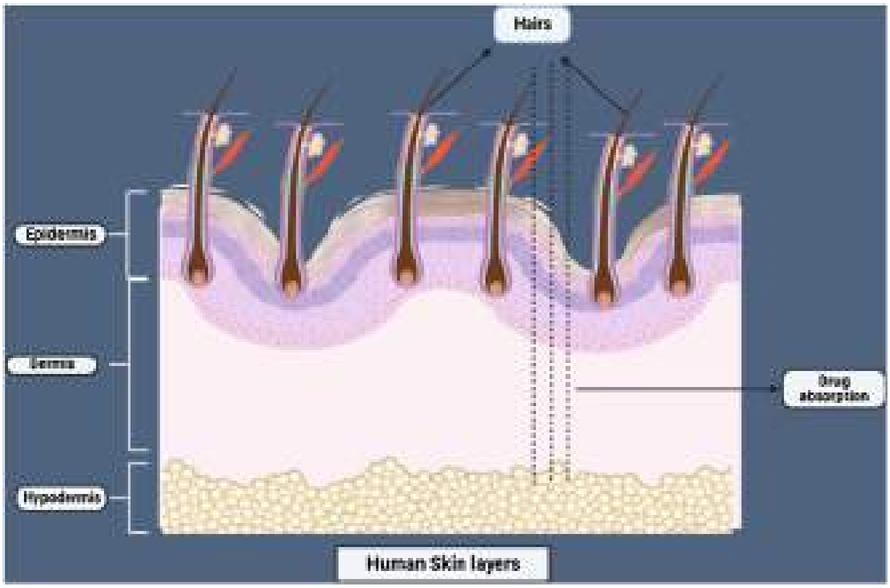

Fig. 1 Drug absorption through the skin that transport the chemicals through outer surface of the skin and through blood circulation

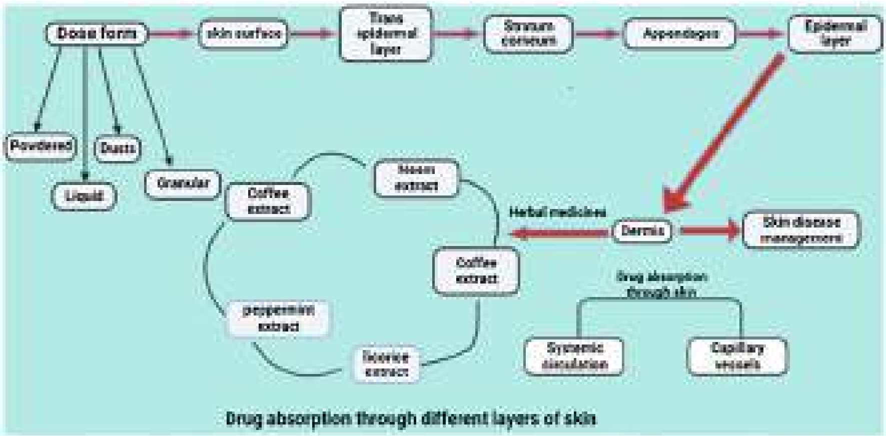

Fig. 2 Drug absorption through different layers of skin, by means of systemic circulation and capillary vessels

distributed through the body, achieving the desired therapeutic effect. The light energy can then be turned off, ending the photothermal effect. The drug is then metabolized and eliminated from the body.

3 Diverse Skin Conditions and Diseases: Characteristics, Effects, and Pathogen Involvement

3.1 Skin Disease

It includes various types of conditions that create irritation or inflame in the skin. Skin diseases also cause rashes or other changes in skin appearance. All the skin diseases mentioned below are not due to pathogens. The list of pathogens occurring in skin diseases is mentioned in Table 1. Various skin conditions can affect individuals, each with distinct characteristics and effects. These conditions include acne, characterized by oil clogging in skin follicles and the formation of bacteria and dead skin in pores; alopecia areata, which leads to hair loss in small patches; atopic dermatitis (eczema), causing itchy skin, dryness, swelling, and cracking; psoriasis, resulting in scaly, swollen, and hot skin; Raynaud's phenomenon, involving periodic reduced blood flow in fingers, toes, and other body parts with associated changes in skin color and numbness; rosacea, typically presenting with thickened skin and pimples on the face; skin cancer, marked by uncontrolled abnormal development of skin cells; vitiligo, leading to pigment loss in skin patches; prurigo, causing itchy skin when exposed to the sun; argyria, involving changes in skin color as the body accumulates a silvery buildup; chromhidrosis, a pigmentation disorder; epidermolysis bullosa, a connective tissue-related disorder resulting in fragile skin prone to blisters and tears; Harlequin ichthyosis, characterized by the presence of thick, hard patches on the skin at birth;

Table 1 List of pathogens causing skin infections

Pathoges	Skin infections	References
Bacterial pathogens		
Propionibacterium acnes	Acne, dendruss, psoriasis, and blepharitis	[9]
Microsporum audouinii., Trichophytion spp.	Tinea capitis	[87]
Staphylococcus aureus	Atopic dermatitis and skin and soft tissue infections	[9]
Fungi		
Malassezia dermatis, M. furfur, M. globose, M. japonica, M. obtuse, M. restricta, M. slooffiae, M. sympodialis, and M. yamatoensis	Tinea versicolor, psoriasis, and atopic dermatitis	[88]

lamellar ichthyosis, which leads to the development of a waxy skin layer, revealing scaly and red skin; and necrobiosis lipoidica, a condition where rashes on the lower legs may progress to ulcers.

3.2 Cause of Skin Disease

Certain lifestyle factors for developing skin disease include (a) trapping of bacteria in the hair follicles or pores, (b) sun rays, (c) viruses, (d) parasites on the skin, e.g., any conditions affecting a person's immune system, (e) certain medicines, bowel infections, (f) kidney diseases, (g) thyroid problems, (h) diabetes, etc.

3.3 Diagnosis of Skin Disease

Medical professionals employ various diagnostic methods to assess skin conditions. These methods include performing a biopsy to examine a small-skin sample under a microscope, conducting a culture to identify the presence of fungi, bacteria, or viruses on the skin, administering a skin patch test to detect allergic reactions to chemicals, utilizing a Wood's light test involving UV light to examine the skin, employing diascopy to assess skin patches by applying pressure with a microscope, using dermoscopy for inspecting skin lesions and conducting a Tzanck test to examine fluid from a blister (Fig. 3).

3.4 Various Skin Diseases Caused by Pathogens

Table 1 presents the list of pathogens causing skin infections

3.4.1 Bacterial Infections

The skin's external surface is mainly affected by bacteria. Skin acts as a medium for bacterial growth. It also allows commensal bacteria to grow on the skin to protect it

Fig. 3 Methods for diagnosing skin disease

from disease-causing bacteria. Some gram-positive bacteria like corynebacterium, staphylococcus, micrococcus, and streptococcus are notorious bacterial pathogens for the skin. A pathogenicbacteria allows bacteria to adhere, grow, and invade the skin's surface. With an increase in bacteria, disruption of the integumentary barrier, invasion by these colonizing bacteria emanates, and skin and soft tissue infections develop.

3.4.2 Viral Infections

It is believed that viruses can penetrate the stratum corneum, which is the top layer of the skin and is susceptible to infection. The stratum corneum is a natural barrier to illness, but viruses can pass through the skin, leading to disease. Viruses can also be transmitted through contact with contaminated surfaces or objects. Therefore, it is essential to take precautions such as washing your hands often and avoiding contact with people who are sick. As well as infecting the epidermis, it also infects the subcutaneous layer. To prevent infection, avoiding touching your face is essential, as this is an easy way for viruses to enter your body. Additionally, it is necessary to regularly clean and disinfect surfaces and objects that are frequently touched. There are a variety of viral skin infections, such as measles, warts, chickenpox, etc., which are not healable by antibiotics [7]. Therefore, practicing good hygiene and wearing protective clothing is essential to avoid contracting the virus. Vaccination is another effective way to reduce the risk of viral skin infections.

3.4.3 Fungal Infections

Fungal infection occurs in the depth of the skin tissue. But sometimes, the conditions may occur superficially, like skin, nails, or hair, called athlete's foot infection or ringworm infection, where trial antibiotics are needed to be taken, which in the long-term cause severe disorders [7].

3.4.4 Tumors and Skin Cancers

The lack of melanin causes skin cancer, which ensues in vitiligo, an auto-immune disorder. The scarcity of melanin cells causes albinism, which may cause skin cancer when exposed to UV radiation. If detected, there is a chance for the survival of patients. [7].

3.4.5 Skin Pigmentation

With the increase in the melanin content of the body, hyperpigmentation occurs, which causes skin irritation and premature aging [7].

Trauma: The burns, cuts, or skin injury leads to a pathogenic attack known as trauma [7].

3.4.6 Rashes

Inflamed-skin conditions can cause pain, itching, and discomfort, leading to scarring and psychological distress. Treatment of such conditions can include topical medications, antibiotics, and lifestyle changes. It is essential to seek professional medical advice when dealing with skin inflammation.

3.4.7 Psoriasis

Infections such as psoriasis that affect the skin can harm the patient's quality of life and negatively affect the patient's outlook on life. Having psoriasis can be physically and emotionally draining. Symptoms can be uncomfortable and embarrassing; flare-ups can cause pain, itchiness, and inflammation. These symptoms can interfere with everyday activities and make it difficult for the patient to enjoy their life. Excessive proliferation of the skin can result from either hereditary factors or hyperproliferation of the skin. Psoriasis is an autoimmune disorder that causes the body to mistakenly attack healthy skin cells, resulting in a rapid overproduction of skin cells that accumulate on the skin's surface. This leads to the characteristic red, scaly patches of psoriasis. In addition, psoriasis can lead to psychological distress, as patients may feel embarrassed or self-conscious about their appearance. Three types of psoriasis are known to exist: nail psoriasis, which causes pitting and yellowing of the nails along with severe hyperkeratosis; skin psoriasis, which causes yellow pus to appear on the skin and blisters to appear near the joints; and psoriatic arthritis, in which bone erosion occurs near the joints [8]. Psychological distress can be exacerbated by the physical discomfort caused by the condition and the fact that psoriasis can be visible to the public. Covering nail or skin psoriasis with clothing is often tricky, and

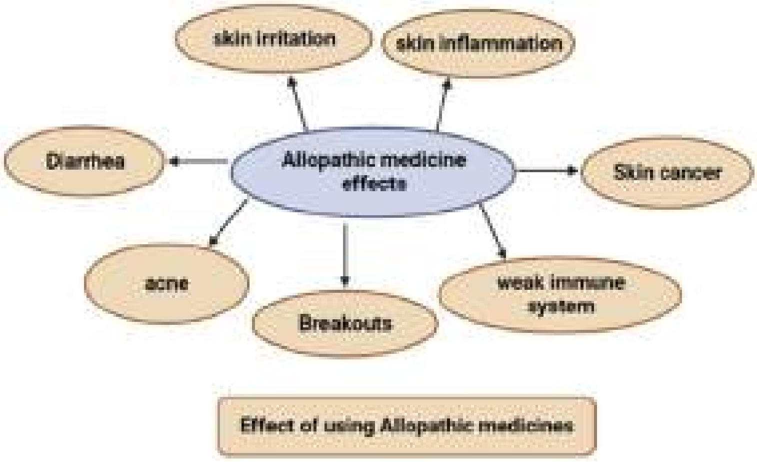

Fig. 4 Side effects of allelopathic medicines

psoriatic arthritis can cause severe pain and joint stiffness. All of these can lead to social isolation and a decrease in self-esteem.

3.5 Allopathic Approaches for Skin Disorders

Skin disorders treatment with allopathic medicines causes severe ripple effects and can be diminished by phytomedicines. Numerous hazardous effects occur due to these allopathic medicines, like skin inflammation, irritation, breakouts, and diarrhea. Immunosuppressants lead to skin cancer and a weak immune system [5] (Fig. 4).

4 Role of Phytomedicines for Skin Infection

4.1 *Azadirachta indica*

Neem, a member of the family Meliaceae, plays a significant role in the promotion of better health due to the presence of a high content of antioxidants, azadirachtin, glycerides, polyphenols, triterpenes, limonoids, beta-sitosterol, quercetin, catechins, carotenes, and vitamin C that contribute to its health-promoting effects. It has been used in Chinese, Unani, and Ayurvedic medicine for thousands of years. It has been used for centuries as a traditional medicine due to its anti-inflammatory, antibiotic, antifungal, and antiviral properties. It is also a key ingredient in many natural skin care and hair care products. The paste prepared from leaves helps treat acne, eczema, scabies, skin allergies, and psoriasis. Neem is also known to have antibacterial and anti-ulcer effects, making it an excellent tool for boosting the overall health of individuals. Additionally, it has been shown to help reduce cholesterol levels, improve digestion, and regulate blood sugar levels. Neem is also known for its antioxidant, anti-inflammatory, and anti-cancer properties that help boost immunity and relieve stress and anxiety. Neem is known to have antiviral and antifungal properties. The findings from earlier reports have confirmed that the role of neem and its constituents play an essential role in the pathogenesis of many diseases [86]. It treats various illnesses, such as malaria and intestinal parasites. In addition, neem has also been used to treat eye infections, gastrointestinal disorders, and fever. The bark of this plant helps maintain healthy gums, increases oral hygiene, and can also be used as an antiviral against chicken pox due to its antiviral properties. It can also reduce swelling, promote healing, and has contraceptive effects that can help manage neurodegenerative disorders and diabetes. As far as treating eczema, scabies, and other skin disorders is concerned, neem paste has a variety of beneficial effects. The product contains essential fatty acids that provide moisture and texture to the skin during the healing process by inhibiting the growth of inflammatory cells. Several studies have shown that the oil extracted from neem can treat ringworm, psoriasis, and scrofula diseases [10]. Oil extracted from neem is also one of the best herbal remedies for treating various skin disorders, allergies, infections, inflammations, and other skin disorders [11, 12]. The oil extracted from neem also reduces wrinkles, dark spots, and discoloration, excellently making it a tremendous natuan for minor skin irritations and infections. Applying neem and turmeric as lotion during night hours helps prevent scthe abies, eczema, and various logic problems. Neem can also be taken orally, either as a tea, in caps as a tea, or in capsule form to boost the immune system. Neem is also a natural insect repellent, making it useful for insects from gardens and homes away.

4.2 *Glycyrrhiza glabra*

It is a sweet and aromatic herb that comes from the licorice family. This herb's active metabolite is glycyrrhizin, an antiviral, anti-diabetic, antifungal, expectorant, demulcent, mild laxative, antioxidant, and skin-whitening substance. It is important to note that liquiritin, an antioxidant, is the anotis component of licorice that contributes to skin lightening. It also contains glycyrrhizin, which is known to have antibacterial properties that can help keep skin acne-free. It is believed to have many health benefits and has been used in traditional herbal medicine for centuries. Licorice has anti-inflammatory, antibacterial, and antioxidant properties that improve overall health and skin health. It also has a mild sedative effect, making it a popular choice for people looking for natural sleep aids. Despite its ethnopharmacological value, licorice has been explored worldwide due to its ethnopharmacological properties. Research has also suggested that it may positively affect cardiovascular health. Glycyrrhizin also shows potential in treating liver disorders, chronic bronchitis, and ulcers. In addition, research suggests that licorice may be beneficial in supporting cognitive function and mental health. Additionally, it is also a good source of valuable flavonoids and saponins as well. It may also help to reduce the risk of cancer and heart disease. The benefits of this plant provide a place for research and discovery of other benefits and potent effects that the plant has to offer. Licorice has also been used in traditional medicine for centuries, making it a trusted and reliable source of health and wellness. In addition, it is widely available and affordable, making it an attractive option for those seeking natural remedies. Glabridin is another constituent of *G. glabra,* which can lighten the skin's pigment due to its ability to inhibit the activity of tyrosine B16 in melanoma cells. Due to its anti-inflammatory and antioxidant properties, it reduces the appearance of wrinkles and improves skin texture. It has also been found to have beneficial effects on the skin, such as reducing redness and irritation. Additionally, licorice can also help protect skin from UV radiation and reduce melanin production, which can help with skin whitening. As a cosmetic, the herbal extracts of this plant can be used to depigment the skin and protect it from UV rays [13]. This can benefit those who want to lighten their skin tone or reduce the appearance of dark spots. According to various reports, root extracts of *G. glabra* have been proven effective in treating acne, eczema, and psoriasis. Furthermore, its anti-inflammatory properties can help reduce redness, pain, and swelling caused by skin conditions [14]. Licorice gel can control atopic dermatitis in patients with asthma and hay fever in their family history. Additionally, licorice helps to protect against UV radiation. It can also be used to treat cold sores and heal wounds. In combination with polyethene glycol, this gel can be applied at night along with polyethene glycol to reduce itching on the face [14]. Licorice gel can thus be used to reduce the severity of atopic dermatitis and for anti-aging purposes. It is important to note that licorice gel should be used in moderation and with the advice of a healthcare professional. In addition, some studies have shown that licorice extract also reduced pigmentation in the skin of black mollyfish by inhibiting tyrosine synthesis due to the dispersal of melanin (which contributes to skin tanning) from its location in the body. However, caution must be taken when using licorice gel as it can cause irritation and other skin conditions. It is, therefore, recommended to do a patch test before using the gel. As a result of the nutritional properties of licorice extract, new possibilities exist for the development of beautifying preparations that are safe, effective, and provide effective treatment for allergic dermatitis [15]. Such practices should be developed using carefully selected, high-quality raw materials and tested adequately in pre-clinical and clinical trials. This way, licorice gel can be used safely and effectively for its intended purpose.

4.3 *Ocimum sanctum*

It has become apparent that the "queen of herbs," *Ocimum sanctum* [16], has become a drug of choice for many people. Studies have found that this herb has anti-inflammatory, antibacterial, antifungal, and antiviral properties. Some essential constituents of basil are eugenol, ursolic acid, linalool, carvacrol, and rosmarinic acid, which are believed to have anti-inflammatory and antioxidant properties [16]. It has been used to treat various health conditions, ranging from colds and coughs to skin diseases and digestive issues. It is also known to boost immunity and fight oxidative stress. As it has been reported, it is used in several countries to treat various skin diseases and disorders, including allergies, rashes, insect bites, snake bites, scars, leucoderma, blisters, chickenpox, and roundworm infections. In addition, it has been used in traditional medicine to treat cancer, diabetes, and cardiovascular diseases. It is thought to reduce inflammation and boost the immune system. There is also evidence that the phyto extracts of basil are helpful in the reduction of itchy skin that occurs due to acne, pimples, and scars [17]. Studies have shown that basil effectively treats various conditions, including anxiety, inflammation, and skin irritation. Therefore, *O. sanctum* would be a striking plant for developing cosmetics. Its strong antibacterial and antifungal properties make it a viable option for producing natural skin care products. With its numerous therapeutic benefits, *O. sanctum* has the potential to be a valuable ingredient in the cosmetic industry. The first report of anti-aging activity has been investigated using collagenase, elastase, and hyaluronidase activity inhibition under in vitro conditions. These results suggest that basil could help reduce the visible signs of aging. Thus, basil could be a powerful and natural ingredient for skin care products. Some studies also confirmed the presence of rosmarinic acid in basil, which possesses potent antioxidant and anti-inflammatory activity that can protect the skin from damage caused by free radicals. Moreover, it can stimulate collagen production, which in turn can help reduce wrinkles and fine lines. *Extracts of basil* have inhibitory activities against oxidation, inflammation, collagenase, elastase, and hyaluronidase [18]. This indicates that *O. sanctum* extracts have the potential for use in cosmetics and dermatological applications due to their anti-aging properties. It can also be used to boost the immune system and reduce stress levels. Another report from a study includes the beneficial effects of herbal extracts as safe, effective, potent antibacterial, antiviral, and antifungal agents in controlling skin blisters, treatment of wound infections, chickenpox, and roundworm infections by modifying lifestyle [19]. Many skin disorders can be managed using tulsi plants, which have been found to have good herbal potential. Basil extract formulations and base (containing no extracts) were applied to the cheeks of 11 healthy human volunteers to determine the presence of erythema and melanin. Significant results were observed in the base product, while erythema decreased in the formulation. The study concluded that tulsi plants have the potential to manage skin disorders. Even though the melanin content of the skin increased significantly with the application of the base, it decreased with the application of the formulation [14]. The results indicate that the formulation containing the basil extract had a significant anti-inflammatory effect on the skin and a skin-lightening outcome. This suggests that basil extract could be helpful in skin care products. In addition, the essential oil from basil leaves has been used to treat headaches and other ailments. The compounds present in tulsi are believed to contribute to the therapeutic effects of basil, although further research is needed to understand the mechanisms of action fully.

4.4 *Andrographis paniculata*

This plant has been used for decades in the subcontinents of India to treat various diseases. It contains diterpenes, lactones and flavonoids, alkanes, keto aldehydes, and andrographolide. It helps treat pyrexia, dyspepsia, malaria, colic pains, dysentery, and diarrhea with aerial parts of the plants, roots, leaves, and whole plants of *Andrographis paniculata*. It has also been used to treat common colds and sore throats and improve the immune system. The plant is known for its antioxidant, anti-inflammatory, and anti-cancer properties. In this plant, there is a bioactive compound called andrographolide that is highly bioavailable and has anti-inflammatory, antioxidant, and other activities that can be used as a therapeutic agent to treat inflammatory skin diseases [20]. Andrographolide also exhibits various pharmacological activities, such as anti-tumor, anti-arthritis, and anti-diabetic. Furthermore, it can also be used as an analgesic and anti-diabetic agent. *A. paniculata* helps cure primary skin infections like eczema and leukoderma. Moreover, it can be mixed with oil and applied to treat wounds as a paste on the skin [21]. This compound also helps reduce inflammation and itching while promoting the healing of wounds. It is also known to have antibacterial, antifungal, and antiviral properties.

4.5 *Emblica officinalis*

*As a medicinal herb, Emblica officinalis, also known as Indian gooseberry or Amla, is used for the treatment of various skin disorders and diseases. A*mong the chemical constituents, it contains tannins, polyphenols, gallic acid, alkaloids, emblicanin A and B, phyllembein, quercetin, ascorbic and ellagic acids, vitamins, and minerals. It is also believed to have anti-inflammatory and antioxidant properties, which can help the body fight against diseases. Amla can be eaten raw or taken as a supplement and has been used in traditional medicine for centuries. It has been found that the fruits of this plant have immense pharmacological and medicinal applications. It also boosts immunity, improves digestion, and reduces cholesterol levels. Amla has been used to treat diabetes, high blood pressure, and other health conditions. Amla is highly valued in Ayurveda for its therapeutic properties and is used in various herbal preparations. It is also known to be a rich source of antioxidants, essential for fighting free radicals and maintaining overall good health. In addition to its antioxidant properties, it also has anti-inflammatory and wound-healing properties. Amla is also rich in vitamin C, which helps boost the immune system and protect against infectious diseases. Furthermore, it is known to have anti-aging benefits, helping to keep skin looking youthful and healthy. Several conventional therapeutic agents can be replaced with remarkable herbs due to their outstanding efficacy and lack of side effects [22]. Amla is one such herb that provides a wide range of health benefits. Ayurveda, an ancient Indian medical practice, highly recommends amla and rasayan due to their antioxidant properties as part of its daily healthcare regimen that can help protect the body from the damaging effects of free radicals. They can also help to promote healthy skin, hair, and nails. According to various reports, amla contains high amounts of vitamin C, making it an effective hair tonic and treatment for warts and skin infections [23]. Amla is also rich in minerals like calcium, phosphorus, iron, and carotene, essential for healthy bones, teeth, and muscles. Rasayan provides various health benefits, including promoting better digestion, boosting immunity, and relieving stress [22]. In addition, amla is known to have anti-inflammatory properties, which can help reduce inflammation and pain associated with arthritis. It has been suggested to help lower cholesterol levels. Oral consumption of amla helps improve the condition in females, and drinking the extract improves the skin's elasticity and reduces the appearance of wrinkles [24]. Additionally, this fruit is known to be full of vitamins and minerals that are essential for overall health and well-being. It inhibits microbial adhesion, inactivates enzymes, suppresses influenza A virus, prevents viral absorption, and treats HIV by inhibiting HIV-RT [22]. Furthermore, it has been used to treat various skin conditions such as acne, eczema, and psoriasis.

4.6 *Aloe vera*

It is one of the most valuable and oldest herbs belonging to the family Liliaceae, indigenous to India, and belongs to the genus Aloe vera*. Aloe vera* has traditionally been used to treat various ailments, including skin conditions, digestive issues, and inflammation. It contains many nutrients, including folic acid and vitamins A, C, E, and B12. It also contains calcium, manganese, zinc, and magnesium minerals. The most investigated active compounds are aloe-emodin, aloin, aloesin, emodin, and acemannan [28]. Several species of Aloe have been used to prevent and treat skin-related problems for a long time. *Aloe vera* also contains a range of anti-inflammatory compounds, which have been found to have antibacterial, antifungal, and antiviral properties. It is a natural ingredient in many skin care, hair care, and health products. Depending on the individual application, aloe materials can be used for cosmetic, radiation, cancer, wound healing, and antimicrobial purposes [25]. It is also known to aid digestion, reduce constipation, and help regulate blood sugar levels. *Aloe vera* can also be taken orally as a juice or in capsule form. Additionally, *aloe vera* can be applied directly to the skin as a topical remedy. There is a derivative of *aloe vera* called aloesin, which helps to lighten dark patches, age spots, and acne marks. *Aloe vera* is also known to possess anti-inflammatory and antioxidant properties, which can help to reduce inflammation and protect the skin from environmental damage. It can even help to reduce the signs of aging, making skin look smoother and more youthful. As one of the most potent skin healers on the planet, this herb is used to treat sunburns, insect bites, wound infections, cuts, itching, and swelling in people worldwide. *Aloe vera* is also beneficial for treating skin conditions such as psoriasis, eczema, and acne. It is also used to reduce the appearance of scars, stretch marks, and dark spots. As a result of its antioxidant, antiaging, and anti-wrinkle properties, it purifies and detoxifies the skin. Aqueous extract from this plant is crucial in repairing damaged skin cells, reducing wrinkles, curing acne, reducing pimples, treating eczema, and working as a herbal gel for glowing skin [26]. Kumar et al. [27] published an eminent report regarding the application of *aloe vera* to wounds and burns. *Aloe vera* also helps treat psoriasis and other skin problems due to its anti-inflammatory and antibacterial properties [28]. It is also used in the treatment of skin cancer [29].

4.7 *Carica papaya*

Carica papaya is a herbaceous succulent plant, popularly known as pawpaw, belongs to the Caricaceae family and is considered the powerhouse of all vital nutrients for medicinal use. The roots, pulp, bark, seeds, and peels can be utilized for various ailments due to abundant vitamins and enzymes. The active components in papaya are alkaloids, glycosides, tannins, saponins, and flavonoids, responsible for medicinal activity. Platelet count can be increased if leaf juices are given to dengue fever patients [30]. The principal constituent of papaya is papain, which has antioxidant, antifungal, and antiviral effects. It is one of the safest and most widely promoted nutraceuticals against diseases like eczema, warts, and skin infections, preventing premature aging and scabies and reducing itching and wrinkles. Due to its inflammatory activity, papaya extract has wound-healing properties. Papaya peels can be used as potent sunscreen and, when mixed with honey, can be used as a skin-lightening and moisturizing agent. Adding lemon juice to papaya pulp can be used as anti-dandruff, and blending essential oils with papaya can be a good muscle relaxant [31].

4.8 *Jatropha curcus*

Jatropha is a drought-resistant, perennial plant belonging to the family Euphorbiaceae, famous for the production of biodiesel along with several medical applications. It contains terpenoids, coumarins, alkaloids, phenols, steroids, flavonoids, tannins, lignoides, and coumarins. Latex of Jatropha contains Jatrophine, Jatropha, and curcumin with anti-cancerous properties that help heal central skin lesions with wound healing properties and have purgative, anti-helminthic, and abortifacient effects. The oil produced from seeds help manage parasitic skin infections, which validates the plant in minimizing skin infections by promoting the healing of wounds with potent anti-inflammatory and antimicrobial processes [32]`.

4.9 *Zingiber officinalis*

Ginger belongs to the Zingiberaceae family, which can be used as a medicine and flavoring agent. Among the many essential components of ginger, gingerol *helps form new blood vessels at the site of damaged skin, promoting the repairing of skin cells and reducing the pain the patient feels.* Gingerol has potent medicinal properties like anti-inflammatory, antioxidant, and anti-tumor properties and can help protect against bacteria and viruses. It also contains carbohydrates, lipids, terpenes, and phenolic compounds, a popular ingredient in many Asian cuisines. It is also known for herbal ointments that can treat primary skin lesions. These ointments usually contain natural ingredients such as *aloe vera*, tea tree oil, and lavender oil, which can help reduce inflammation and promote healing. They are gentle and typically well-tolerated by people with sensitive skin. It has been shown that the oil obtained from seeds can be used to treat parasitic skin infections through its ability to promote wound healing and wound care and its potent anti-inflammatory and antimicrobial properties [33]. It also has antifungal and antiviral properties, making it an ideal choice for treating skin infections. Furthermore, it can help to protect the skin from further damage and irritation. Ginger can be consumed in various forms, including fresh, powdered, dried, and as an oil or extract. A ginger extract can help improve the structure and function of the skin, as well as reduce the formation of wounds that do not heal and make skin susceptible to disease. It also helps to improve the production of collagen, which is essential for skin health and increases the body's antioxidant capacity. Ginger may also help reduce wrinkles, age spots, and other signs of aging. It helps reduce inflammation, which is a significant cause of skin damage and can help reduce the risk of skin cancer. In addition, ginger can help to regulate oil production in the skin, helping to keep it balanced and healthy. In a study conducted on corticosteroid-treated rats, pre-treatment with topical ginger and curcumin extract improved the healing of induced abrasion skin wounds [34]. The study concluded that ginger and curcumin extract have a protective effect on the skin and can help wound healing and reduce inflammation. It also helps to reduce pain and can improve digestion. Gingerol can also help improve circulation, lower cholesterol levels, and improve immunity. It has also effectively combat bacterial, fungal, and viral infections. *The root extracts of ginger have been explored for their activity against various skin problems.* Ginger can also be a natural remedy for headaches, nausea, arthritis, and menstrual cramps. It can also treat multiple respiratory issues such as cough, cold, and sore throat. *The herbal extracts of ginger help in wound healing by improving skin texture and structure.* Additionally, ginger can relieve digestive issues such as indigestion and bloating. *The combination of ginger and turmeric helps to speed up the healing process of wounds.* It has been observed that when ginger extract, which is also an anti-inflammatory agent, is applied to mice ears, croton oil-induced edema can be inhibited by inhibition of cytokines cyclooxygenase and nitric acid production. In addition, ginger extract has been found to reduce inflammation and pain in cases of rheumatoid arthritis. Due to its antioxidant properties, ginger helps to protect against oxidative stress and tissue damage. There has also been evidence that wound-healing mechanisms have been observed in humans when these results have been simulated [34]. These findings suggest that ginger and turmeric can help to reduce inflammation and support the healing of wounds. In addition, applying these natural ingredients can reduce the need for other medications, such as antibiotics.

4.10 *Eucalyptus globulus*

It is estimated that there are more than 600 species of eucalyptus in the large genus Eucalyptus within the family Myrtaceae. Eucalyptus is also a famous ornamental tree, grown for its exciting bark and the shade it provides. It contains sideroxylonal C, leptospermone, grandinol, cypellogins A, B, and C, (+)-oleuropeic acid, cypellocarpins A, B, and C, and isoleptospermone. Many of these species are native to Australia and are used for their medicinal and aromatic properties in many cultures worldwide. Eucalyptus provides a wide variety of herbal by-products, food additives, antioxidants, healing properties of wounds, and protection against many fungal infections. They are also known to have anti-inflammatory, antiseptic, and antiviral properties. It is also used as an insect repellent, and its leaves and bark can be used to make tea. There are reports of different species of eucalyptus, like *Eucalyptus globulus, E. maculate*, and *E. viminalis,* in managing acne, scabies, and skin infections. Also, it offers a cooling sensation to significant cuts and wounds at the site of application, thereby reducing inflammation at the site of application [35].

4.11 *Euphorbia hirta*

The Euphorbia hirta *plant is a pantropical weed and is part of the Euphorbiaceae family.* It contains alkaloids, flavonoids, terpenes, chromenes, and sterols from all the plant parts. Quercetin is the active metabolite in euphorbia with potent antioxidant and anti-inflammatory properties that can be used to treat severe wounds, boils, and swellings. It is one of the oldest herbal medicines used today and is an effective remedy for acne, warts, and cancer. *E. hirta* is also known for its anti-inflammatory, antiseptic, and antifungal properties, making it a popular choice for treating skin ailments. It can also treat colds, fevers, and stomach pain. If you mix the extract with warm coconut oil and turmeric, it can be used to relieve the itching of boils and sores that are caused by bacteria. Roots of *E. hirta* are also adequate food nutrients for infants and breast-feeding mothers and are effective against snakebites. It has sedative properties and treats urinary tract infections [36]. The extract of *E. hirta* is also used to treat fever, diarrhea, and dysentery. It also improves digestion and treats respiratory problems such as asthma. It has analgesic properties and is used to relieve pain. Not only that, but it is also used to treat fever, cough, and other respiratory ailments. In addition, it is an effective anti-inflammatory and antiseptic. It can be administered topically to relieve pain and reduce swelling.

4.12 *Ficus carica*

In temperate climates, the fig tree (*Ficus carica* L.) is one of the world's oldest cultivated trees and one of the most popular edibles. It produces a sweet, nutritious, and versatile fruit enjoyed in fresh and dried forms. Figs are a high source of fiber, vitamins, and minerals, making them a great addition to any diet. It also contains phenolic acids and flavonoids. They are also known for their anti-inflammatory and antioxidant properties. There are two types of figs: fresh and dried. Fresh figs are available in the summer and early fall, while dried figs are open year-round. Figs can be enjoyed in various dishes, from salads to desserts. They can also be eaten as a snack on their own. Fresh figs are widely eaten near production areas because they are highly perishable. Figs have several nutrients, including fiber, potassium, calcium, and iron. Dried figs are a good source of dietary fiber and calcium. They are also a good source of minerals like magnesium, manganese, and copper. Figs are a good source of antioxidants, which can help protect the body from damage caused by free radicals. Several health benefits can be gained from the fruits, including treating skin ulcers, eczema, acne, skin dryness, and wounds, and preventing the aging process. It has also been found to have cholesterol-lowering properties and can aid in weight loss. Figs may also help reduce the risk of certain types of cancer. It has been shown that when applied to human cheeks for 8 weeks to investigate melanin, sebum, and trans-epidermal edema, the fruits reduced hyperpigmentation, acne, and wrinkles after 8 weeks of application. Figs may also have anti-inflammatory properties and can help protect the skin from environmental damage. Furthermore, they are a good source of dietary fiber and other essential nutrients. It has been suggested that the herbal extract of ficus can be used as a source for future skin care products [37]. Figs are a rich source of antioxidants, which can help to repair and protect the skin from oxidative stress. They also contain polyphenols, which can help to reduce the appearance of wrinkles and fine lines. Overall, figs can be a powerful source of nutrition for skin health.

4.13 *Allium cepa*

Since ancient times, onions have been used in the traditional Ayurvedic system of medicine. It contains Kaempferol, Myricetin, Quercetin, Quercitrin, and Allyl sulfide. For managing skin allergies and anti-aging, fruits and bulbs contain essential constituents such as pyruvic acid and quercetin. Onion helps as a remedy for various infections, including healing wounds, scarring, and cancers. Onions are rich in antioxidants, which help to reduce inflammation and fight infection. They also contain sulfur compounds that help to kill bacteria, fungi, and viruses. Onion juice is often used as a topical treatment for skin infections, and the poultice helps reduce scars. Raw or cooked onions can also be consumed for various health benefits, including improved digestion and cardiovascular health. In addition, onion extract has also been found to help prepare new herbal skin care products due to its anti-aging properties [38]. Onion extract is also rich in antioxidants, which help protect the skin from environmental damage, eczema, and psoriasis and reduce inflammation. It can also help reduce wrinkles and make the skin more elastic. Onion extract can also lighten the skin, reduce acne, and tighten facial pores. It can even help reduce dark circles under the eyes. The onion can be a skin irritant because it stimulates blood circulation, thus causing the skin to itch. Onion extract is also an effective antiseptic, helping to reduce the risk of infection and soothe sunburns and other minor skin irritations. Finally, it can also act as a natural skin toner. The poultice can also treat boils and warts and produce heat to speed up healing. Due to its strong scent, the onion can also be used as a natural insect repellent. It can also be used as an antiseptic to help protect wounds from infection. It inhibits ultraviolet B (UV-B) Inhibits free radical scavengers.

4.14 *Abrus percatorius*

It is also known as a jequirity bean or rosary pea containing a potent poison known as abrin. It also has luteolin, orientin, isoorientin, glycyrrhizin, abrectorin, abrusoside A to D, abrusogenin desmethoxycentaviridin-7-o-rutinoside, and abruquinones D, E, and F. The leaves with lime can be applied to scars, sores, blisters, and skin allergies. It helps stimulate blood circulation, prevents gray hairs, and heal wounds and leukoderma [40]. It also helps in controlling inflammation and cure rabies. The seeds also have insecticidal properties and can control worm infections [39].

4.15 *Daucus carota*

Carrots are the oldest cultivated vegetables and produce different colored varieties with different nutrients and flavors. It contains beta carotene, fiber, vitamin K1, potassium, antioxidants, and lutein. The presence of rich beta carotene maintains immunity, vision, and skin health by converting it into vitamin A in the body. Carrot oil is considered the bootstrapper of rich available vitamins A and E, which is beneficial for skin and hair and prevent wrinkles and aging [41]. It also produces ample vitamin C, producing collagen in the body. It is an essential protein for making the skin elastic and preventing wrinkles. It is also an excellent moisturizer with antiseptic and calming effects. It helps in detoxification to treat different skin problems. When mixed with sunflower, the roots of this plant can be a good anti-tanning agent. A study was conducted to determine the SPF of carrot oil as it contains high B-carotene concentration. Four oils, i.e., carrot seed oil, wheat germ oil, jojoba oil, and olive oil, are selected for B-carotene, a vitamin A precursor. It also contains vitamin B1, B2, B5, B6, and B9. Another study was executed with *Aloe vera*, *Cucumis sativus* and *Daucus carota* to prepare a polyherbal cosmetic cream. Oil in water preparations is incorporated with stearic acid and cetyl alcohol. The results of the studies showed no redness, edema, irritation, or inflammation on the skin of individuals, indicating that the formulation is stable and safe for the skin [42].

4.16 *Menta piperata*

Peppermint, an aromatic plant hybrid mint, is a combination of the flavors of spearmint and wild mint. It contains essential oils that contain menthone and carboxyl esters, mainly menthyl acetate, and dried peppermint contains volatile oil containing 1,8-cineol, menthone, menthol, menthofuran, and methyl acetate. Since ancient times, this herbal remedy has been used for various ailments, such as digestive problems, headaches, colds, and skin conditions. It helps reduce dandruff and the growth of hair lice due to its antimicrobial and antiseptic effects. It increases blood circulation in the scalp and can be used in the preparation of creams, shampoos, and various hair and skin products and also helps in preventing hair loss [43]

4.17 *Beta vulgaris*

Beetroot, the root vegetable, is deep red. It contains flavonoids, betalains (betaxanthins and betacyanins), saponins, polyphenols, and inorganic nitrate. It also contains potassium, zinc, sodium, copper, phosphorus, calcium, magnesium, iron, and manganese.

It contains flavonoids, betalains (e.g., betacyanins and betaxanthins), saponins, polyphenols, and inorganic nitrate. It also contains potassium, zinc, sodium, copper, phosphorous, calcium, magnesium, iron, and manganese. It has many health benefits, such as boosting stamina, reducing inflammation, and protecting cells from damage. Beetroot can be eaten raw, roasted, boiled, or juiced. Beetroot juice is rich in antioxidants and nutrients which improve skin health. When the phytoconstituents were investigated from their aqueous and methanolic extracts, they were rich, especially in quercetin, kaempferol, and phenolic compounds. Ointments were prepared at different concentrations and treated against acne and psoriasis, which showed a healing effect for acne. It was also observed that dried leaf extracts were more predominant than fresh leaf extracts. The dose prepared in the solution was more effective than ointment. The same result was obtained in the case of psoriasis, but in this case, the psoriasis ointment dose was more efficacious [44].

4.18 *Musa paradisiaca*

Beauty treatments, especially for skin and hair, are most effective with bananas. It contains Leucocyanidin (flavonoids). A small piece of banana skin placed on the wart with the yellow side out can treat warts. Banana peel can also help treat poison ivy rashes by rubbing the peel over the rashes. Rubbing peel on sore skin can increase discomfort. It helps reduce skin allergies, warts, poison ivy rashes, irritation, and inflammation. In such cases, a thick paste can be applied, reducing irritation and inflammation. Drinking smashed bananas in milk 2–3 times a day can treat skin allergies [23].

4.19 *Persea americana*

The avocado is an evergreen tree called an alligator or avocado pear. Due to the presence of vitamin C, vitamin E, carotenoids, and polyphenols, these compounds have an antioxidant effect, protecting cells from free-radical damage. It contains flavonoids, tannins, phenolic compounds, saponins and alkaloids, hydroxybenzoic acid, ferulic acid, catechin, caffeic acid, coumaric acid, chlorogenic acid, and triterpenoid glycosides. It also helps in the treatment of psoriasis, wrinkles, and stretch marks [45, 46].

4.20 *Calendula officinalis*

An annual and perennial herb with medicinal properties. Calendula CO2 extract acts as a well-standard cosmetic preparation, especially for the preparation of ointments for different skin diseases as well as for the preparation of cosmetics. It contains adinol, carotenoids, isorhamnetic, saponins, triterpenes, sesquiterpenoids, scopoletin, flavonoids, quercetin, and kaempferol. Anti-inflammatory principles of marigold by CO2 extraction are due to pentacyclic triterpene alcohols such as faradiol-3-monoesters and taxa sterols, which are the essential ingredients [47]. The extract was proven to be an effluent scavenger of hydrogen peroxide radicals under in vitro studies within the mitochondria of rat cardiac muscles. The section shows excellent antioxidant activity due to carotenoids, flavonoids, and polyphenols [48]. Water-alcohol extracts of marigolds were checked for their antimicrobial, antifungal, and antiviral properties against acne and dermal problems among young stars at the beauty and edicationsl centre "Top Beauty" in Sofia [49].

4.21 *Coffea arabica*

Coffee has been cultivated and consumed for centuries and contains caffeine, a stimulant that boosts energy and chlorogenic acid, which reduces redness when exposed to UV. It also has antioxidants and other beneficial compounds. Coffee can produce collagen and elastin and protect the skin from moisture loss. Coffee can protect against photo aging. According to the study by researchers, when hairless mice were exposed to UVB rays, and then caffeine applied to them 3 times/week for 11 weeks, they showed limited photodamage. This may be due to apoptosis (programmed cell death) of UVB, which removes damaged skin cells before they cause aging and skin cancer. An innovative facial cream has been designed that includes ingredients that help in improving the appearance of wrinkles, firmness, redness, and texture. According to different researchers, coffee bean extract rejuvenates skin aging. There were significant improvements in the formation of wrinkles, firmness, redness, and consistency of facial skin, and it also helps to prevent the development of aging and inflammatory skin disorders [50–53].

4.22 *Cucumis sativus*

It is a creeping plant widely cultivated for its edible fruit, which contains 95% water, 4% carbohydrates, and 1% protein with negligible fat content. It contains alkaloids, flavonoids, and a cyanogenic glycoside. *Cucumis sativus* extract mixed with *Glycyrrhiza glabra* extract and almond oil was evaluated for redness, edema, inflammation, and irritation. It was observed to be safe to use for skin [54]. The extracts of *Cucumis sativus* were investigated for their antimicrobial and antioxidant properties, and their cosmetic value in the treatment of acne shows the presence of phenolic and flavonoid compounds in fresh and dried plant extracts. An herbal cream prepared with fresh cucumber extract mixed with tea tree oil and linseed oil showed good spreadability, consistency, ease of removal, and no evidence of phase separation [55]. Herbal cream made of cucumber fruits, *Cyperus rotundus* roots, and almond oil were tested, showing no edema, redness, inflammation, or irritation during irritancy studies. These plant formulations are safe for use on the skin [56]. An emulsion of 3% cucumber extract and lemon oil was prepared to adjust the odor. The formulation was then evaluated to see the effects on sebum, erythema, melanin, moisture, and water loss on the skin of healthy human volunteers for 4 weeks. The odor was adjusted with a few drops of lemon oil. Over time, the smell disappeared due to the volatilization of lemon oil. The formulation shows eloquent effects on skin sebum secretion in which there was an increase in erythema while skin dehydration level and melanin in the skin decreased [57].

4.23 *Allium sativum*

It is an aromatic herb known for its biological properties and is a good source of antioxidants. It contains allicin, alliin, S-allyl cysteine, and methiin. When administered orally, it affects ultraviolet protection, cancer treatment, and immunologic properties.

Topically, garlic extract is effective against viral and fungal infections, alopecia areata, skin aging, psoriasis, keloid scar, leishmaniasis, and cutaneous horn. It also helps in skin rejuvenation and wound healing. However, the effectiveness of oral and topical garlic extract application is not yet appropriately explored [58]. An herbal shampoo was prepared with aqueous extract of *Allium sativum,* coconut oil, castor oil, and olive oil. The results of this combination help produce stable herbal shampoo with good foam formation, foam quality, and proper retention [59].

4.24 *Vitis vinifera*

Grapes are a rich source of antioxidants due to the presence of valuable phenolic compounds. It also contains flavonols, proanthocyanidins, flavon-3-ols, myricetin, flavonoids, peonidin, resveratrol, tannins, quercetin, anthocyanins, kaempferol, ellagic acid, and cyaniding. These phenolic compounds have anti-aging, anti-inflammatory, and antimicrobial actions and can permeate through the skin's barriers. The phenolic compounds present in grapes are the source of natural ingredients for cosmetics [60], fighting against acne [61], skin tightening and healing [62], reduction of dark circles surrounding eyes, hydration, anti-aging [63, 64], and UVB radiation protection [65, 66]. The active ingredients extracted from grapes can be used as cosmetics like skin-conditioning, antioxidants, flavoring agents, and colorants. The safety of concentration and use of these active ingredients from grapes has been confirmed by The Cosmetic Ingredient Review Expert Panel [67].

4.25 *Punica granatum*

The pomegranate is a fruit with a great deal of nutritional value, and its juice is an excellent source of antioxidants, vitamin C, and polyphenols, which may have health benefits in the future. It also contains gallic acid, ellagic acid, punicalagin's, and punicalins. Studies have shown that drinking pomegranate juice can improve heart health, reduce inflammation, and even boost memory. It is also a rich source of fiber, potassium, and vitamin K. A pomegranate extract, which is made from the peel, seeds, or flowers of the fruit, has been used in traditional medicine systems for a long to treat inflammations, infections, and cancers, among other conditions. An evaluation was carried out in a study in which creams were formulated with neem oil, jamul powder, and carrot powder at different concentrations based on the antioxidant properties of the phytoextracts and evaluated [68]. Upon evaluation of the extract and seed oil, it contained high levels of ellagic acid (peel, juice, seed extract) and punic acid (seed oil). Aside from these components, pomegranate derivatives contain other polyphenols that make them practical and valuable as anti-inflammatory and anti-aging agents for topical application. There are several advantages for using pomegranate seed oil, including its moisturizing and nourishing properties. Additionally, pomegranate seed oil can help reduce wrinkles and signs of aging and promote skin elasticity and firmness. It can also help to protect the skin from sun damage and environmental stressors. As a result, it is excellent for mature and aging skin, dry and cracked skin, and irritated and sunburnt skin. Pomegranate seed oil is also non-greasy and has anti-inflammatory properties, making it suitable for all skin types. It can also be a natural remedy to reduce acne, diminish blemishes and scars, and balance oily skin. This oil is used for treating acne, eczema, psoriasis, and rosacea and assisting in several specialist facials and body treatments. Additionally, pomegranate seed oil is a potent antioxidant, rich in fatty acids and vitamin C, which helps reduce inflammation and protect against free radical damage. It also helps to improve the skin's elasticity and can help to reduce wrinkles and fine lines. The combination of pomegranate and oil extracted from seed is highly effective in reducing and preventing fine wrinkles and firming up the epidermis [69]. It can also provide intense hydration and help to reduce inflammation while providing antioxidant protection. Pomegranate seed oil is also known to be a natural sun protectant and can help reduce age spots' appearance. Fermented juice and seed oil flavonoids of pomegranate were studied for antioxidant and eicosanoid enzyme inhibition properties. Pomegranate fermented juice (PFJ) and cold-pressed seed oil (PCPSO) showed vigorous antioxidant activity. A study of total phenols in PCPSO showed the presence of punicic acid (65.3%) along with palmitic acid, stearic acid, oleic acid, linoleic acid, and three unidentified peaks from which two peaks are probably isomers of punicic acid [70]. A study was conducted to check the sunscreen activity of combined *Pongamia pinnata* leaf extract and *Punica granatum* peel extract. To determine the sun protection factor, absorption spectroscopy, transmission spectroscopy, and the COLIPA standard method were used. Absorption spectroscopy measures the amount of UV radiation absorbed by the sunscreen, while transmission spectroscopy measures the amount of UV radiation transmitted through the sunscreen. The COLIPA standard method measures the amount of UV radiation reflected by the sunscreen. Combining the results of these three methods allows the sun protection factor to be accurately determined. Evidence suggests that sunscreens do a better job of protecting against UVA and UVB rays following the study by Patil and Fegade [71]. This is because the COLIPA standard method is designed to measure the radiation reflected by the sunscreen rather than the amount absorbed. This allows for a more accurate measurement of the sun protection factor, vital in protecting skin from the harmful effects of UVA and UVB rays.

4.26 *Cucurbita maxima*

The pumpkin is a fruit rich in nutrients, antioxidants, and fiber and has various health benefits, especially for the eyes, heart, skin, and immune system. Beta-carotene, an antioxidant in pumpkin, helps protect the cells from damage from free radicals and can reduce inflammation. It also contains vitamin A, which helps maintain healthy vision, and vitamin C, which helps strengthen the immune system. It contains peptides, fixed oils, carotenoids, polysaccharides, para-aminobenzoic acid, proteins, γ-aminobutyric acid, and sterols. Additionally, due to the presence of fiber in pumpkin, it helps to keep the gut healthy and can reduce the risk of certain diseases. Pumpkin also contains zinc, phosphorus, iron, magnesium, calcium, ferulic acid, alpha-linolenic acid, vitamin A, and vitamin B. The vitamins and minerals in pumpkins are essential for maintaining healthy vision, skin, cardiovascular, and immune health. The vitamins A and B are necessary for healthy skin and eyes, while zinc, magnesium, iron, phosphorus, and calcium are essential for bone, muscle, and heart health. Ferulic acid and alpha-linolenic acid's antioxidant and anti-inflammatory properties also benefit overall health. In addition to these nutrients, it contains other components such as copper, niacin, thiamin, riboflavin, salicylic acid, ferulic acid, unsaturated oils, retinol, antioxidants, and beta-carotene. As a powerful antioxidant and mild alternative to retinoic acid, pumpkin is an exfoliation accelerator. Zinc in pumpkin helps in wound healing by boosting the immune system and promoting the production of collagen in the skin, which helps keep the skin elastic and reduces the appearance of wrinkles. Beta-carotene and retinol are both antioxidants that help to protect the skin from damage caused by free radicals. The salicylic acid and unsaturated oils help to exfoliate the skin and reduce the appearance of pores. In addition to being rich in vitamin A derivatives, pumpkin also contains retinoids that hold a high affinity for the retinoic acid receptors in the skin, activating the cellular turnover process. In addition to its keratolytic properties, pumpkin enzymes are an excellent non-abrasive preparation for much stronger exfoliations while at the same time reducing the oxidative and free radical stress associated with chemical exfoliants [72]. Retinoids are a form of vitamin A that helps to reduce wrinkles, improve skin firmness, and even out skin tone. Pumpkin's retinoids target the retinoic acid receptors in the skin, which helps to promote skin cell turnover and reduce oxidative and free radical damage. This makes pumpkin enzymes an ideal choice for gentle exfoliation that can produce results similar to more potent chemical exfoliants.

4.27 *Camellia sinensis*

Green tea is one of the richest sources of antioxidants and catechins. Other compounds like theaflavins, Quercetin, L-Theanine, GABA, statin, and aromatic volatiles are also present. Furthermore, it has astringent properties as well. The raw material of green tea has a wide range of applications as a raw material. The catechins in green tea are known to have anti-inflammatory and antibacterial properties and are great for cardiovascular health. The astringent properties help to reduce inflammation, soothe skin, and even help to reduce wrinkles. Additionally, the raw material of green tea can be used in various ways, from skin care products to herbal teas. It also contains anti-inflammatory, antibacterial, and antiviral properties capable of boosting the immune system and protecting the body from infections [73]. The astringent properties of green tea work to tighten and tone the skin, which can reduce the appearance of wrinkles and other signs of aging. The antibacterial and anti-inflammatory properties can help reduce redness and inflammation, while the antiviral properties can help protect against viruses and other pathogens. As a result of the presence of polyphenols and other ingredients in the product, it may also provide some skin benefits. The polyphenols in green tea can neutralize free radicals, which are molecules that can cause cellular damage. This can lead to both anti-aging and skin protective benefits. Additionally, green tea can help to reduce inflammation and redness from skin conditions such as acne or rosacea. The antibacterial and antiviral properties of green tea can also help to reduce the risk of bacterial or viral infections on the skin. It has been reported that the formulations of green tea have been evaluated regarding the corneum transepidermal water loss status: water content, viscoelastic-to-elastic ratio (UV/UE), and skin microrelief. According to the results revealed from applying green tea extract for an extended period, this extract has a prolonged moisturizing effect on the skin. This can be attributed to the polyphenol and proanthocyanidin compounds present in green tea, which have antioxidant properties that help to protect the skin from environmental damage. Additionally, the polysaccharides in green tea help increase the skin's water content and create a protective barrier that helps lock in moisture. The skin microrelief improved significantly due to the topical application of the formulation [74]. The moisturizing effect of the green tea extract was due to its ability to increase the water content of the stratum corneum and reduce the transepidermal water loss. This resulted in a higher viscoelastic-to-elastic ratio (UV/UE) and improved skin microrelief. These effects were long-lasting, indicating the potential of green tea extract to be used as a moisturizing ingredient.

4.28 *Curcuma longa*

Curcumin is one of the main components of turmeric, a common spice known for its antioxidant and anti-inflammatory properties, which can help with various ailments such as arthritis and digestive issues. It also contains saponin, alkaloid, sterol, tannin, flavonoid, phytic acid, and phenol. It is also believed to have cancer-fighting properties. An evaluation of the effect of a cream prepared from turmeric extract on skin sebum secretion in humans was conducted using a sebumeter to measure the impact of the cream on human volunteers. The results showed that the cream had an anti-sebum effect and improved the skin's elasticity, which is beneficial in reducing wrinkles and other signs of aging. The anti-inflammatory and antioxidant properties of curcumin were also demonstrated, as the cream improved skin hydration and decreased the appearance of wrinkles. The DPPH method was used to determine the extract's antioxidant activity. In the 6th week after applying the cream, there was a significant increase in the observed sebum values. This suggests that the curcumin extract was able to penetrate deep into the skin and have a positive effect on the sebum levels, which helps to maintain healthy skin and reduce wrinkles. Additionally, the DPPH method is often used to measure antioxidant activity, and the findings suggest that the curcumin extract had a significant positive effect [75].

4.29 *Crocus sativus*

The spice of saffron is a precious spice, an expensive and rare spice that has been used in medicine for centuries. There are three main constituents of saffron, namely, croccin, picrocrocin, and crocetin, as well as safranal. It is harvested from the crocus flower and has many medicinal properties. It treats various illnesses, such as depression, anxiety, and insomnia. Saffron is also used in cooking to flavor and color dishes. Saffron is also known to have inflammatory and antioxidant properties, making it a voguish component in traditional medicines. It is also used in perfumes and cosmetics and is widely used in the Middle East and India. It is used to evaluate the antioxidant properties of saffron by using the DPPH (2, 2-Diphenyl-1-picrylhydrazyl) method (2, 2-Diphenyl-1-picrylhydrazyl). Using a hexameter, a water-in-oil (w/o) formulation of this plant extract was evaluated in human volunteers for the amount of melanin and erythema in their skins. A significant depigmentation and anti-erythematic effect were observed on human skin due to these results. In addition, applying the saffron formulation may also be beneficial in treating melanoma in humans. Further studies are necessary to assess the effect of *C. sativus* extract on melanoma. Animal studies can also be conducted to understand the mechanism of action better. Additionally, the safety of long-term use of the extract should be determined [76].

4.30 *Fragaria vesca*

Strawberries are not actual berries but are the richest source of vitamin C, manganese, folate, potassium, antioxidants, polyphenols, anthocyanins, and vitamins. Anthocyanins, ellagic acid, flavonols. The potential photoprotective capacity of different strawberry-based formulations was assessed in human dermal fibroblasts (HuDe) exposed to UV radiation, which showed noticeable photoprotection in HuDe, increasing cell viability due to the presence of Coenzyme Q10 (antioxidant) [77]

4.31 *Passiflora incarnata*

It is a flowering tropical vine which gained a lot of attention as it is a powerful source of antioxidants. Seed Oil is a superior salve, rich in vitamin C, calcium, riboflavin, niacin, iron, and phosphorus. Due to the high amount of fatty acids and liquid texture, a wide array of personal care products to nourish oily and dry skin are prepared from the seed oil of passion fruit. It increases vitality and improves hair growth. It can also be included in bath care products as it has a calming, sedating effect, and promotes relaxation. The oil is included in massage applications due to its anti-inflammatory, anti-spasmodic, and sedative properties [78].

4.32 *Petroselinum crispum*

This plant is generally considered a versatile herb that provides a concentrated source of nutrients. Rice in vitamins, minerals, and antioxidants helps boost the immune system and protect against illness. It also contains Flavonols (kaempferol and quercetin) and flavones (apigenin and luteolin). Additionally, it has anti-inflammatory properties that help in reducing puffiness and swelling. Many cosmetic industries use parsley to freshen the face, minimize discoloration, wrinkles, dark age spots, and freckles, prevent red sites, and strengthen hair. Several in vitro studies have shown that the herb has oil-controlling properties [79]. It can also be used as an antiseptic and can be used to treat acne. Parsley also has antimicrobial properties, which can help to protect the skin from infection.

4.33 *Theobroma cacao*

Cocoa beans are well-known, as they are rich in polyphenols. It contains carboxylic acid, phenolic acid, fatty acid, flavonoids (flavonol and flavones), stilbenoids, and terpenoids. Cocoa beans are a rich source of antioxidants and phytonutrients, linked to reducing inflammation, improving heart health, and promoting healthy blood sugar levels. They are also a good source of fiber and minerals such as magnesium, manganese, and zinc. To measure the antioxidant capacity of cocoa pods, a UHPLC extraction method was used to extract from cocoa pods that shows the quantification of the total polyphenols and flavonoids present in the cocoa pods. This method allowed researchers to determine cocoa beans' antioxidant capacity and their beneficial effects on the human body. To assess the impact of pod extract on skin whitening, elastase assays, collagenase assays, and sun screening tests were conducted to determine if they would inhibit the action of skin-degrading enzymes, and mushroom tyrosinase assays were performed to determine if they would impede the movement of skin-degrading enzymes. The elastase, collagenase, and sun screening assays showed that the pod extract had an inhibitory effect on skin-degrading enzymes, indicating that it could have a whitening effect. The results of the mushroom tyrosinase assay showed that the pod extract inhibited the activity of the mushroom tyrosinase, which further supported the idea that it could potentially have a whitening effect. The study results revealed that cocoa extract had antioxidant properties and showed a more decisive action against enzymes such as elastase and collagenase than other extracts. This is important because these enzymes can break down collagen and elastin, essential proteins that keep skin looking firm and youthful. By inhibiting the activity of these enzymes, the cocoa extract could help to protect the skin and reduce the signs of aging. Despite its limited performance as a UVA sunscreen agent, CPE also showed potential as a UVB sunscreen. The cocoa extract contains a type of polyphenol known as catechin polyphenols (CPE). Polyphenols have been shown to inhibit certain enzymes that break down collagen and elastin. By inhibiting these enzymes, CPE helps protect the skin from damage and reduce the signs of aging. In addition, CPE also has UVB protection properties, although its performance in this area is limited. CPE was found to contain carboxylic acid, phenolic acid, fatty acid, flavonoids (flavonol and flavones), stilbenoids, and terpenoids when LCMS analysis was conducted [80]. There are scientific validations for using cocoa-derived phytoconstituents as a practical approach for skin protection [81]. Cocoa butter is a common ingredient in different skin moisturizers, but cocoa's beneficial effects on the skin may extend beyond its topical agent. According to some studies, it has been found that cocoa flavonoids protect the skin from UV damage caused by the sun's UV rays [82]. Cocoa flavonoids contain antioxidants that have been found to reduce inflammation and improve skin elasticity. The appearance of dark spots and wrinkles is also reduced. In addition, these flavonoids can help protect against further skin damage caused by UV rays.

4.34 *Psidium guajava*

Guava is a tropical fruit full of nutrients and contains fibers, vitamin C, and folic acid. The leaves have inflammatory action and potent antibacterial activity. Acne and black spots can be eliminated with guava leaf extract. Guava leaves blended with water can be used as a scrub to remove blackheads. Due to its antioxidant properties, it protects the skin from damage and improves texture, skin tone, and skin tightening. The leaves can also give an instant cure for itchiness as they contain allergy-blocking compounds. An evaluation was done with the essential oil of guava against four dermatophytes, namely, *Microsporium canis, Trichophyton rubrum*, *T. tonsurans,* and *T. verusossum,* that were isolated from the infected part of the nail, skin, scalp, and genital organs of patients from the district hospital of Bareilly. Excellent inhibitory effects were given by the oil against all the pathogenic dermatophytes [83]. It has also been reported that aqueous extracts of guava leaves inhibit the growth of pathogenic microbes like *Proteus mirabilis,* *Streptococcus pyogenes, Escherichia coli, Staphylococcus aureus,* and *Pseudomonas aureginosa,* which is more effective than the organic extracts. These results also suggest that aqueous extracts can be used as a natural antibacterial agent, providing a potential alternative to synthetic antibiotics. More research is necessary to confirm the efficacy of this method. Furthermore, the extract acne can also be used to formulate oral antibacterial drugs that are used to treat surgical and skin infections [84]. Extracts from medicinal plants can treat many bacterial infections and may provide an effective alternative to synthetic antibiotics. Further research is needed to confirm the efficacy of this method. Various herbal plants containing different metabolites and their uses are mentioned below in Tables 2, 3, and 4.

5 Conclusion

Phytoherbal remedy is an art of healing with plant-based medicine, penetrating deeply into Indian culture. With new emerging technology and modern medicinal practices, people from every part of the world depend on herbal healing. It is increasing daily due to its admiration, lower cost, less toxicity, few side effects, and widespreadness in our natural ecosystem. Moreover, to fulfill the needs of the growing human population and their deteriorating health conditions, nature is contributing an immense amount of herbs for the survival of human beings and other organisms on the planet. Phytomedicines provide tremendous options for curing various skin infections. Different herbal medicines have been tested against skin infections like rashes, acne, eczema, psoriasis, pigmentation, fungal, viral and bacterial infections, skin cancers, inflammation, cuts, wounds, etc. In these presented chapters, there is a mention of different plant-based products, from tulsi, neem, jatropha, ginger, garlic, cucumber, grapes, pomegranate, cucumber, pumpkin, turmeric, tea, passion fruit, papaya, etc., to treat various skin problems. There are mentions of multiple phytoconstituents from those plants that help treat different skin remedies. Consequently, the demand for herbal cosmetics has been increasing tremendously. Healthy and natural skin maintenance has become vital as it may lead to many severe conditions. Cosmetics can be prepared from a single plant or combinations of plant parts and polyherbal formulations. These formulations can be further explored against harmful microorganisms that cause severe health hazards. A comprehensive screening of these natural herbs can be a new commanding and valuable target for developing herbal-based industries that tie up with pharmaceutical companies. The positive effects of herbal medicines may help researchers reduce skin infections and screen out newer leading molecules, appropriate approaches and new processes in drug discovery.

Table 2 Applications of herbal phytomedicines in skin disorders

Sl no	Common name	Botanical name and family	Useful against skin infections	Parts used
1	Neem	*Azadirachta indica*, Meliaceae	Leaves paste in treating acne, eczema, scabies, skin allergies, psoriasis	Leaves, barks
2	Licorice	*Glycyrrhiza glabra*, Leguminosae	Skin lightening, anti-inflammatory, depigmentation, atopic dermatitis, protect skin from UV radiation, and reduce melanin production, allergic dermatitis	Roots
3	Tulsi	*Ocimum santhum,* Labiatae	Cure rashes, scars, leucoderma, allergy, blisters, reduce inflammation, and boost immune system, cure chickenpox, insect bites, round worm infections	Leaves
4	Bitterweed	*Andrographis paniculata*, Acanthaceae	Eczema, leucoderma, cuts, and wounds	Aerial parts, roots, and leaves
5	Amla	*Embillica officinalis,* Euphorbiaceae	Treatment of warts, skin infections, and prevents premature aging, reduces itching, wrinkles, and scabies	Fruit
6	*Aloe vera*	*Aloe barbadensis,* Lilaceae	Helps in healing wounds, burns, sunburns, insect bites, cuts, itching swelling, scabies, and dandruff	Leaves
7	Papaya	*Carica papaya,* Caricaceae	Eczema, warts	Roots, pulp, bark, seeds, and peels
8	American purging nut	*Jathropha curcus,* Euphorbiaceae	Major skin lesions, wound healing	Fruits, seeds, and roots
9	Ginger	*Zingiber officinalis,* Zingiberaceae	Skin problems	Root and rhizomes
10	Eucalyptus	*Eucalyptus globulus,* Myrtaceae	Heals fungal infection, skin problems, and healing of wounds	Leaves
11	Asthma plant	*Euphorbia hirta,* Euphorbiaceae	Major wounds, boils, swelling, and acne	Root
12	Common fig	*Ficus carica,* Moraceae	Hyperpigmentation, wrinkles, itchy skin and skin irritation, eczema, skin ulcers, and acne	Fruits
13	Onion	*Allium cepa,* Amaryllidaceae	Skin allergy, anti-aging, scars, and stimulates blood circulation	Bulbs
14	Rosary Pea	*Abrus precatorius,* Fabaceae	Leucoderma, gray hair prevention, and wound healing property	Leaves
15	Carrot	*Daudus carota,* Apiaceae	Hair and skin moisturizer, eczema, and warts	seeds

(continued)

Table 2 (continued)

Sl no	Common name	Botanical name and family	Useful against skin infections	Parts used
16	Peppermint	*Menta piperata,* Labitae	Reduces dandruff and lice	Seeds
17	Beetroot	*Beta vulgaris,* Chinopodiaceae	Acne, psoriasis	Roots and leaves
18	Banana	*Musa paradisiaca,* Musaceae	Skin allergies, warts, poison ivy rashes, irritation, and inflammation	Peel and fruit
19	Avocado	*Persea americana,* Lauraceae	Psoriasis, wrinkles, and stretch marks	Fruit
20	Pot marigold	*Calendula officinalis,* Asteraceae	Anti-inflammatory	Flowers and leaves
21	Coffee	*Coffee arabica, C. canephora*	Wrinkles, firmness, and redness	Leaves
22	Cucumber	*Cucumis sativus,* Cucurbetaceae	Photoaging, skin disorders	Fruit
23	Garlic	*Allium sativum,* liliaceae	psoriasis, alopecia areata, keloid scar, and wound healing	Bulb
24	Grape	*Vinis vitifera,* vitaceae	Removal of fungal and viarl infections, leishmaniasis, control aging of skin, and rejuvenates skin	Berry
25	Pomegranate	*Punica granatum,* Lythraceae	Antioxidant	Seeds
26	Pumpkin	*Cucurbita maxima,* Cucurbetaceae	Aid in the healing process and exfoliators	Fruit
27	Tea	*Camellia sinensis,* Theaceae	Antiaging, antioxidant and astringent activity, and skin roughness (62)	Leaves
28	Turmeric	*Curcuma longa,* Zingiberaceae	Skin sebum secretion	Rhizomes
29	Saffron	*Crocus sativus,* Iridaceae	Melanin and erythema, management of melanoma	Flower
30	Strawberry	*Fragaria ananassa,* Rosaceae	Antioxidant, photoprotection	Fruit
31	Passion fruit	*Passiflora edulis,* Passifloraceae	Hair growth, treating dry skin, treating muscular aches, and swelling	Fruit seed
32	Parsley	*Petroselinum crispum,* Apiaceae	Removes dark age spots, face discoloration, freckles, wrinkles, and prevents red spot occurence, growing and strengthening hair, control oils	Leaves

Table 3 Constituents and mechanism of action of herbal plants [5, 6]

Sl no	Common name	Chief constituents	Mechanism of action
1	Neem	Azadirachtin, limonoides, vitamin C, glycerides, polyphenols, triterpenes, quercetin, chtechins, carotenes, and beta-sitesterol	The product contains essential fatty acids and during healing add moisture and texture to the akin thereby inhibiting the inflammatory cell growth
2	Licorice	Glycerrihizin, liquiritin	Tyrosin B16 inhibition of melanoma cells by dispersed tyrosin B16
3	Tulsi	Contanis ursolic acid, rosmarinic acid, oleanolic acid, linalool, carvacrol, β-caryophyllene, and eugenol	Blocks cylcoxygenase lipoxygenase pathways of arachidonic acid metabolism and immune response enhancement
4	Bitterweed	Diterpenes, lactones flavonoids, alkenes, ketonaldehydes, and andrographolide	It inhibits the inflammatory mediators nitrous oxide release (NO), interleukin (IL), and prostaglandin E2 (PGE2)
5	Amla	Ascorbic acid, polyphenols (ellagic acid, chebulinic acid, gallic acid, chebulagic acid, apeigenin, quercetin, corilagin, leutolin, etc.)	Inhibits adhesion of microbes, causes inactivation of enzymes. Influenza A virus suppression and prevention of viral absorption, treats HUV by inhibiting HIV-RT
6	*Aloe vera*	Anthraquinones, phenolics, flavonoids, chromones, anthrones, steroids, alkaloids and tannins anthraquinones, phenolics, chromones, anthrones, flavonoids, steroids, alkaloids, and tannins	The proliferation cells of skin, blood cells production, enhancement of elastin and collagen production, suppresses the immunity of skin, self-hydration of skin, and removal of dead skin cells due to penetration
7	Papaya	Papain, phenolic acids, chymopapain, cyanogenic glucosides, tocopherol, cystatin, glucosinolates, and vitamin C	Increases prothrombin, removes necrotic tissues
8	American purging nut	Tannins, flavonoids, phenols, saponins, lignoides, steroids, coumarins, terpenoides, and alkaloids	Phagocytosis of bacterial cells, during proliferative phase release of cytokine can cause the migration and division of cells

(continued)

Table 3 (continued)

Sl no	Common name	Chief constituents	Mechanism of action
9	Ginger	Carbohydrates, lipids, terpenes, and phenolic compounds	Cytokinin cyclooxygenase and nitric acid is inhibited, inhibits nuclear factor kappa B (NF-Kb) cells
10	Eucalyptus	Sideroxylonal C, (+)-oleuropeic acid, cypellocarpins A, B, and C, cypellogins A, B, and C, leptospermone, isoleptospermone, grandinol	Inhibits gram-negative and gram-positive bacteria by interaction of trichosolan with enzymes of the fatty acid pathway
11	Asthma plant	Alkaloides, flavonoids, terpenes, chromenes, and sterols from all the plant parts	Serum cholesterol triglycerides and urea reduction in alloxan-induced m ice, due to antioxidant and free radical scavenger
12	Common fig	Phenolic acid and flavonoides	Inhibits tyrosin, reduces melanin content
13	Onion	Kaempferol, muricetin, quercetin, quercitrin, and allyl sulfide	Inhibits ultraviolet B (UV-B), inhibits free radical scavenger.
14	Rosary Pea	Luteolin O-rutinoside, orientin, abrectorin, isoorientin, desmethoxycentaviridin-7-, abrusoside A to D, abrusogenin, glycyrrhizin, and abruquinones D, E, and F	Collagen synthesis enhancement through elevated hydroxyproline
15	Carrot	Beta carotene, fibrem vitamin K1, potassium, antioxidants, and lutein	Acts on epidermal cells
16	Peppermint	Essential oils of peppermint contains menthone and carbaryl esters, mainly menthyl acetate while dried peppermint contains volatile oil containing menthyl acetate, menthone, menthofuran, menthol, and 1,8-cineol	Improvement in the circulation of bold in scalp
17	Beetroot	Contains betalains (e.g., betaxanthins and betacyanins), saponins, flavonoids, inorganic nitrate, and polyphenols. It also contains sodium, potassium, phosphorus, calcium, magnesium, copper, iron, zinc, and manganese	–
18	Banana	Leucocyanidin (flavonoids)	Reduce skin irritation and inflammation
19	Avocado	Flavonoides, saponins, phenolics, tannins, alkaloids, hydroxybenzoic acid, catechin, chlorogenic acid, ferulic acid, coumaric acid, caffeic acid, and triterpenoid glycosides	Protect cells from free radical damage
20	Pot marigold	Adinol, carotenoids, isorhamnetin, saponins, triterpenes, sesquiterpenoids, scopoletin, flavonoids, quercetin, and kaempferol.	Effective scavenger of H2O2 radicals, change in malondialdehyde level, superoxide dismutase glutathione, ascorbic acid, and catalase

(continued)

Table 3 (continued)

Sl no	Common name	Chief constituents	Mechanism of action
21	Coffee	Chlorogenic acid	Reduce redness on skin due to ultraviolet exposure, increase apoptosis (programmed cell death)
22	Cucumber	Alkaloids, flavonoids, and a cyanogenic glycoside	Skin sebum secretion
23	Garlic	Alliin, methiin and S-allylcysteine, and allicin	Immunologic properties, cutaneous microcirculation, and protection against UVB
24	Grape	Presence of phenolic acids, flavon-3-ols, myrcetin, flavonols, flavonoids, resveratrol, quercetin, tannins, ellagic acid, kaempferol, anthocyanins, cyaniding, and proanthocyanidins peonidin	Skin protection against UVB radiation, antioxidant, antiaging, and skin tightening
25	Pomegranate	Gallic acid, ellagic acid, punicalagins, and punicalins	Antioxidant potential
26	Pumpkin	Carotenoides, polysaccharides, paraaminobenzoic acid, fixed oils, peptides, proteins, sterols, and γ- aminobutyric acid.	Exfoliation accelerator, activation of cell turnover
27	Tea	Catechins, theaflavins, quercetin, L-Theanine, GABA, statin, and aromatic volatiles	Antioxidant and astringent activity
28	Turmeric	Saponin, alkaloid, sterol, tannin, flavonoid, phytic acid, and phenol.	Skin sebum secretion
29	Saffron	Crocin, Picrocrocin, and safranal	Change in the levels of skin erythema and melanin, management of melanoma
30	Strawberry	Vitamin C, manganese, folate, potassium, antioxidants, polyphenols, anthocyanins, and vitamins. Anthocyanins, ellagic acid, and flavonols	Photoprotective capacity, increasing cell viability
31	Passion fruit	Riboflavin, niacin, iron, and phosphorus	Anti-inflammatory, anti-spasmodic, and sedative properties
32	Parsley	Flavonols (kaempferol and quercetin), flavones (apigenin and luteolin)	Control oil secretion on the skin
33	Cocoa bean	Carboxylic acid, flavonoids (flavonol and flavones), stilbenoids, fatty acid, phenolic acid, and terpenoides	Higher inhibition toward tyrosinase enzyme, shows better action against collagenase and elastase enzymes
34	Guava	Fibers and vitamin C, Folic acid	Destroy the free radicals that damage skin

Table 4 List of some other phytomedicines

Sl no	Skin care products	Scientific name and family	Phytoconstituents	uses	Reference
1	Coconut oil	*Cocos nucifera*, Arecaceae	Glycerides and lower chain fatty acids	Baking and cooking, used as hair oil	[89]
2	Sunflower oil	*Helianthus annuus*, Asteraceae	Lecithin, tocopherols, carotenoids, and waxes	Products prepared for face and body	[90]
3	Jojoba oil	*Simmondsia chinenesis*, Simmondsiaceae	Linear liquid wax esters, alcohols, fatty acids, sterols, and vitamins	Used as moisturizer exotic fragrances carrier oil, removes odor	[91]
4	Olive oil	*Oleaeur opaea*, Oleaceae	Triolein,tripalmitin, trilinolein, tristearate, monosterate, triarachidin,squalene, β- sitosterol, and tocopherol	Skin and hair conditioners like lotions, shampoos, etc.	[85]
5	Rhodiola rosea	*Lignum rhodium,* Crassulaceae		Enhance physical endurance, increase in work productivity, longevity, resistance to high altitude sickness, treatment of fatigue, anxiety, anemia, impotence, gastrointestinal problems, skin disorders and infections, and nervous system disorders	[92]
6	Ginkgo	*Ginkgo biloba*, Ginkgoaceae	Glycosides, mostly quercetin and kaempferol derivatives, and terpenes	Antioxidant, anti-inflammatory, reduce UBV sunrays	[93]
7	Henna	*Lawsonia inermis*, Lythraceae	Gallic acid, resin, mannitol, fats, mucilage, glucose, and alkaloid traces	Henna powders are produced for hair application and mehendi designs on hands and legs	[94]
8	Shikakai	*Acacia concinna*, Leguminosae	Saponins, flavonoids, tannin, alkaloid, sugar, and anthraquinone glycosides	Hair cleaning and washing, hair growth improvement, purgative, expectorant, and emetic	[95]
9	Tamarind	*Tamarindu syndical*, Fabaceae	Rich source of sugars, contain minerals and excellent source of vitamin B, contains high antioxidant phenolic compounds	Improves skin health	[96]

Acknowledgment We would like to extend our sincere appreciation and gratitude to the Department of Agronomy & Plant Pathology at the School of Agriculture at Lovely Professional University, Punjab, 144411, India.

Metabolites and Phytochemicals in Medicinal Plants Used in the Management and Treatment of Neurological Diseases

19

Okon Godwin Okon

Contents

Abstract

In medicine, neurological disorders can be well defined as disorders which affect the brain and nerves found all through the body of humans as well as the spinal cord. Structural, biochemical or electrical abnormalities in terms of biochemistry,

S. C. Izah et al. (eds.), *Herbal Medicine Phytochemistry*, Reference Series in Phytochemistry, https://doi.org/10.1007/978-3-031-43199-9_22

electrical or structure in the brain, spinal cord or other nerves can lead to a range of symptoms. Some good examples of such symptoms include poor or loss of coordination and sensation, seizures, muscle weakness, paralysis, pain, confusion and an altered sense of consciousness. There are many causative factors when it comes to neurological disorders, this may include lifestyle, genetics, congenital abnormalities, brain injury, infections and nerve and spinal cord injuries. Neurological disorders include but are not limited to the following: Alzheimer's disease, brain aneurysm, epilepsy and seizures, meningitis, multiple sclerosis, muscular dystrophy, Parkinson's disease, stroke, migraine, headaches and encephalitis. Plants used in the treatment and management of neurological disorders include *Andrographis paniculata*, *Areca catechu*, *Centella asiatica*, *Sesamum indicum*, *Cinnamomum cassia*, *Euphorbia tirucalli*, *Piper methysticum*, *Areca catechu*, *Angelica sinensis*, *Centella asiatica*, *Aegle marmelos*, *Gardenia jasminoides*, *Tripterygium wilfordi*, *Xylopia aethiopi*, *Curcuma longa*, *Panax ginseng*, *Garcinia kola*, *Glycine max*, *Schizandrae chinensis*, *Ginkgo biloba*, *Piper nigrum*, *Withania somnifera*, *Cyperus rotundus*, *Suctellaria baicalensis*, *Silybinisus laborinum*, etc. these plants possess some key phytochemical groups such as Phenolics, alkaloids, saponins, flavonoids, triterpene, glyco withanolides, sesquiterpenes, lignans, neolignans, etc. While the active constituents/metabolites include curcumin, wogonin, flavonoid, silibinin, stilbenoid/resveratrol, hyperforin, rutin, ferulic acid, paeoniflorin, safranal, crocin, naringenin, berberine, chrysin, thymoquinone, nardostachysin, jatamansic acid, jatamansone, etc. These phytochemicals have been reported by many researchers to possess and exhibit neuroprotective properties. The plants discussed in this chapter as well as their active constituents provide great insight into affordable means of treating and managing neurological disorders as well as a basis for pharmaceutical companies searching for novel sources for the production of neuroprotective pharmacotherapy drugs.

1 Introduction

Neurological diseases or disorders can be described as diseases/disorders which particularly affect or disturb the brain, spinal cord as well as nervous coordination which run throughout the human body. Distortions or abnormalities which can be biochemical, structural or electrical as the case may be in the brain, nerves or spinal cord can create an assortment of symptoms. These symptoms include seizures, poor coordination, paralysis, confusion, muscle weakness, altered levels of consciousness, loss of sensation and pain [1].

There are a great number range of specific causes of neurological diseases/ disorders. The prominent of these causes are genetic disorders, contagions, deformities or disorders, malnutrition which could be linked to the health of one's environment, lifestyle, serious injuries to the brain, nerves as well as the spinal cord are also amongst the common causes of neurological diseases.

Let's also note that there's a big difference between neurological disorders and mental disorders (which could also be referred to as psychiatric illnesses, mainly deformities of ones way of thinking, behaviour as well as feeling ultimately resulting in anguish or diminishing of function). On the other hand, there are numerous neurological diseases, very few are rare ones while others are very common [1]. Figures from the US National Library of Medicine put the number of neurological disorders at 600.

Disabilities associated with neurological diseases/disorders are numerous, including cerebral palsy, brain tumours, epilepsy, autism, learning disabilities, ADD and neuromuscular disorders. A few of these disorders appear from childbirth thus making them congenital. Aside neurological diseases being congenital, some are actually caused by trauma, physical defects, tumours, degeneration and contagions all of which causes injury to the nervous system which will ultimately determine the magnitude of vision, communication, cognition, movement and hearing impairment [1].

The use of several synthetic agents and medication with neuroprotective properties has been properly documented. However, there are some discomforting side effects associated with these synthetic neuroprotective medications which include fretfulness or nervousness, fatigue, dry mouth, tiredness, drowsiness, struggle with balance, etc. However, the use of plants and herb with neuroprotective properties in recent times has gained prominence globally. This has led many plant scientists globally to focus on and research more into the metabolites and phytochemicals present in the said plants and their mechanism of neurological moderation and neuroprotective conferment against neurodegeneration.

Plants used in the treatment and management of neurological diseases and disorders include but are not limited to *Andrographis paniculata*, *Areca catechu*, *Centella asiatica*, *Sesamum indicum*, *Cinnamomum cassia*, *Euphorbia tirucalli*, *Piper methysticum*, *Areca catechu*, *Angelica sinensis*, *Centella asiatica*, *Aegle marmelos*, *Gardenia jasminoides*, *Tripterygium wilfordi*, *Xylopia aethiopi*, *Curcuma longa*, *Panax ginseng*, *Garcinia kola*, *Glycine max*, *Schizandrae chinensis*, *Ginkgo biloba*, *Piper nigrum*, etc. Some key phytochemical groups in the plants listed above include Phenolics, alkaloids, saponins, flavonoids, triterpene, glyco withanolides, sesquiterpenes, lignans, neolignans, etc. While the active constituents/metabolites include curcumin, wogonin, flavonoid, silibinin, stilbenoid/resveratrol, hyperforin, rutin, ferulic acid, paeoniflorin, safranal, crocin, naringenin, berberine, chrysin, thymoquinone, nardostachysin, jatamansic acid, jatamansone, etc.

According to Phani et al. [2], saponins, phenolic acids, flavonoids, polyphenols, terpenoids, etc. are regarded as the most essential phytochemicals from dietary sources. These phytochemicals work by decreasing or by retrogressive cellular injury and by decelerating advancement of neuronal cell loss.

This chapter with explicitly discuss the numerous medicinal plants that have been used in the management of neurological diseases and disorders globally already. It will also highlight the phytochemical groups and bioactive constituents/metabolites and their mechanism of neurological moderation and neuroprotective conferment against neurodegeneration as well as providing the basis for pharmaceutical companies searching for novel sources for the potential production of neuroprotective pharmacotherapy drugs.

2 Types of Neurological Diseases

Several disorders of the nervous system exist, which require professional healthcare physicians. Some of these disorders include: Alzheimer's disease, brain aneurysm, epilepsy and seizures, meningitis, multiple sclerosis, muscular dystrophy, Parkinson's disease, stroke, migraine, headaches, encephalitis, etc.

2.1 Alzheimer's Disease

According to John Hopkins Medicine [3], over 5.2 million people in America are affected with Alzheimer's disease particularly those above 65 years of age as well as thousands under the said age as well. Alzheimer's disease which is also regarded as the most common form of dementia affects about two-thirds of women as well.

The motor function of Alzheimer's patients is not affected when compared to other forms of dementia until in the later stages. Common behaviours associated with Alzheimer's disease include [3]: language descent, misperception, diminished memory, behaviour and thinking, agitation, compromised judgement, diminished ability to communicate, changes in behaviour and personality, impaired awareness, incapability to think of following directions and emotional indifference.

2.2 Brain Aneurysm

This (brain, intracranial or cerebral aneurysm) can be defined as a ballooning effect or swelling which occurs as a result of the weakening in a particular area specifically in the wall of the brain's blood vessel. Brain aneurysms usually do not show any symptoms and are insignificant in size (10 mm) and are usually not noticed until rupturing occurs. The smaller the aneurysm, the lower the risk and chances of rupturing [3].

More so, sentinel haemorrhage which occurs sparingly may show symptoms before rupture. This is as a result of a small quantity of blood leakage into the brain. These aneurysms symptoms arise sometimes because of the pressing on other adjourning structures like the eye nerves which results in a loss of vision and suspension of eye movement [3]. Some of the symptoms of an unruptured brain aneurysm include change in vision, reduced eye movement, headaches and pains in the eyes.

2.3 Epilepsy and Seizures

Epilepsy happens to be the utmost common neurological disorder which affects patients regardless of background, race or age. According to John Hopkins Medicine [3], over

2.2 million people in America live with epilepsy. Epilepsy is a nervous system disorder that involves the brain, thus making the patients vulnerable to repeated seizures.

One is described as epileptic or having epilepsy if he/she has two or more seizures. However, seizures may be caused by several factors that may disturb the networks between the brain and nerve cells such as concussion of the brain, alcohol, drug withdrawal, high/low blood sugar, high fever, etc. a few of the major causes of epilepsy include strokes, tumours, brain damage caused by either injury or illness, and disproportion in neurotransmitters.

2.4 Meningitis

An inflammation or swelling of the meninges results in the disease meningitis. Meninges here are the three layers that surround and protect the brain and spinal cord. It is usually, an infection that results in the swelling of the meninges [3].

Meningitis caused by viruses is more severe and more of a threat to life than those caused by less common bacterial. Meningitis caused by viruses is usually transmitted via different forms such as pitiable hygiene, sneezing, coughing and sparingly through common insects like ticks and mosquitoes [3]. Some symptoms of meningitis include misperception, seizures, stiffness of the neck, sleepiness, extreme temperature, headache, vomiting, photophobia and pains in body joints.

Symptoms observed in children include: fever, difficulty waking, backache, vomiting, loss of appetite, agitated, loud cry and change in skin colour to pale.

2.5 Parkinson's Disease

Parkinson's disease is a very serious neurodegenerative disorder that is progressive and shreds away all motor capabilities consequently, reducing the balance in individuals usually above 65 years of age. Parkinson's disease is sometimes regarded as hereditary or occurs extemporaneously [3]. However, it is known that this disease may occur as a result of dead brain cells in the "substantia nigra" resulting in the termination of dopamine production, hence loss of muscle movement or control [3].

Recent researches are currently targeted at investigating genes responsible for Parkinson's disease as well as discovering new complex biochemical pathways which is involved in the disease for targeted therapy.

2.6 Stroke

Stroke happens as a result of the stoppage of blood flow to the brain which put the patient in an emergency state. Brain functions appropriately when there is adequate nutrient and oxygen supply, hence, stoppage of blood supply notwithstanding duration may create a lot of complications [3].

Loss of brain functions due to dead brain cells may result in the patient's inability to carry out the following functions [3]: movement, eating, making speech, remember or think, regulate bowel and bladder movement and regulate additional dynamic body functions.

Strokes occur unannounced without prior notice. Strokes are of two types: haemorrhagic and ischaemic stroke.

Risk factors of stroke include: 140/90 or higher blood pressure, chronic smokers, usage of contraceptives, patients with heart diseases, diabetes, elevated blood cholesterol, drug abuse, obesity, excessive alcohol intake, not exercising the body, old age (from 55 years), genetics and males are more at risk of having a stroke than women.

2.7 Migraine

The intensity of migraines can range from modest intensity to tremendously severe ones which are usually characterized by an excruciating beating feel. Often time migraines occur on one part but can also occur on a whole or either part of the head, face or neck [3]. Photophobia and sensitivity to smell and noise are associated with migraines while vomiting is one of the most common symptoms. Migraines can occur as a result of the following: excessive alcohol consumption, insomnia, loss of water due to dehydration, menstruation, grinding of tooth, extreme weather changes and starvation.

2.8 Encephalitis

This is caused by swelling of the brain's active tissues either caused by an autoimmune reaction or infection leading to serious swelling in the brain with resultant effects like photophobia, rigid neck, headaches, seizures as well as mental misperception [3].

Observed symptoms of encephalitis include photophobia, sound sensitivity, headaches, high body, temperature, fever, unconsciousness and stiffness of the neck.

3 Medicinal Plants Used in the Treatment of Neurological Disorders

Medicinal plant can be any plant in which one or more of its parts contains bioactive substances which can be used for therapeutic purposes or which are antecedents for the synthesis of useful drugs. Right from time immemorial, natural plant products have occupied a place of prime importance in the field of medicine. They continue to be vital to many who do not have access to modern medicines or cannot afford synthetic drugs. Medicinal plants, e.g., herbs, and trees contain chemical compounds known to modern and ancient civilizations for their bioactive properties. Until the development of chemistry, particularly, the synthesis of secondary metabolites in the nineteenth century, medicinal plants and herbs have been the sole source of bioactive compounds capable of healing human ailments. Researchers believe that if medicinal herbs are taken in the appropriate doses and forms, they will be more effective than modern pharmaceutical drugs (synthetic drugs).

Plant products contain secondary metabolites that heal a variety of ailments and conditions in humans and animals. Over three-quarters of the world's population rely mainly on plants and their products for primary healthcare. About 30% of the entire plant species worldwide, at one time or the other was used for medicinal values [4].

It has been estimated that in developed countries like the USA, plant drugs constitute as much as 25% of the total drugs. Fast developing countries such as China and Singapore, their contributions are as much as 80%. Therefore, the economic uses of medicinal plants are much more in countries such as China than the rest of the world. These countries provide two-third of the plants used in modern systems of medicine and the health care delivery of rural population depends on indigenous systems of medicine. Of the 250,000 higher plant species on earth, more than 80,000 have medicinal purposes [5].

Current reviews and research have shown that there are a lot of medicinal plants with several phytochemicals which have been reported to decline neuropathy in animal models of CIPN. Curcumin, rutin, quercetin, matrine, euphol, thioctic acid, rosmarinic acid and cannabinoids are the most relevant natural products with therapeutic effects in CIPN [6] (Table 1).

4 Medicinal Plants, Bioactive Compounds/Phytochemicals and Mechanisms of Action

4.1 *Panax ginseng*

This medicinal plant is well known for its numerous healing properties and it is indigenous to the Chinese/Koreans. The plant has been credited with the ability to aid patients resist sicknesses by boosting the patient's immune system and has been used in the treatment of several illnesses including neurodegenerative disorder, diabetes, cancer, hypertension, etc. According to a research by Nah et al. [51], the active compound found in *Panax ginseng* ginsenoside, which is a saponin, has the potential to impede voltage-dependent Ca^{2+} channels linked by a G protein receptor sensitive to the Ca^{2+} which modulates neuronal Ca^{2+}. The neuroprotective effect of ginsenoside occurs when it acts on dopaminergic neurons by impeding the promotion of the nigral iron level, thus dropping expression of divalent metal transporter (DMT1), elevating ferroportin (FP1) expression in Parkinson's disease's patient [52].

4.2 *Ginkgo biloba*

Ginkgo biloba is widely used as a plant supplement with great build-up of bioactive compounds such as bilobalide, ginkgolides A, B, and C, quercetin,

Table 1 List of medicinal plants in the treatment of neurological disorders

Botanical names	Common Names	Family	Bioactive compounds/ phytochemicals	Mechanism of action/effects	References
Andrographis paniculata	King of bitters	Acanthaceae	Diterpene lactone and Andrographolide	Decreases of aggregation of platelet. Increases endothelial nitric oxide synthase (eNOS) activity	[7]
Areca catechu	Areca, Betel-nut Palm, Pinang	Arecaceae	Alkaloids, Arecoline, Guvacine, Arecaidine	Involvement in the binding activity of muscarinic (M2)	[8, 9]
Sesamum indicum Linn	Sesame	Pedaliaceae	Sesamol	By improving cognitive functions and the reduction of oxidative stress	[10, 11]
Cinnamomum cassia	Chinese cinnamon or cassia	Lauraceae	Coumarin	Reduces cold allodynia	[12]
Euphorbia tirucalli	Milk bush	Euphorbiaceae	Euphol	Reduces persistent and mechanical hypersensitivity	[13]
Piper methysticum	Kava	Piperaceae	Kavain, Yangonin, Kavalactones, Methysticin	Modulation of γ-aminobutyric acid type A (GABAA) receptors	[14]
Angelica sinensis	Garden angelica	Apiaceae	Ferulic acid	Involvement in antioxidant action	[15]
Centella asiatica	Indian pennywort	Apiaceae	Asiatic acid/triterpene	Protects against dysfunction caused by 3-nitropropionic acid (3-NP). Decreases acetylcholinesterase (AChE) and involvement in antioxidant activity	[16, 17]
Aegle marmelos	Bilwa or bael	Rutaceae	Alkaloid-amide and Aegeline	Reduces reactive oxygen species (ROS)	[18]
Gardenia jasminoides	Common gardenia or cape jasmine	Rubiaceae	Crocin/carotenoid	Decreases acetylcholinesterase (AChE) and oxidative stress	[19]

Tripterygium wilfordii	Thunder god vine	Celastraceae	Triptolide	Increases cognitive function, complemented by reduction in neuroinflammation and Aβ deposition as well as the improvement of memory	[20, 21]
Xylopia aethiopica	Spice tree	Annonaceae	Xylopic acid	Reduces inert motorized hyperalgesia	[22]
Curcumin longa	Turmeric	Zingiberaceae	Curcumin	Upsurge manifestation of brain neurotropic factor by the reversal of hippocampal neurogenesis caused by stress	[23, 24]
Panax ginseng	Ginseng	Araliaceae	Ginsenoside and triterpene glycosides	Promotion of hippocampal gamma-aminobutyric acid (GABA) level in the brain through the increased enzyme activities of glutamate decarboxylase. Reduces Ca^{2+}	[25]
Garcinia kola	Bitter kola	Clusiaceae	Kolaviron	Reduces necrotic cell death and myeloperoxidase (MPO)	[26]
Glycine max	Soybean	Fabaceae	Genistein and flavonoid	Reduces monoamine oxidase (MAO) and inflammation	[27, 28]
Schisandrae chinensis	Chinese magnolia vine	Magnoliaceae	Schizandrin	Plays a part in acetylcholinesterase (AChE) and γ-Aminobutyric acid type A (GABAA) receptors	[29]
Ginkgo biloba	Maidenhair trees	Ginkgoaceae	Ginkgolides, Gastrodin, Vanillin, Bilobalide	By promotion of hippocampal gamma-aminobutyric acid (GABA) levels.	[30]
Piper nigrum	Black pepper	Piperaceae	Piperine	Suppresses the actions of N-methyl-D-aspartate (NMDA) receptor	[31]
Withania somnifera	Indian Winter cherry	Solanaceae	Withanolides/Withanols/ Withamides/Withanone/Amido compounds	Stabilization of mood	[32]
Cyperus rotundus	Nut grass	Cyperaceae	α-Cyperone	Decreases of aggregation of platelet	[33]

(continued)

Table 1 (continued)

Botanical names	Common Names	Family	Bioactive compounds/ phytochemicals	Mechanism of action/effects	References
Scutellaria baicalensis	Huang Qin or Chinese skullcap	Lamiaceae	Wogonin/flavonoid	Decrease in monoamine oxidase A (MOA-A) and synthesis of thrombin	[34]
Silybinisus laborinum		Fabaceae	Silibinin	Decreases acetylcholinesterase (AChE) and reactive oxygen species (ROS)	[34, 35]
Vitis vinifera	Common grape	Vitaceae	Stilbenoid/Resveratrol	Decreases beta-amyloid plaques	[36]
Hypericum perforatum	St. John's wort	Hypericaceae	Hyperforin and Rutin	Decrease in monoamine oxidase A (MOA-A) and monoamine oxidase B	[37]
Paeonia lactiflora	Common garden peony	Paeoniaceae	Paeoniflorin	Controlling adrenergic systems	[38]
Crocus sativus	Saffron crocus	Liliaceae	Safranal, Crocin	By promotion of hippocampal gamma-aminobutyric acid (GABA) levels	[39]
Citrus paradise	Grapefruit	Rutaceae	Naringenin	Reduces the inflammation of cytokines	[40]
Citrus sinensis	Orange	Rutaceae	Naringenin	Reduces the inflammation of cytokines	[40]
Berberis genus	Barberry	Berberidaceae	Berberine	Decreases acetylcholinesterase (AChE)	[41]
Hypericum afrum	–	Hypericaceae	Flavonoid	Decrease in monoamine oxidase A (MOA-A)	[27]
Cytisus villosus	Brooms	Fabaceae	Chrysin	Decrease in monoamine oxidase A (MOA-A)	[27]
Nigella sativa	Black seed	Ranunculaceae	Thymoquinone	Upsurge in GABAergic tone via opioid receptor	[42]
Ficus platyphylla	Broad leaf fig	Moraceae	Saponin	Overturns excitatory and inhibitory synaptic traffic. Works by the suppression of excited synaptic traffic	[43]
Nardostachys jatamansi	Balachara	Valirenaceae	Nardostachysin, Jatamansic acid, Jatamansone	Enhances dopamine	[44]

Biota orientalis	Oriental arborvitae	Cupressaceae	Pinusolides	Confers neuroprotection	[45]
Camellia sinensis	Green tea	Theaceae	Epigallocatechin gallate/catechin	Decreases acetylcholinesterase (AChE) and reduces oxidative stress	[19, 46]
Valeriana officinalis	Garden heliotrope	Caprifoliaceae	Hesperidin/flavonoid	Reduces oxidative stress	[35]
Angelica gigas	Korean angelica	Apiaceae/ Umbelliferae	Decursin/pyranocoumarin	Decrease in monoamine oxidase A (MOA-A)	[47]
Galanthus nivalis	Snowdrop	Amaryllidaceae	Galanthamine	Inhibits acetylcholinesterase AChE	[48]
Gastrodia elata	Tian ma	Orchidaceae	Gastrodin	GABA transaminase inhibition	[30]
Ziziphus jujube	Common jujube	Rhamnaceae	Spinosin, Jujubosides	Reduction of hippocampal hyper-action	[49]
Allium sepa	Onions, shallots	Alliaceae	Allium and Allicin	Activation of sulphides containing allyl conveys neuroprotective properties by the initiation of mitochondrial uncoupling proteins	[50]
Allium sativum	Garlic	Alliaceae	Allium and Allicin	Activation of sulphides containing allyl conveys neuroprotective properties by the initiation of mitochondrial uncoupling proteins	[50]
Ocimum sanctum	Tulsi	Lamiaceae	Essential oils	Involvement in dopamine functions	[2]
Rubia cordifolia	Common madder	Rubiaceae	Terpenoids	Increases gamma-aminobutyric acid (GABA) levels	[2]
Cymbopogon citratus	Lemongrass	Gramineae	Essential oils	Increases gamma-aminobutyric acid (GABA) neurotransmission	[2]
Salvia lavandulaefolia	Spanish sage	Lamiaceae	α-Pinene, 1,8-cineole β-Pinene	Inhibits acetylcholinesterase AChE	[2]

isorhamnetin, kaempferol, etc. *Ginkgo biloba* has been reported to have positive effects on neuropathy (vincristine-induced) [53]. Research also shows the impeding properties of *Ginkgo biloba* through the nitrosative- and oxidative-induced neural damage on diabetic neuropathy in animal model [54]. Reports by Taliyan and Sharma [55] also show ginkgolide B regulation of neural damage via cellular pro-apoptotic pathways.

4.3 *Curcuma longa*

Curcuma longa also known as turmeric is known for its numerous benefits and medicinal properties. In relation to neurodegenerative disorder, curcumin found in *Curcuma longa* has been reported to be beneficial in management and treatment of the disorder. Xu et al. [56] reported curcumin benefits which includes betterment of behavioural deficits and protects the neurons against ischemic cell death as observed in animal models. Other researches have also reported that curcumin has been used in in vitro treating of age-related neurodegenerative diseases. Lingering stress-induced damage of hippocampal neurogenesis has been reportedly upturned by curcumin as well as the potential to increase the manifestation of brain-derived neurotrophic factor (BDNF) [56, 57].

4.4 *Allium sativum* and *A. sepia*

Allium sativum (garlic) and *A. sepia* (onions) belongs to the family Alliaceae. They possess high quantity of allium and allicin (organosulphur compounds) which have been reported to have positive effects on neurodegenerative disorders and free radical foraging actions. Activation of sulphides containing allyl conveys neuroprotective properties by the initiation of mitochondrial uncoupling proteins [50].

4.5 Camellia sinensis

Camellia sinensis also referred to as tea, in which the popular black and green teas are produced from depending on their degree of fermentation. This plant is a great source of polyphenolics. Phytochemicals and other bioactive compounds found in *Camellia sinensis* include flavonoids (aflavins) and catechins (epicatechin, gallocatechin, epigallocatechin-3-gallate (EGCG), epigallocatechin) all of which drops chemotherapy-associated dose-preventive side effects in the early stage of therapy [58]. ECCG has been reported in neurological disturbances studies in many models as a result of its antioxidant and anti-inflammatory properties [59, 60].

5 Chemical Structures of Bioactive Compounds/Phytochemicals Found in Plants Used in the Treatment and Management of Neurological Disorders

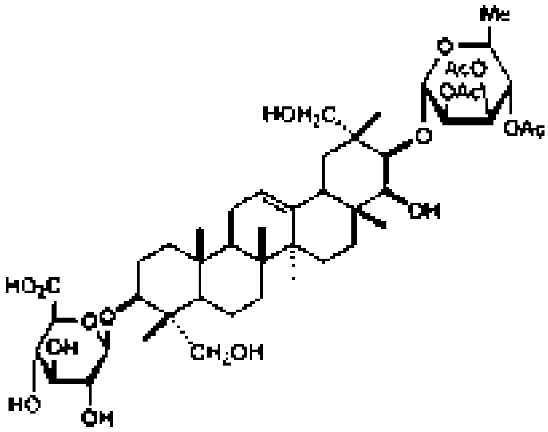
6 Conclusion

Neurological diseases or disorders can be described as diseases/disorders which particularly affect or disturb the brain, spinal cord as well as nervous coordination which run throughout the human body. There are a great number of specific causes of neurological diseases/disorders. The prominent of these causes are genetic disorder, contagions, deformities or disorders, malnutrition which could be linked to the health of one's environment, lifestyle, serious injuries to the brain, nerves as well as the spinal cord are also amongst the common causes of neurological diseases. The use of several synthetic agents and medication with neuroprotective properties has

Fig. 28 Triterpene glycosides (*Panax ginseng*)



been properly documented. But there are some discomforting side effects associated with these synthetic neuroprotective medications which include fretfulness or nervousness, fatigue, dry mouth, tiredness, drowsiness, struggle with balance, etc. This chapter has reviewed a lot of medicinal plants with several phytochemicals and their mechanism of actions which have been reported to decline neuropathy. The plants discussed in this chapter as well as their active constituents provide a great insight into affordable means of treating and managing neurological disorders as well as a basis for pharmaceutical companies searching for novel sources for the production of neuroprotective pharmacotherapy drugs.

Contents

Abstract

Diabetes is a cluster of prevalent hormonal conditions that display abnormally high blood glucose level. Diabetes is caused by the improper utilization of insulin by body cells or absence of pancreatic synthesis of insulin. Diabetes management involves measures used in maintaining diabetic condition to be close to normoglycaemia. This includes the use of medications such as insulin therapy and oral antidiabetic agents, exercise, weight loss, diet, and natural remedies. 65–80% of people worldwide use herbal medicine for their main medical care, which entails using medicinal plants to treat, diagnose, and prevent illnesses. Due

to their accessibility and alleged absence of adverse effects, most people, especially those who live in developing nations, prefer to treat their diabetes with medicinal plants including fenugreek, cinnamon, bitter lemon, and *Gymnema sylvestre*. Since many of these plants inhibit amylase, encourage insulin secretion, and aid in glucose uptake, they have similar antidiabetic effects to those of common oral antidiabetic drugs. There have been efforts to isolate bioactive components in antidiabetic plants as well as comprehending how they work due to the recent increase in interest in medicinal herbs and technological advances.

1 Introduction

Diabetes is an enduring metabolic ailment branded by high blood glucose levels [1]. There are approximately 422 million diabetics in the world, and this figure is steadily rising [1]. Either insufficient pancreatic insulin synthesis or inappropriate insulin use by body cell is to blame for the disorder [2]. It is regarded as the foremost causes of illness and mortality [3] and can cause several consequences, such as cardiovascular disease, renal failure, blindness, as well as amputation [2]. Dietary vicissitudes, insulin treatment, and oral hypoglycaemic drugs are typical management options for diabetes [1]. Herbal medicine has been utilized for ages to treat diabetes and has lately grown in favour of supplemental therapy [1]. The utilization of phytotherapy in the management and prevention of diabetes is examined in this chapter. Diabetes has long been treated with herbal medicines in conventional healthcare systems of Chinese (TCM) and Indian (Ayurveda) [4]. Herbal remedies work in a variety of ways, including by improving insulin sensitivity and glucose absorption [4].

2 Herbal Medicine

2.1 The Herbal/Traditional Medicine Structure

Traditional medicine, commonly known as complementary and alternative medicine (CAM), includes an array of procedures and approaches, including the use of therapeutic exercises, spirituality, and medicinal herbs for treatment, prevention, and maintenance of health [5]. Due to regional variations in historical, economic, and lifestyle circumstances, these behaviours, which are grounded on ideas and knowledge, fluctuate significantly from one place to another [6]. Traditional folk medicine has been practised and improved upon since the Stone Age [7]. The theory and practice of traditional medicine are said to work together to diagnose, treat, and prevent ailments. It is based on earlier information and discoveries that were frequently shared verbally through oral tradition, oral lessons from ancestors, or more recently, written down [7, 8]. The most prevalent kind of treatment in contemporary medical settings is the usage of medicinal plants or herbal medications [9].

Herbal remedies are frequently used in conventional medicine, which emphasizes their important place in ethnomedicine [10]. The investigation of pharmacognosy and the use of herbal plants is the foundation of conventional medicine [11, 12], which is known as herbal medicine also referred to as phytomedicine or phytotherapy [13]. Herbal medicine, phytotherapy, and phytomedicine are additional names for the research on pharmacognosy and the use of herbal plants, which is the cornerstone of contemporary medicine [14]. The WHO claims that herbal remedies are pharmaceuticals that have undergone processing and labelling and are utilized to cure illness or enhance life's quality. They include active compounds found in above- (e.g. seed, flower, leaf, and bark) or below-ground plant components (e.g. root, rhizome) or certain combinations of plant parts [15, 16]. Traditional Chinese herbal medicine and Ayurveda are the most well-known and widely used traditional healthcare systems [17, 18]. Among these systems are the following:

- System of Traditional African Medicine

  Traditional African medicine encompasses a range of conventional medical practices, such as native herbalism and African theology, and often involves the involvement of shamans, midwives, and herbalists [19]. Shamans, midwives, and herbalists are frequently involved in traditional African medicine, which includes a variety of Western medicinal techniques such native herbalism and African religion [19]. Ancient healing magic may be more common than Western medicine [7] and has a longer history and wider prevalence on the African continent than other traditional medical practices [20]. Different specialties of African traditional medicine, which is a complete healthcare system, include divination, spiritualism, and herbalism. However, in some circumstances there might be some overlap [7, 21].

  An individual who practises medical care in their tribe by utilizing methods such as herbs, minerals, animal parts, and incantations, among others, in accordance with their community's traditions and beliefs is known to be a traditional therapist/healer [7]. They should be considered as skilled, experienced, adaptable, and trustworthy [22]. Depending on the culture, there may be various classifications of traditional healers, including high priests, herbalists, midwives, priestesses, diviners, seers/spiritualists, and witch doctors [7]. In certain societies in Nigeria, these individuals are identified by their native names, such as *Babalawo*, *Buka*, or *Dibia* [23]. It is believed in ancient African medicine that certain aspects of the practice are only shared with initiates. Therefore, to gain access to these components, initiation into a cult is usually required [7]. According to this form of medicine, illnesses are caused by spiritual forces rather than random chance. As a result, the prescribed remedy typically involves a plant-based treatment that is believed to possess therapeutic qualities as well as symbolic and spiritual significance [7].

- Traditional Chinese Medical System

  Traditional Chinese medicine (TCM) is a complementary medical methodology that originates from Chinese traditional medicine [24]. TCM encompasses a wide range of health and therapeutic practices that are typically viewed as incompatible. These practices include traditional beliefs, intellectual theories, Confucian ideology, herbal treatments, dietary interventions, physical activities, various medical specialties, and different schools of thought [25]. Traditional Chinese medicine (TCM) is based on the philosophy of yinyangism, which combines the *Yin Yang* theory and the Five Phases hypothesis [26]. This philosophy applies the concept of *yin* and *yang* to the human body, where the top and back are considered as *yang*, and the bottom is viewed as *yin* [27]. *Yin* and *yang* are also used to describe various biological processes and disease symptoms. For example, sensations of cold and heat are considered *yin* and *yang* symptoms [27]. Traditional Chinese medicine (TCM) includes a list of medications that are believed to address specific symptom clusters by enhancing either *yin* or *yang* [29]. Additionally, strict guidelines have been established for the order of actions, countermeasures, and other interactions among the Five Phases theory [28]. The *zàng-fû* concept is closely linked to each of these Five Phases tenets and significantly affects the TCM body model [28]. The Five Phases concept is frequently utilized in both diagnosis and treatment within TCM [28] (Fig. 1, Table 1).

  In traditional Chinese medicine, the vital energy of the body, known as *ch'i* or *qi*, is believed to flow through meridians that are linked to multiple organ systems and physical functions through forks [31]. Rather than focusing on structural

details, traditional Chinese medicine places greater emphasis on physiological processes such as digestion, respiration, and temperature regulation [32]. The perception of illness in this system is that it reflects an imbalance or disharmony in the operations or relationships of various elements, including *yin*, *yang*, *qi*, *xuê*, *zàng-fû*, meridians, and their interplay with the surroundings and the human body [27]. Traditional Chinese medicine (TCM) considers recognizing a "pattern of disharmony" to be a critical step in the diagnostic process, as it forms the basis of therapy [28, 33]. However, identifying various patterns, which is also known as "pattern discrimination," is considered to be the most challenging aspect to master within TCM [34].

- Traditional Indian Medical System

  Ayurveda is a type of complementary therapy, being a 2000-year-old tradition originated from India [35]. Although it has changed over time, its beliefs and methods, which include herbal medicines, dietary programmes, meditation, yoga, massage, enemas, laxatives, and medicinal oils, are frequently regarded as pseudoscientific [36, 37]. Samkhya and Vaisheshika are two philosophical ideas that served as the foundation for Ayurveda, as well as Buddhist and Jain principles [38]. Maintaining balance is the major goal of Ayurveda, and it is thought that stifling natural desires might make one sick [39]. In fact, according to Ayurveda, even suppressing a sneeze may result in shoulder ache [40]. Ayurveda places a strong emphasis on a number of elements, including healthy eating practices, enough sleep, and appropriate sexual behaviour [39]. The human body, according to Ayurveda, is made up of three components: *doshas*, which are humoral substances; *malas*, which are waste products; and *dhatus*, which are the body's tissues [40]. Ayurveda recognizes three primary physiological humours or *doshas*, namely, *Pitta*, *Kapha*, and *Vata* [41]. These *doshas*, collectively known as *tridosha*, are often associated with the nervous system by contemporary writers [41]. An individual's mental state can be influenced by the *doshas* in Ayurveda [42]. The dominance of any *dosha* impacts an individual's bodily composition (prakriti) and character, as each dosha possesses distinct qualities and performs specific tasks in the body and mind [42, 43] (Fig. 2).

Ayurveda considers an imbalance in both mental and physical *doshas* as a significant cause of illnesses [45]. To diagnose illnesses, Ayurveda employs eight diagnostic methods, which include examining the urine, stool, speech, touch, vision, tongue, appearance, and pulse [45]. In Ayurveda, physicians rely on the five senses to diagnose patients, and for example, they use hearing to observe breathing and speech [46]. Ayurveda emphasizes the study of the *marman* or *marma* points, which are points in the body that could be potentially lethal [46]. Contemporary Ayurveda primarily focuses on improving the body's metabolism, promoting effective elimination of substances, and enhancing longevity, while two of the original eight branches of Ayurveda concentrate on surgical procedures [46]. There is also a significant emphasis on exercise, yoga, and meditation in this approach [47]. To maintain good health, Ayurveda subscribes to the Dinacharya school of thought, which emphasizes following the natural rhythms of the brain for activities such as waking, sleeping, and working [48]. The Sattvic diet is recommended as a part of the dietary regimen. In addition, important hygiene practices include regular showers, teeth brushing, tongue scrubbing, oil pulling, caring for the skin, and cleaning the eyes [48].

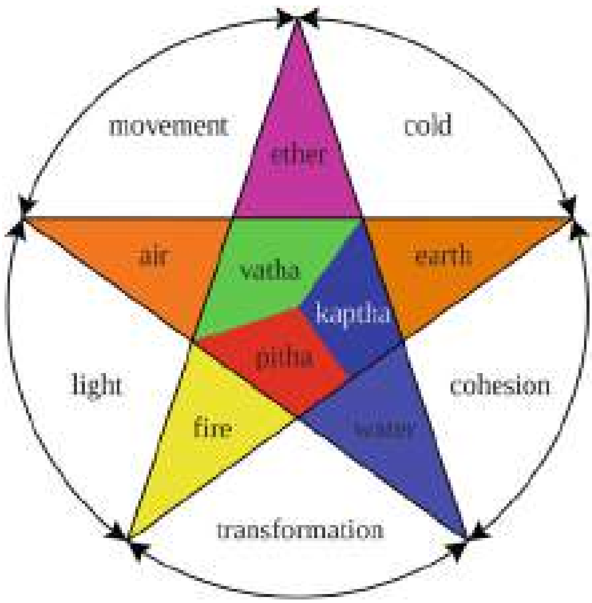

Fig. 2 The three *doshas* in Ayurveda are made up of five elements [44]

2.2 Herbal Preparation

There are different methods for preparing herbal remedies that vary based on regional and cultural practices. It is permissible to use both fresh and dried parts of plants, and a specific method is chosen based on experience to maximize effectiveness and minimize potential harm [7]. In general, there are several techniques for preparing herbal remedies, including:

(a) Extraction: The extraction method involves using a solvent in a specific weight-to-volume ratio. Sometimes, the solvent may evaporate and transform into a jelly-like substance [7].
(b) Infusion: To create an infusion, the plant materials are soaked in hot or cold water for a little while. Honey or another addition can be added to stop spoilage [7, 49].
(c) Decoction: It is created by making woody part of wood boil for a fixed period and then filtering out the solids. Potash can be used both as a preservative and to aid in the extraction process [49].
(d) Tincture: Tinctures, which are alcohol infusions, can be diluted before use if they are too concentrated [50].
(e) Ashing: Ashing involves burning the dry ingredients until they turn to ash, filtering the ashed samples, and then mixing them with water or food for consumption [7].

    There are several other types of herbal preparations. Lotions are thin treatments applied to the body, while liniments are surface treatments that come in watery, semi-liquid, or oily forms and contain bioactive ingredients [7]. Poultices are made from freshly macerated plant parts that retain their liquid and are applied to the skin [49]. Snuffs, which are made from powdered dried herbs, are burned to create charcoal and inhaled through the nose [7]. Gruels are grain-based cereals or porridges that are mixed with pulverized dried vegetables or their ash and consumed. Sometimes, mixtures of multiple plants are used to enhance the combined effects of the substances [49].

Aside from the usual methods of taking herbal remedies, such as orally, rectally, topically, or nasally, there are other ways to consume them. These include passive inhalation or smoking a poorly constructed cigar made of dried plant materials [7]. Another method involves inhaling the volatile oils released from heating or burning the plant matter [7]. These techniques can be helpful in relieving congestion, headaches, and respiratory issues. Sitz baths, however, are specifically used for treating piles [7, 51].

2.3 Prevalence of Use

Herbal treatments are a popular form of primary medical treatment worldwide, with estimates indicating that 65–80% of people use them [52]. Conventional medicine is responsible for about 40 percentage of medical services in China [53], and about 80% of African utilize conventional remedies to assist with healthcare difficulties [54]. As of 2018, the cases of herbal medicine usage varied across several cultural groups [55], and people's perceptions of herbal remedies are shaped by ancient traditions and lifestyle [56, 57]. For instance, the significant utilization of spices and herbs in Australian culture is recognized as a way to preserve food [57, 58]. According to data from the WHO, the use of phytomedicine was highest in European countries and Southeast Asia in 2019, at a rate of 91%, followed by Africa at 87%, and the lowest usage was in the America at 80% [6].

People who suffer from chronic illnesses such as HIV/AIDS [59], diabetes, asthma, end-stage kidney disease [60], and cancer [61] are more likely to use herbal remedies. Furthermore, several factors, including sex, age, race, level of education, and socioeconomic status, have been linked to the frequency of natural remedy usage [62]. Additional factors include arthritis, depression, anxiety, hypertension [63], and various chronic conditions [64, 65].

3 Diabetes Management

The principal aim of managing diabetes is to regulate sugar level as close to normoglycaemia, without causing it to drop too low [66]. To achieve this goal, individuals may need to make changes to their diet, engage in regular exercise, lose weight, and use medications such as insulin, oral medications, or herbal remedies [67].

Being well-informed about diabetes and vigorously partaking in treatment are imperative, as people who manage their blood sugar well have low risk of complication [68, 69]. Managing diabetes typically involves modifying one's diet, engaging in physical activity, losing weight, and using appropriate medications (insulin, oral, and herbal) [67].

The American College of Physicians recommends maintaining a target glycated haemoglobin (HbA1c) level of 7–8% for diabetes treatment [70]. Health conditions including high blood pressure, obesity, metabolic syndrome, as well as physical idleness can exacerbate the negative effects of diabetes [71].

The same principles for controlling diabetes can be applied to the general population, but interventions may need to be tailored to specific populations. Further research is necessary to determine if self-monitoring is effective for individuals with serious mental illnesses as well as type 2 diabetes and if the outcomes are comparable to those seen in the general population [72].

3.1 Medication

To be effective, most treatments for diabetes work by reducing glucose levels in different ways [73]. It is widely accepted that maintaining tight control over blood glucose levels helps people with diabetes to avoid additional health problems such as kidney or eye issues [74, 75]. The kind of medications used here include the following:

- Oral antidiabetic medications: Type 2 diabetes is frequently managed with oral antidiabetic medicines [76]. Metformin, the first-line treatment, is so due to its proven effectiveness in reducing mortality [76]. Metformin reduces glucose production by the liver [78]. There are several classes of pharmaceuticals, mostly administered orally, that can aid in managing hyperglycaemia in individual having type 2 diabetes such as insulin-stimulating production (like sulfonylureas), reduce glucose uptake from the gastrointestinal system (like acarbose), block the metabolic function of the enzyme DPP-4 which inhibits incretins like GLP-1 and GIP (like sitagliptin), improve the body's insulin responsiveness (like thiazolidinediones), and increase glucose excretion from the body (like SGLT2 inhibitors) [78] (Table 2).
- Insulin Therapy: Insulin is an anti-glycaemic agent drug that lowers high sugar levels, especially in people with type 1 diabetes and, to a lesser extent, in people with type 2 diabetes as well as associated consequences [86]. The World Health Organization recognizes insulin as an essential medication that should be widely available and accessible to people globally [6, 87]. Type 1 diabetes results from a deficiency of insulin, and insulin is commonly used to manage this condition [88]. Subcutaneous injections or insulin pumps are the typical methods of administering insulin, but some types can also be given through intravenous or intramuscular injections [86, 88]. The speed at which insulin is processed in the body differs, resulting in various peak times and lengths of effect [88]. Insulins that act more quickly often have extended peak durations and remain in the body for longer periods [89]. In the management of type 2 diabetes, a sustained-release form of insulin is usually introduced initially, while continuing with oral medications [77]. Insulin dosages are then increased until the desired glucose levels are achieved [90].

  It is important to monitor patients regularly and provide comprehensive education on insulin therapy, as improper administration can have serious consequences. For example, if food intake is reduced, the insulin dosage may need to be reduced as well [91]. Physical exercise affects the absorption of glucose by cells in the body, which is regulated by insulin with varying onset times and durations. This means that exercise can reduce the need for insulin [92]. However, insulin therapy also carries risks due to the inability to consistently monitor an individual's blood glucose level and adjust insulin infusion accordingly [93].
- Herbal Medication: For centuries, people have used herbal medicine to treat several illnesses, including diabetes [94]. Diabetes is a chronic condition that results in high blood sugar levels, which can lead to severe complications if not managed effectively. Despite the availability of conventional treatments like oral hypoglycaemic drugs and insulin therapy, numerous individuals with diabetes opt for complementary and alternative therapies, such as herbal medicines [94]. Fenugreek, cinnamon, bitter melon, and *Gymnema sylvestre* are some of the herbs that have been employed in the past to treat diabetes. These herbs are believed to help

Table 2 The antidiabetic drugs that can be taken orally have varying modes of action and potential side effects

Oral agent	Mechanism of action	Side effect	References
Sulfonylurea, e.g. gliclazide, glibenclamide, glipizide, glimepiride	Sulfonylureas act on pancreatic beta cells by binding to and blocking the KATP channels, which are sensitive to ATP and located in the cellular membrane. This action prevents potassium from leaving the cell, leading to depolarization. As a result, voltage-gated channels for Ca^{2+} open, causing an increase in cytosolic Ca^{2+}. This increase in Ca^{2+} levels results in a greater integration of insulin granules with the phospholipid bilayer and consequently, an increase in the production of mature insulin	Hypoglycaemia, weight gain, gastrointestinal upset, headache, and hypersensitivity reactions	[79, 80]
Postprandial glucose regulators, e.g. repaglinidine, nateglinide	Postprandial glucose control medications work by interacting with KATP channels in the cellular membrane of pancreatic beta cells, which are sensitive to ATP. These medications block the postprandial glucose control mechanism by preventing potassium from leaving the cell, leading to depolarization. This depolarization causes the opening of the Ca^{2+} channels which is voltage-gated. This allows an influx of Ca^{2+} ion into the cell increasing the concentration. The increased Ca^{2+} concentration facilitates the interaction of the membrane of the cells and insulin granules, increasing the synthesis of mature insulin. However, the effects of these medications are short-	Hypoglycaemia and weight gain	[81]

(continued)

Table 2 (continued)

Oral agent	Mechanism of action	Side effect	References
	lived with a peak of two to 4 h after administration and a duration of less than 6 h, as they are rapidly absorbed and eliminated from the body		
Biguanide, e.g. metformin	Biguanides work by activating the AMP-activated protein kinase (AMPK). The breakdown and synthesis of fats and carbohydrates, insulin signalling pathways, as well as the maintenance of overall ATP homeostasis heavily depend on this protein. When AMPK is activated, expression of the small heterodimer partner is increased, which leads to the reduction in the synthesis of genes partaking in glucose production in the liver, particularly those responsible for phosphoenolpyruvate carboxykinase as well as glucose-6-phosphatase	Gastrointestinal upset and lactic acidosis	[82, 83]
Thiazolidinedione, e.g. pioglitazone, rosiglitazone	Thiazolidinediones (TZDs) are a class of drugs that work by activating PPARs, which are specific nuclear receptors also known as PPAR-gamma or PPARG. They are categorized as PPARG agonists. Free fatty acids (FFAs) and eicosanoids are the main ligands for these receptors. When the PPAR receptor is activated in combination with the retinoid X receptor (RXR), it can affect gene expression, suppressing some genes and increasing the transcription of others. The transcription of certain genes mainly causes adipose cells to store more fatty	Weight gain and oedema	[84, 85]

(continued)

Table 2 (continued)

Oral agent	Mechanism of action	Side effect	References
	acids, leading to a decreased transported of fatty acids. Consequently, energy is generated through the breakdown of sugars, especially glucose, to produce energy for various biological processes		
Alpha-glucosidase inhibitors, e.g. acarbose	Alpha-glucosidase inhibitors work by hindering the conversion of oligosaccharides into monosaccharides, which is carried out by alpha-glucosidase enzymes in the small intestine. Acarbose, a type of alpha-glucosidase inhibitor, lowers postprandial blood glucose levels by competing with dietary polysaccharides for alpha-glucosidase enzymes, which reduces the absorption of glucose	Gastrointestinal upset	[81]

regulate blood sugar levels by boosting insulin production, reducing sugar cravings, enhancing insulin sensitivity, and slowing down carbohydrate absorption [95]. Various herbal remedies, including *Acacia arabica*, *Allium sativum*, *Aegle marmelos* L., *Zingiber officinale*, *Aloe barbadensis*, and *Eucalyptus globulus*, are naturally insulin-mimetic or insulin secretagogues [93]. Some herbs, such as *Juniperus communis*, *Salix planifolia*, and *Pinus banksiana*, help in the efficient absorption of glucose [95], while others serve as α-amylase inhibitors, such as *Eugenia cumini* seeds (632 ρg/ml) [96], *Aloe barbadensis* (30 ρg/ml) [96], *Morus alba* (1440 ρg/ml) [97], *Pterocarpus marsupium* (0.9 ρg/ml) [98], and *Costus pictus* (2510 ρg/ml) [99], among others.

3.2 Current Research on Chinese and Ayurvedic Medicines

One of the first methods of treating and managing illness dates back to the Chinese and Ayurveda medicine [100]. Chinese and Ayurvedic medicine make up more than 65% of all herbal on the market today [101]. It is crucial to analyse the conclusions the most recent research has produced.

Emblica officinalis's antidiabetic properties were evaluated by [102]. According to their findings, 200 mg/kg b.w. of the fruit extract significantly lessened sugar level in the blood. In their study on *Salacia reticulata*, [103] found that compounds isolated from the plant, such as Salcinol and kotalanol, had the capacity to inhibit -glucosidase. Combinations of *S. reticulata* and *Catharanthus roseus* L. showed reduced level of fat and glucose in rats induced to diabetes. Furthermore, they say that in comparison to controls, herbs lowered level of glucose in the blood of diabetic-induced rats. Inhibition of the enzymes aldose, glucosidase, as well as pancreatic lipase is what mostly lowers blood glucose levels. Research carried out in vitro employing a rat pancreatic cell line RINm5F have revealed that the fractions of *Tinospora cordifolia* stem rich in isoquinoline alkaloids exhibit properties of insulin release and mimicry. Similarly, in vivo experiments have also confirmed these effects. These fractions include palmatine, jatrorrhizine, and magnoflorine [104]. Another isoquinoline alkaloid, called berberine, has been the subject of research and has been proven effective in both experimental and human diabetes. According to reports, berberine can reduce high blood sugar levels just as effectively as metformin [105]. Furthermore, the stem and root of *Tinospora cordifolia* contain neosporin, isocolumbin, palmatine, tinocordiside, cordioside, and sitosterol compounds, which are believed to possess properties such as antidiabetic, anti-hyperlipidemic, and antioxidant properties [103]. *Aegle marmelos* (L.) Corrêa demonstrated a considerable drop in HbA1c, PPBG, and BMI, while *Allium sativum* L. showed a significant decrease in PPBG and DBP; *Aloe vera* L. was found to significantly reduce BMI, and *Anethum graveolens* L. was found to suggestively lower fasting insulin, insulin resistance, LDL, and other parameters, according to [106] systematic review and meta-analysis from 2022. They arrive at the conclusion that Ayurveda botanicals have favourable effects on outcomes connected to type 2 diabetes [107]. conducted a research on people who have been diagnosed of type 2 diabetes, where they evaluated the impact of a hydroalcoholic extract of *Crocus sativus* L. on various factors such as HbA1c, lipid profile, fasting blood glucose, and renal and liver function tests. According to the study findings, the extract was potent in reducing HbA1c, fasting blood glucose, serum cholesterol concentration, and LDL-c levels, by improving insulin sensitivity and enhancing antioxidant enzyme activity. However, there was no noticeable difference observed in the liver and renal function tests. The study conducted by [108] on *Azadirachta indica* leaves and twigs revealed that the aqueous extract had a significant effect in reducing fasting blood sugar, post-prandial glucose level, insulin resistance, as well as HbA1c when compared to a placebo. Moreover, neem was found to be more effective than the placebo in terms of improving endothelial function, reducing oxidative stress, and systemic inflammation. The extract was effective across all doses, but it had no impact on lipid profile or platelet aggregation. As per [109], supplementing with *Anethum graveolens* (dill) powder led to significant reductions in total cholesterol, malondialdehyde, and low-density lipoprotein cholesterol levels in the group treated. The homeostatic typical valuation of insulin resistance and mean serum levels of insulin also showed significant improvement. The intervention group had considerably greater average of serum total antioxidant capacity and high-density lipoprotein compared to baseline assessment. The frequency of digestive complaints related to colonic motility was the only one that significantly decreased with supplementation.

The treated groups had considerably lower mean scores than the control group when malondialdehyde, low-density lipoprotein cholesterol, insulin, and total cholesterol levels were considered. Additionally, the treatment group's mean improvements in high-density lipoprotein were substantially higher in comparison to that of the control group. In an experiment conducted by [110], rats are being nourished diet heavy in fat and receiving streptozotocin (STZ/HFD) treatment, which resulted in distorted insulin resistance (IR) pointers across the three IR valuation methods used in the study. Their insulin and sugar levels were much higher than normal throughout the experiment. The study used EmbliQur, a treatment that comprises *Emblica officinalis* and *Curcuma longa*, and it is verified to be effective in reducing the elevated BGL caused by HFD/STZ and improving IR in all animals subjected to the IR test. According to a study conducted by [111] on the results of using separated compounds and unrefined components from *Striga orobanchioides* Benth on diabetic rats induced by streptozotocin, pentacyclic triterpenoids were found to be present (81.5% w/w) in the ethylacetate-methanolic fraction of the ethanol extract. Betulin was discovered through spectroscopic analysis of the isolated chemical. The bioactive fraction and betulin demonstrated substantial inhibition of digestive enzymes in vitro, and the group receiving betulin at a dose of 40 mg/kg showed substantial improvement in their level of diabetes. Gene expression studies disclosed that betulin at a dosage of 40 mg kg^{-1} improves liver glucose usage, sinks hepatic inflammation, and surges insulin making. In silico tests revealed that the plant compound has a strong ability to impede the enzymes DPP-IV, α-glucosidase, GK, and α-amylase.

According to [112], JQ-R, a Chinese herbal medicine preparation, consists of three active components, namely, the polyhydric alcohols of *L. japonica*, *A. membranaceus* saponin, and the whole alkaloid fraction of *C. chinensis*. These fractions have been verified to possess antidiabetic effects in diabetic KK^{Ay} mice and in vitro. The aforementioned components efficiently control the metabolism of glucose, reduce oxidative stress, and regulate related inflammatory responses. By promoting glucose absorption through the insulin-dependent PI3K-AKT signalling pathway, JQ-R was effective in improving glucose metabolism partially in diabetic KK^{Ay} mice. According to a study by [113], mulberry leaves were found to have potential in treating diabetes through in vivo and in vitro tests. Aqueous extract of the leaves which revealed alkaloids and flavonoids as the main hypoglycaemic components was given to diabetic mice, producing rates of inhibition of $87.29 \pm 1.32\%$ and $86.12 \pm 1.79\%$, respectively, on glucosidase activity. When given to diabetic rats, aqueous mulberry leaf extract improved glucose tolerance by 19.02% and lowered blood sugar levels by 28.17%. The extract also had positive effects on gut flora, reduced kidney damage, and lowered blood levels of insulin, tumour necrosis factor-α (TNF-α), glycosylated serum protein, and free fatty acid. These results imply that the beneficial interactions between the different components of the leaves of mulberry may be responsible for their hypoglycaemic actions. According to [114], the study found that the polyphenols of mulberry leaf, which consist of various compounds such as rutin, benzoic acid, hyperoside, and chlorogenic acid, effectively suppressed glucose transport. The degree of inhibition increased over time and with higher concentrations of MLPs. The blood glucose lowering impact of *Dendrobium officinale* and the related mechanisms were demonstrated in a study by [115]. The study found that *Dendrobium officinale* had an impact on the cAMP-PKA and Akt/FoxO1 signalling pathways conciliated by glucagon. This resulted in the encouraged synthesis of glycogen as well as inhibition of glycogen breakdown and gluconeogenesis in the liver. In a study conducted by [116], it was discovered that polyphenols derived from *Azadirachta indica* have the ability to enhance glucose absorption in muscle tissue and decrease the functioning of the proteins responsible for breaking down polysaccharides. As per [117], *Cordyceps militaris* extract exhibits a blood sugar-lowering effect. In addition, it has the ability to improve and repair damaged pancreatic islet cells, increase the thymus index, reduce pro-inflammatory cytokines release, and limit the release of cytokines. This indicates that the immunomodulatory and inflammatory-reducing qualities of *Cordyceps militaris* are closely associated. The study also showed that quercetin has a curative impact on diabetic retinopathy in rats with the disease. Furthermore, the study found a correlation between the treatment outcome and the level of expression of HO-1. In a study conducted by [118], a diabetic rat was treated with a microcapsule encapsulating quercetin, and the results on enteric nerves were assessed. The outcomes showed that by reducing oxidative stress, this therapy may mitigate the nerve damage brought on by diabetes [119]. conducted a study in 2022 that found ZSP to significantly increase the PI3K/AKT pathway's activity through increasing the expression of Akt1 and Akt2 proteins and the copying of the 4 catalytic PI3K subunit genes pik3ca, pik3cb, pik3cd, and pik3cg. The phosphorylated forms of these proteins were also considered due to their role in PI3K and AKT activation. The outcomes disclosed that ZSP enhanced PI3K/AKT signalling at both translational and transcriptional levels when likened to the model group. However, there was a discrepancy in the normal group's PI3K and AKT mRNA and protein expression, which could be due to possible differences in post-transcriptional regulation between wt/wt and db/db animals. Additionally, the high insulin levels in db/db mice may donate to the elevated PI3K and AKT expression as a result of ongoing insulin stimulation.

3.3 Several Traditional Herbal Medicines' Modes of Action

Plants exhibit antidiabetic properties by reactivating pancreatic cells to increase insulin production, inhibiting glucose absorption in the gastrointestinal tract, or promoting metabolites involved in insulin-dependent activities. The existence of certain compounds, such as polyphenols, flavonoids, terpenoids, and coumarins, in medicinal plants is believed to be responsible for their antidiabetic effects [120]. Different herbal remedies have diverse methods of demonstrating their antidiabetic function. Some of these include the following:

- Ginseng (*Panax* spp.): The greatest study has been done on this medicinal herb's hypoglycaemic effects. Ginseng's geographic origin, amount, dispensation, and diabetes types have the main effects on its potency and effectiveness [121]. *Panax ginseng*, sometimes recognized as Chinese or Korean ginseng, possess the uppermost medicinal potential [121]. Ginseng diminishes blood sugar by regulating several different mechanisms (Fig. 3). *Panax ginseng* at a concentration of 0.1–1.0 g/mL was found to significantly increase the amount of insulin released from pancreatic islets of rats which was isolated when glucose is present at an amount of 3.3 mmol/L [122]. Oral ingestion for 20 days of 100 mg/kg b.w. of heat-processed American ginseng was taken and was found to decrease serum glucose levels, glycosylated proteins, and glycated haemoglobin (HbA1c) in rats with diabetes caused by streptozotocin (STZ). Additionally, the treatment increased values of creatinine clearance and reduced the storage of N (ϵ)-(carboxymethyl) lysine and its receptors in the kidneys [123]. Ginsenosides are one of the numerous constituents that have been isolated from ginseng and are regarded to be the active ingredient. Polysaccharides, peptides, and poly acetylenic alcohols are additional components [124]. The water-soluble extract of ginseng root has the ability to reduce diabetes when compared to its fat-soluble components. The ginsenosides present in both American and Panax ginseng are thought to improve insulin resistance and its sensitivity at the target tissues [121]. There are some foods that don't appear to assist lower blood sugar levels since they have low ginsenoside contents [125].

- Bitter lemon (*Momordica charantia*): Research has indicated that bitter melon exhibits hypoglycaemic effects in cell culture, animal experiments, as well as clinical trials involving humans [126, 127]. The bitter melon's antidiabetic ingredients include alkaloids, vicine, charantin, polypeptide-P, and other

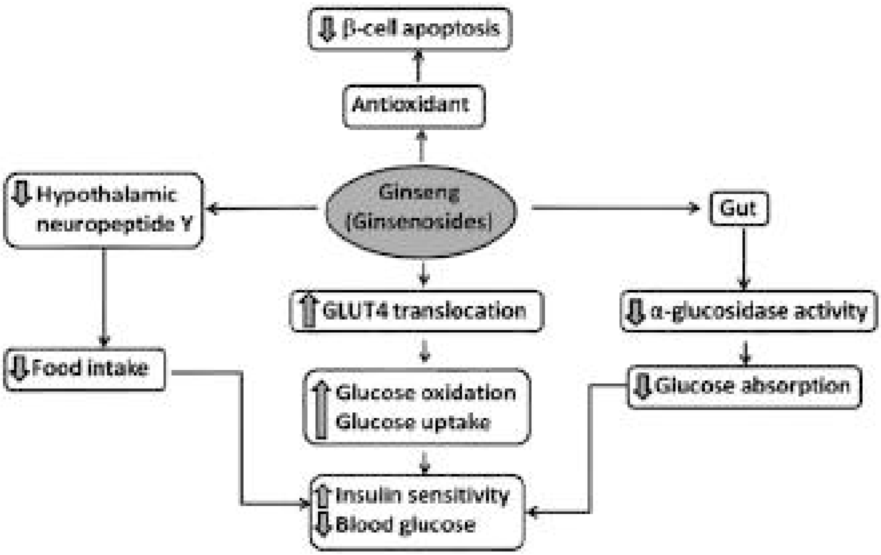

Fig. 3 The mechanism by which ginseng increases glucose metabolism [121]

non-specific bioactive antioxidants [121]. Bitter melon's oleanolate-glycoside was found to enhance glucose tolerance in individuals with type 2 diabetes by inhibiting the absorption of sugar in the intestines [121]. Bitter melon has been verified to reduce levels of glucose in the blood in mice with diabetes caused by STZ by preventing cell peroxidation and apoptosis, increasing the amount of liver and muscle glycogen, and stimulation of the enzymes in the liver such as phosphofructokinase, glucokinase, and hexokinase activity [128]. In diabetic rats caused by STZ, the inactivity of liver fructose-1,6-bisphosphatase and glucose-6-phosphatase activities resulted in decreased gluconeogenesis. However, overexpression of glucose-6-phosphate dehydrogenase (G6PDH) in red blood cells and hepatocytes enhanced glucose oxidation [129]. In summary, research conducted on both humans and animals has demonstrated that bitter melon plays a role in regulating glucose and lipid metabolism (as depicted in Fig. 4). Although the exact mode of action is still being investigated, bitter melon can be utilized as a dietary supplement or herbal medicine for managing diabetes and/or metabolic conditions [130].

- Fenugreek (*Trigonella foenum-graecum*): A type of medicinal product made from a plant's dried seed that is indigenous to North Africa, China, and India [121]. Fenugreek was used in Ayurveda for millennia as both a demulcent (an agent that soothes inflammation of the throat, nose, mouth, or skin) and a laxative [121]. Fenugreek seed powder users apparently experience decreased postprandial glucose levels [132]. This can be due to a slowdown in gastrointestinal glucose absorption and a bulk laxative action. Fenugreek, however, also appears to boost insulin release since it contains 4-isoleucine [131, 133]. Research has demonstrated that fenugreek seeds are effective in improving glycaemic regulator and reducing resistance of insulin in people with type 2 diabetes that is moderate. Furthermore, fenugreek seed supplementation has a positive effect on hypertriglycaeridemia and increases HDL-C levels. Supplementation with

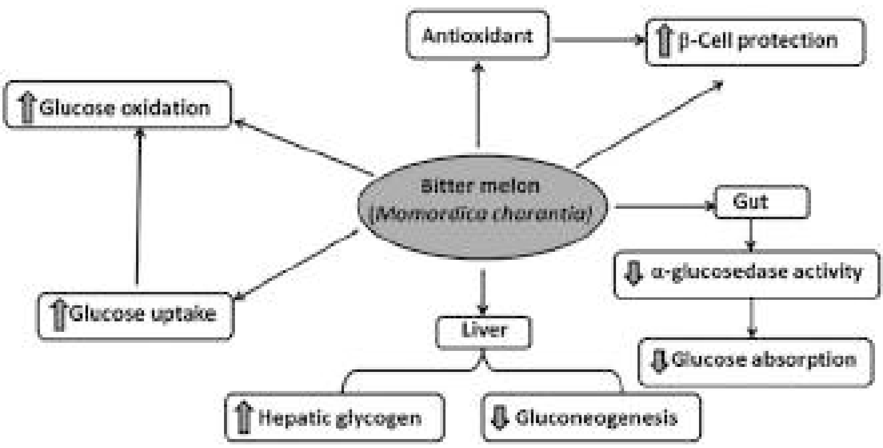

Fig. 4 Bitter melon's mechanism of action in lowering blood sugar [121]

fenugreek leaves improves body weight and liver glycogen levels, and its impact on glucose metabolism is significant, similar to the effects of glibenclamide [134]. Studies conducted on experimental diabetes indicate that fenugreek leaf powder has the ability to reduce oxidative stress. In rats with diabetes, administration of fenugreek has been found to decrease lipid peroxidation and significantly enhance the antioxidant system [135].

- *Coptis chinensis*: In China, *Coptis chinensis* is widely utilized for the management of diabetes. The active component of the *Coptis chinensis* plant is an isoquinoline alkaloid known as berberine. The plant stems, bark, roots, and rhizomes contain it [121]. Giving diabetic rats berberine through intragastric administration at doses of 100 and 200 mg kg^{-1} resulted in a reduction of fasting blood sugar levels, total cholesterol, triglycerides, and low-density lipoprotein cholesterol (LDL-C) in the blood. At the same time, there was an increase in high-density lipoprotein cholesterol (HDL-C), nitric oxide (NO) levels, and prevention of the elevation of glutathione peroxidase (GSH-px) and superoxide dismutase (SOD) [136]. Berberine can bring about a reduction in body weight and an increase in insulin response, which may be due to various mechanisms. In MIN6 cells and rat islets, it decreases glucose-stimulated insulin secretion (GSIS), boosts AMPK activity, and enhances the translocation of GLUT4 in adipocytes and myotubes [137, 138]. In addition, it raises the synthesis of PPAR α/δ/γ/ proteins in the liver and enhances the expression of insulin receptors in the liver and skeletal muscle cells, which stimulates the use of glucose by cells in the presence of insulin [139]. Furthermore, in rats with diabetes induced by STZ, berberine significantly lowers the activity of disaccharidases and α-glucuronidase in the intestine [140]. A berberine derivative called dihydroberberine (dhBBR) displayed advantageous benefits in vivo in animals fed a high-fat diet [141]. Figure 5 provides an overview of the several ways that berberine lowers blood sugar levels.
- Banaba (*Lagerstroemia speciosa*): Banaba belongs to the same family as the banaba plant. Banaba leaf extracts are highly favoured in the Philippines and Southeast Asia, and they are frequently employed by diabetics in North America. Banaba comprises two significant components that have two significant impacts on individuals with diabetes [121]. Corosolic acid and ellagitannins are two components found in banaba extracts that appear to function similarly to insulin and stimulate the activation of insulin receptors [142]. The main reasons for the above-mentioned effect are thought to be either the inhibition of tyrosine phosphatase or the stimulation of tyrosine kinase insulin receptor. Initial clinical investigations indicate that individuals suffering from type 2 diabetes who take a special banaba extract (named glucosol) for 2 weeks experience a notable 10% drop in their the levels of sugar in the blood as opposed to those who receive a placebo [143]. Research has shown that banaba possesses a hypoglycaemic impact; however, additional investigation is required to assess its potential long-term effects [121].
- *Agaricus* mushroom (*Agaricus* spp.): Despite having its roots in Brazil, *Agaricus* is now readily accessible in Japan, China, and other Asian countries. It has carbohydrates like betaglucans, which, like those in other mushrooms, seem to boost immune function markers and serve as an immunostimulant [121]. *Agaricus*

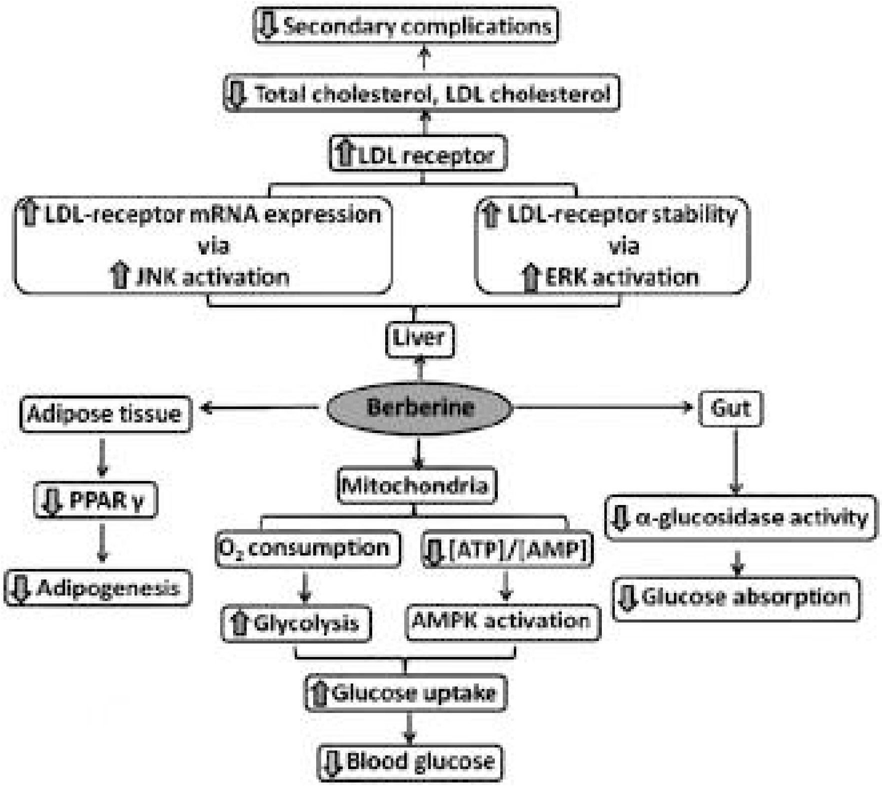

Fig. 5 The mechanism of action of berberine in controlling blood sugar [121]

mushrooms contain certain compounds that can enhance sensitivity of insulin as well as lowering resistance of insulin in individuals with type 2 diabetes. Additionally, these compounds may elevate adiponectin levels, which could potentially decrease insulin resistance [121]. Clinical studies have shown that individuals with type 2 diabetes who augmented their regular treatment with half gram of *Agaricus* mushroom extract thrice daily had decreased overnight levels of insulin in comparison to others who abstained from eating the mushroom [144]. For the majority of people, the *Agaricus* mushroom extract appears to be harmless when used for a period of up to 12 weeks. However, it can cause potentially harmful drops in blood sugar levels (hypoglycaemia) [144].

3.4 Surgery

If type 1 diabetics experience severe complications from their illness, such as end-stage kidney disease that requires a kidney transplant, a pancreas transplant may be considered as an uncommon alternative [145, 146].

Weight loss surgery, which is often used to treat obesity, can also be a successful therapy for obese patients that are diabetic [147]. Following surgery, many patients are competent to maintain normoglycaemia without the need for medication, which can reduce the risk of long-term mortality [148, 149]. However, it is unclear what BMI thresholds should be used to determine if surgery is appropriate [149]. It is recommended that individuals who are unable to control their blood sugar levels and weight should consider this option [150].

3.5 Self-Management and Support

In countries like the United Kingdom that have a general practitioner system, diabetes treatment is typically provided outside of hospitals. Hospital-based care is usually only necessary in cases of complications, difficulty in controlling blood sugar levels, or for research purposes. General practitioners and specialists may work together on occasion to provide care. Additionally, managing diabetes through telehealth from the comfort of one's own home can be a successful strategy [151].

Computer-based self-management interventions are utilized to gather data for educational programmes that aim to aid self-care in type 2 diabetics [152]. Nonetheless, there is insufficient proof to back the effects on various physiological, psychological, and emotional outcomes such as blood pressure, cholesterol, weight, dietary changes, depression, depression-related quality of life, and other related factors [152, 153].

- Glycaemic surveillance and management: Glycaemic monitoring and control refers to the process of measuring and managing blood glucose levels in individuals with diabetes [154]. Blood glucose monitoring using a glucometer is a common method employed for this purpose. If necessary, adjustments are made to insulin dosages, dietary habits, and exercise routines to ensure that blood glucose levels remain within a predetermined target range [155, 156]. Regular monitoring is critical in reducing short-term and long-term issues associated with diabetes, including hypoglycaemia, renal damage, and cardiovascular disease. It is recommended to consult with a healthcare professional to determine the most appropriate target range and monitoring frequency for your individual needs [153]. Additionally, measuring haemoglobin A1c levels every three to 6 months offers an average of blood glucose levels over the past two to 3 months and is vital for effective monitoring [157]. Managing blood glucose levels effectively in addition to monitoring blood glucose also requires a healthy diet, regular exercise, and appropriate medication use, including insulin and oral hypoglycaemic agents [158]. Individuals with diabetes should work with a healthcare professional to develop a personalized plan for monitoring and regulating their blood glucose levels.
- Diabetes education: Diabetes education pertains to educating people on the essential expertise as well as ability to treat their disease, which involves understanding the causes; recognizing warning signs, symptoms, and possible

complications; as well as learning preventative and treatment strategies [159]. This education encompasses several topics, such as comprehending the effects of diabetes on the body, monitoring blood glucose levels, making necessary insulin adjustments, creating healthy meal plans, engaging in physical activity and exercise, understanding medication usage, identifying and avoiding potential complications, managing emotional well-being and stress, and many more [159]. Diabetes education can be offered in various settings, including hospitals, clinics, community centres, and online [159]. Self-management lessons, workshops, or one-on-one counselling sessions may be included, and it can be provided either in a group or individual context [87, 160]. Proper diabetes education and receiving appropriate care can lead to improved overall quality of life, decreased chances of complications, and more fulfilling lives for individuals with diabetes. By collaborating with healthcare professionals to design a customized education programme and attending diabetes education sessions on a regular basis, individuals with diabetes can stay informed about new developments in science and treatment methods [159].

4 Prevention of Diabetes

Type 1 diabetes has no known mitigating measures [161]. However, healthy lifestyle choices, such as diet and exercise modifications, can often prevent type 2 diabetes from developing or postpone it [162], and it constitutes approximately 85–90% of all global instances [163].

4.1 Lifestyle

Numerous healthy lifestyle practices have been established to assist in the prevention of diabetes. It is believed that smoking cigarettes significantly increases the risk of developing diabetes [164]. Stopping smoking is a critical preventive measure as it increases the chances of developing diabetes and its associated consequences [165]. According to a 2015 study, there is a clear link between the amount of exposure to cigarette smoke along with the chance of developing type 2 diabetes, with the risk increasing as the amount of exposure to cigarette smoke increases [164]. The 2014 Surgeon General's Report highlights the position of promoting smoking termination as a crucial public health strategy to combat the global diabetes epidemic, stating that people who smoke frequently have 30–40% higher likelihood of developing type 2 diabetes than individuals who do not [166].

4.2 Alcohol

In 2010, approximately 41% of adults worldwide consumed alcohol based on available data [167]. The WHO reported that on average, individuals above

15 years of age consume 6.2 L of unadulterated alcohol per year, corresponding to 13.5 g [168]. A 2015 report indicated that 86.4% of individuals 18 years or older in the United States reported consuming alcohol [169]. The consumption of alcohol has the potential to increase the likelihood of developing diabetes. Furthermore, extreme alcohol ingestion portends various chronic health conditions, including diabetes mellitus and its associated problems [169]. Multiple studies have revealed different associations between alcohol ingestion and diabetes risk, including positive, null, U-shaped, or J-shaped relationships [170]. While liquor ingestion may have various effects on blood sugar levels, studies have found that prolonged and regular drinking can cause upsurge insulin resistance [171]. To prevent the negative effects of alcohol on insulin resistance and blood sugar, it is recommended to minimize alcohol intake to a maximum of two drinks per day. Additionally, it is advised to consume alcohol with food or a snack, rather than on an empty stomach [172]. Average alcohol consumption is linked to a minimized chance of developing type 2 diabetes mellitus (T2DM) compared to those who drink minimally or not at all, while consuming excessive amounts of alcohol carries the same danger as not drinking [169]. Assessment of cohort research as a whole conducted in various countries has provided convincing evidence that consuming fewer than 30 g of alcohol in a day is linked with reduced risk of developing T2DM in the populace [173]. Another study suggests that the highest risk reduction for developing T2DM is 18% for individuals who consume between 10 and 14 g of alcohol per day [174]. Research has indicated that alcohol consumption may prevent diabetes from occurring in men and women by delaying its onset [175, 176]. According to research, the consumption of approximately 24 g and 22 g of alcohol per day for women and men, respectively, is linked to the highest level of protection against developing diabetes. However, doses exceeding 50 g for women and 60 g for men daily are deemed harmful [177]. The frequency of alcohol use can also affect the level of risk [174]. Binge drinking, which involves consuming large amounts of alcohol in one go, has been linked with amplified risk of heart disease and other negative health consequences when compared to individuals who consume the same amount of alcohol but with a more frequent consumption pattern spread out across three to 4 days per week [174, 177].

According to a study that followed participants over time, drinking alcohol may advance the chances of getting type 2 diabetes mellitus [178]. Appraisal of multiple studies found that women who drink a lot of alcohol daily are more susceptible to type 2 diabetes development, but this correlation isn't seen as strongly in men [177]. Another study shows that excessive alcohol intake can prevent the body from controlling glucose levels, putting both men and women at higher risk of developing type 2 diabetes [179]. A summary of numerous studies that looked at participants over time found no considerable contrast in the likelihood of getting type 2 diabetes mellitus between those who drink heavily and those who consume less than 48 g of alcohol per day [180]. However, consuming large amounts of alcohol can worsen issues with managing blood glucose levels, which can promote the likelihood of having type 2 diabetes and its related complications [178]. There is evidence that drinking alcohol can lower insulin resistance [181]. Alcohol intake can affect how the body processes glucose, whether someone has diabetes or not. Drinking alcohol on an empty stomach can surge the risk of hypoglycaemia by reducing the making of glucose and breakdown of stored glucose, especially when combined with certain medications and low glycogen levels [182]. Explanations for how alcohol can add to the progression of diabetes includes decreased activity in beta cells, increased insulin resistance, and a reduction in glucose tolerance. Studies have found a connection between higher blood glucose levels and decreased beta cell activity, as well as increased alcohol consumption [183]. Frequent and excessive alcohol intake can make it harder for the body to maintain healthy blood glucose levels, which can cause problems with glucose tolerance and increase insulin resistance [184]. Alcohol consumption can lead to weight increase, an important trigger for type 2 diabetes, according to data [184, 185].

4.3 Diet and Exercise Modification

Combining a healthy diet with regular exercise can reduce your chances of developing diabetes, help you lose weight, lower your cholesterol levels, and reduce your blood pressure [160]. The American Diabetes Association (ADA) endorses maintaining a healthy weight, engaging in at least two and a half hours of physical activity per week (even just taking long walks can be enough), consuming foods with moderate amounts of fat (about 80% of caloric intake should come from healthy fats), and getting enough fibre from sources like whole grains [186]. Getting more exercise can help lower type 2 diabetes risk, particularly after eating a high-carbohydrate meal that causes a spike in blood sugar levels [187, 188].

Increase your intake of whole grains, fibre, and the polyunsaturated fats in fish, nuts, and vegetable oils [172, 188]. Red meat and other foods high in saturated fat should be avoided so as to lessen the likelihood of diabetes development [189].

5 Conclusion

Diabetes has long been treated and prevented with herbal therapy. Herbs work in a variety of ways, including by boosting glucose absorption, lowering oxidative stress, and improving insulin sensitivity. It is encouraging that herbal medicine can be used to treat and prevent diabetes. However, despite these functions, there need to be more research on identifying bioactive constituents of plants and elucidating their mechanism of action.

Abstract

Plants serve as a revered base for the natural products that support human health. There is growing evidence that Ayurvedic medicinal herbs and the secondary metabolites they produce can be used to treat cancer. Numerous research have documented the value of herbal plants in immune system modulation, cancer

patient survival, and quality of life. For the treatment and prevention of cancer, Ayurvedic herbal remedies are included into mainstream therapy. Humans are becoming more and more reliant on herbal remedies because they are safer and more potent than manufactured pharmaceuticals. The value of medicinal plants is rising due to its potential and uses. The use of Ayurvedic medicinal herbs for the prevention and treatment of various malignancies is examined in this chapter's review work. This chapter also discusses a report on the potential use of phytoconstituents in the treatment of cancer.

1 Introduction

Herbalism is a term that literally refers to the use of plants to treat a variety of human illnesses. The word "herb" derives from a Latin word that designates a plant's vegetative and reproductive parts that are used for therapeutic purposes. The use of medicinal plants as a source of drugs to treat or prevent various diseases may be dated back about five millennia in recorded accounts from India's early civilisations. The natural products that enhance human health are derived from plants. The Plantae might contain a range of therapeutically useful physiologically active compounds, as well as unique templates for synthesising analogues and stimulating tools for better understanding biological processes [1–8].

According to the WHO in 2011, approximately 88% of the world's population relies on herbal medications that have therapeutic efficacy. Long before the prehistoric era, plants were employed for medical purposes. Chinese, Egyptian, and Unani authors of old or ancient writings all agreed that items derived from medicinal plants are utilised as areas of medicine. Over a thousand years ago, Vaids and Hakim from various civilisations used medicinal herbs for therapeutic purposes [9–20].

1.1 Traditional Medicine System

Traditional systems of drugs still are being widely practised in various ways. The use of synthetic drugs and its negative impact and high cost leads to faith of human beings on medicinal plants. Utilisation of plant materials in the form of herbal medicines progressed because of improper supply of medicines and increase in population. The diversified and verdant plant kingdom is renowned for their therapeutic value [21–32]. More utilisation of plants for medicinal purposes enhanced because of development of varied herbal therapies. According to the Turkish Journal, significant value of medicinal plants or herbal plants increased importance over allopathic medicines because of presence of many narcotic compounds. Medicinal plants bestowed with varied compounds having biotic origin and showing medicinal and therapeutic values. Medicinal plants are exceptionally a magnificent possibility for curing human diseases because of presence of analgesic, anti-inflammatory, anti-tumour, and antiviral properties. Medicinal plants have various better properties over chemical medicines because plant-derived compounds are more tolerant, non-toxic, and beneficial for the human body [33–48].

India is the birth place and vast repository of various plants having medicinal value. Among many ancient and primitive civilisations, Indian civilisation has been evidenced for medicines assessed from herbs. Flora of India provides path for processing of herbal drugs. Nearly eight thousand herbal medicines are documented in India by AYUSH. Various types of medications are accepted by Indian culture which was assessed by Unani, Siddha, and Ayurvedic systems [49–62].

80% of the world's population, according to the WHO (2012), relies on herbal medicines for health reasons. Around 21,000 plant species with therapeutic properties that are used globally for basic health were also documented by the WHO (2012). More than 30% of a plant species' total biomass was employed for therapeutic reasons. The contribution from quickly developing nations like China and India is at most 80%. India and China contributed more towards the herbal medication. Rural population of these countries mainly rely on indigenous medication system. Treatment is associated with natural system having maximum positive impact and minimal negative impact. Remedies based on nature are good for human beings and medicinal plants play very vital role in herbal treatment. Medicinal plants are restrained as ironic possessions of components which can be utilised for drug formation. Therapeutic value of plants mainly depends on medicinal properties of plants [63–85].

The biologically active chemicals found in the plant kingdom constitute a largely untapped source of potential medicines as well as useful tools and special templates for studying biological processes. In India, the use of plant composites for therapeutic purposes has grown over time [80–82, 84–88]. Traditional medicines have played a significant part in addressing the world's healthcare requirements in the past, are still doing so today, and will continue to do so in the future. The Ayurvedic structure in India has described an enormous number of those medicines buttressed plants or plant material and therefore the determination of their morphological and pharmacological or pharmacognostical characters. It can offer a better considerate of their active principles and mode of accomplishment. Young people nowadays are completely dependent on allopathy, therefore using medicinal plant mixtures to halt the disease's sneaky effects is an alternative to Western medications, which often have terrible side effects. Secondary metabolites found in medicinal plants, such as flavonoids, flavones, anthocyanins, lignans, and coumarins, have been shown to have anticancer activities. Items are made from herbs, especially in Ayurveda. The use of traditional remedies in India was emphasised in the ancient Vedas and other writings [89–101]. Ayurveda has two primary goals: first, to promote health and second, to treat disease. Ayus and Veda, two Sanskrit terms that translate to "life" and "knowledge," respectively, are the origin of Ayurveda. Literally, it signifies understanding of and research into life. Ayurveda, the science of life, may be a part of India's illustrious Vedic legacy. Ayurveda, the oldest system of medicine in India, uses plant extracts to combat cancer-causing chemicals and eradicate tumours associated with cancer. Three major expositions on Ayurveda – the Charaka Samhita (a work on ancient Indian medicine), the Sushruta Samhita (a text on ancient Indian surgery), and the Kashyapa Samhita – are well known (text on gynaecology and child health). Ayurveda which prescribes a variety of medications for preserving health, vitality, youthfulness, and longevity. Ayurveda considers health as a equilibrium of delight or happiness of the soul, sense, and mind. Medicines prepared by Ayurvedic mechanisms well proved for cancer treatment having anti-cancerous properties [102–114]. Ayurvedic medicines have an ability to fight against the cancerous tumours. Preparations of medicines by Ayurvedic method act as an ancillary or a concomitant treatment alongside radiotherapy or chemotherapy. Negative impact of chemotherapy and radiotherapy can be reducing by usage of Ayurvedic medicines. Ayurvedic medicines assist to detain the cancerous cells where radiotherapy and chemotherapy have significant side effects. The ancient therapeutic art and science of Ayurveda focuses on enhancing, sustaining, and balancing mind-body health. It also takes a holistic approach to health and wellness. Meditation is the cornerstone of Ayurvedic medicine's approach to mind-body healing. Ayurvedic medicines that are sold in many parts of the world have undergone substantial research about their anti-cancer properties. Both Charaka and Sushruta Samhita referred to granthi and arbuda as the equivalents of cancer (malignant or major neoplasm). Based on the doshas involved, both are frequently inflammatory or non-inflammatory. The Ayurveda definition of health is the harmonious with coordination of vata, pitta, and kapha system within the body [115–131].

1.2 Cancer and Its Molecular Basis

Cancer is characterised by uncontrolled and unrestrained cell proliferation. It appears as a growth in a clinical context. A malformed mass of tissue known as neoplasm grows erratically and keeps growing long after the factors that first triggered its growth have been removed. A tumour is described as benign if its characteristics are believed to be essentially harmless, which implies that it wouldn't spread to neighbouring or distant regions, could be surgically removed without difficulty, and didn't constitute a severe threat to the patient's life [132–141]. Malignant tumours are collectively referred to as cancers, which are derived from the Latin word for crab, because they have a crab-like effect on the tissues. A malignant tumour has the ability to spread to distant areas (metastasize), harm nearby structures, and ultimately lead to death. Not all cancers result in death; with early detection and appropriate care, certain cancers can be cured [142–178].

Cells that proliferate expand quickly.

- Nucleotide sequence changes due to genetic mutation
- Agents that cause cancer, or carcinogens

Such genetically modified crops, rising cigarette use, fast food, alteration, or mutation may be inherited through the germ line or acquired through the action of environmental forces. Environmental agents Rapid development, neighborhood invasion, and the ability to metastasize far away are characteristics of malignant neoplasms. The ability of a cancer cell to proliferate in the absence of growth signals, resistance to signals that would normally stop a cell from dying, ability to form new blood vessels, ability to spread to other tissues, ability to metastasize to distant organs, and failure to repair damaged DNA are just a few of the key changes that occur in a cancer cell [179–202].

1.3 Common Cancers

Men are most likely to have lung, prostate, colorectal, stomach, and liver cancers worldwide. The most often diagnosed cancers in women are those of the breast, cervix, colorectum, lung, and stomach [203–217]. Oral, lung, stomach, and colorectal cancers are becoming prevalent among men in India. The most prevalent cancers in women are breast, cervix, colorectal, ovarian, and oral cancers [213, 216, 218–230]. According to the geographic region, prevalent social customs, and socioeconomic strata, different malignancies have different incidence rates. For instance, oral malignancies are more common in the Indian subcontinent than in Western nations. This is a result of increased use of chewable tobacco products including gutkha, paan, paan masala, khaini, and supari, among others. Due to inadequate genital cleanliness, cervical cancer is more prevalent in women from lower socioeconomic groups. Those who consume more fatty foods and fewer fibre in their diets are more likely to develop colorectal cancer [231–242].

1.4 Common Causes of Cancer

There are many agents who causes cancer or increases the risk of cancer. Some major agents are as follows (Fig. 1). Also some risk factors of cancer are shown in Table 1.

Fig. 1 Common causes of cancer [100]

Table 1 Some common conditions and risk factors of certain cancer

Tobacco	The single most significant preventable risk factor for cancer death worldwide is tobacco use. It is thought to be responsible for 22% of cancer deaths annually, according to the WHO. The vast majority of lung cancers are linked to smoking. Those who don't smoke have also been linked to malignancies by passive smoking. Danger rises as smoking frequency increases. The usage of smokeless tobacco is more common in the Indian subcontinent. They include using raw tobacco, betel quid, gutkha, pan masala, masheri, and other substances
Alcohol	Drinking alcohol increases your risk of acquiring a number of cancers that are related to alcohol. It has a synergistic impact when taken with smoking that significantly raises the risk of cancer development compared to when either chemical is consumed alone
Obesity	People with BMIs over 30 are considered obese. They are more likely to get cancer, diabetes, and heart disease. Regular exercise and a healthy, balanced diet are crucial for battling the obesity pandemic
Areca nut	It is also referred to as supari in India. It is called as Pan or betel quid and can be chewed either alone or in combination with betel leaf, catechu, and slaked lime. It is linked to a condition called submucous fibrosis, which gradually narrows the chewer's mouth aperture and is a sign of malignancy
Pollution	This refers to the environmental pollution of the air, water, and soil caused by the usage of carcinogenic substances. Both ingestion and air exposure to these compounds, which are known as carcinogens, have the potential to cause cancer

(continued)

Table 1 (continued)

Occupational exposure	Numerous compounds, such as asbestos, cadmium, ethylene oxide, benzopyrene, silica, ionising radiation, including radon, tanning booths, aluminium and coal manufacturing, and the manufacture of iron and steel, are known to cause various cancers. Understanding these is essential because the majority of these cancers are preventable with the correct knowledge and safety precautions
Radiation	Exposure to ionising radiation has been associated with a greater risk of acquiring a number of cancers. UV radiation has been related to skin cancers such basal cell carcinoma, squamous cell carcinoma, and melanoma
Biological agents	A wide range of germs, parasites, and viruses that raise people's chance of developing cancer. Oropharyngeal and cervical cancers have been linked to the human papilloma virus (HPV). Hepatitis B and C are associated with liver cancer. Schistosomiasis, a parasite infection, is associated with an increased risk of bladder cancer. *H. pylori* infection may result in stomach cancer
Lifestyle factors	High body mass index is associated with cancers of the oesophagus, colorectum, breast, endometrium, etc. Consuming red meat increases your chances of colon and rectal cancer. A nutritious diet that includes fruits, salads, and vegetables has been found to reduce the risk
Unprotected sex	Unprotected sex also causes cancer in males or females

2 Importance of Traditional Plant-Based Drugs in Treatment of Cancer

Plant-based drugs are becoming more and more common all around the world. Recent studies on herbal plants or medicine have made substantial progress in the pharmacological study of several plants used in traditional medical systems. The secondary metabolites or compounds found in therapeutic plants include tannins, terpenoids, alkaloids, and flavonoids. These compounds determine the therapeutic effectiveness of the plants, especially their antimicrobial activity. The use of plant-derived remedies as an indigenous treatment in traditional systems of medicine has been related to the advent of plant-derived medications in contemporary medicine. It has been discovered that several of the plants have potent anticancer properties. Cancer is treated with medicines made from plants [211, 212, 243–248]. The traditional herbal plants used to treat cancer are listed in the table below.

2.1 List of Traditional Plants Used to Treat Cancer

There are so many plants that possess anticancer properties. Some of these plants and their chemical constituents are shown in Table 2.

Table 2 Plants with anticancer potentials

Sr. No.	Botanical name	Family	Chemical constituents	Types of cancer
1.	*Ferula assafoetida*	Apiaceae	Coumarin compounds	Liver cancer [9]
2.	*Thymus vulgaris*	Lamiaceae	Thymol	Prostate cancer [10], head cancer [11]
3.	*Thymbra spicata*	Lamiaceae	Thymol	Lung cancer [12]
4.	*Taverniera spartea*	Fabaceae	Isoflavonoid compounds	Breast and prostate cancer [13]
5.	*Peganum harmala*	Nitrariaceae	Alkaloids	Breast cancer [14], cervical cancer [13, 22]
6.	*Viola tricolor*	Violaceae	Flavonoids	Cervical cancer [23]
7.	*Achillea wilhelmsii*	Asteraceae	Phenolic compounds	Colon cancer [24]
8.	*Mentha pulegium*	Lamiaceae	Piperitone	Blood cell cancer [25]
9.	*Ammi visnaga*	Apiaceae	Visnadine	Breast cancer [26]
10.	*Camellia sinensis*	Theaceae	Epicatechin	Breast cancer [27]
11.	*Avicennia marina*	Acanthaceae	Flavonoids	Breast and larynx cancer [15, 16]
12.	*Silybum marianum*	Asteraceae	Flavonoids	Colorectal cancer [17], breast cancer [18]
13.	*Artemisia absinthium*	Asteraceae	Artemisinin, isorhamnetin	Colon cancer [19], blood cancer [20]
14.	*Curcuma longa*	Zingiberaceae	Curcumin	Breast [21], prostate [28], cervix [3], larynx cancer [29]
15.	*Crocus sativus*	Iridaceae	Phenolic compounds	Sarcoma, oral cancer [30, 31]
16.	*Zingiber officinale*	Zingiberaceae	Flavonoids	Urinary cancer [32], prostate cancer [33]
17.	*Olea europaea*	Oleaceae	Oleic acid	Breast cancer [34], colon cancer[35]
18.	*Taxus baccata*	Taxaceae	Taxol	Prostate cancer [36], pancreatic cancer [37], blood cell cancer [38]
19.	*Nigella sativa*	Ranunculaceae	Thymoquinone	Prostate [39]
20.	*Allium sativum*	Amaryllidaceae	Allicin	Cervical cancer [40], breast [41, 42] colon [43, 44], larynx [45]
21.	*Lepidium sativum*	Brassicaceae	Vitamins (A, B, C, and E)	Breast cancer [46]

(continued)

Table 2 (continued)

Sr. No.	Botanical name	Family	Chemical constituents	Types of cancer
22.	*Trigonella foenum-graecum*	Fabaceae	Alkaloids	Breast cancer [47, 48]
23.	*Glycyrrhiza glabra*	Fabaceae	Glycyrrhizin	Kidney cancer [48]
24.	*Physalis alkekengi*	Solanaceae	Physalins	Cervical cancer [50, 51]
25.	*Lagenaria siceraria* Standl	Cucurbitaceae	Vitamins B and C	Lung cancer [52], breast cancer [53]
26.	*Ferula gummosa*	Apiaceae	Sesquiterpenes	Lung cancer [54], skin cancer, stomach cancer [55]
27.	*Urtica dioica* L.	Urticaceae	Phenolic compounds	Prostate cancer [56–58]
28.	*Ammi majus*	Apiaceae	Coumarin compounds	Breast cancer [59]
29.	*Rosa damascene*	Rosaceae	Phenolic compounds	Lung cancer [60], breast cancer, cervix [61]
30.	*Astragalus cystosus*	Fabaceae	Lectins, flavonoids	Lung cancer [62]
31.	*Myrtus communis*	Myrtaceae	Myrtucommulone	Breast cancer [63–65]
32.	*Vinca rosea*	Apocynaceae	Vindoline	Breast cancer, larynx cancer [64]
33.	*Citrullus colocynthis*	Cucurbitaceae	Quercetin	Liver cancer [66]
34.	*Polygonum aviculare*	Polygonaceae	Flavonoids and alkaloids	Breast cancer [67], cervical cancer [68, 69]
35.	*Astrodaucus orientalis*	Apiaceae	A-thujene and a-copaene	Breast cancer [70]
36.	*Actinidia chinensis*	Actinidiaceae	Polysaccharide	Hepatic cancer [71]
37.	*Aegle marmelos*	Rutaceae	Lupeol	Breast cancer and leukaemia
38.	*Agave americana*	Agavaceae	Steroidal and alkaloid	Cancerous tumour
39.	*Aloe vera*	Asphodelaceae	Emodin	Leukaemia, stomach cancer [72]
40.	*Alpinia galanga*	Zingiberaceae	Pinocembrin	Leukaemia
41.	*Amoora rohituka*	Meliaceae	Amooranin	Lymphocytic [73]
42.	*Andrographis paniculata*	Acanthaceae	Flavonoids	Colon cancer [74]

(continued)

Table 2 (continued)

Sr. No.	Botanical name	Family	Chemical constituents	Types of cancer
43.	*Annona muricata*	Annonaceae	Acetogenins	Lung cancer and liver cancer [75]
44.	*Apis mellifera*	Apidae	Protein	Lymphoid cancer [76]
45.	*Ananas comosus*	Bromeliaceae	Bromelain	Leukaemia [77], gastrointestinal carcinoma [78]
46.	*Angelica sinensis*	Apiaceae	Polysaccharide	Cervical cancer [79], brain tumour [80], glioblastoma multiforme [81]
47.	*Annona species*	Annonaceae	Acetogenins	Nasopharyngeal cancer [82]
48.	*Arctium lappa*	Asteraceae	Arctigenin [85]	Prostate cancer [83, 84]
49.	*Artemisia asiatica*	Asteraceae	Iso-liquiritigenin	Liver tumour
50.	*Astragalus membranaceus*	Fabaceae	Swainsonine	Gastrointestinal cancers and liver cancer [85]
51.	*Azadirachta indica*	Meliaceae	Limonoids and nimbolide	Leukaemia [78]
52.	*Bauhinia variegata*	Caesalpiniaceae	Cyanidin glucoside	Breast cancer [79]
53.	*Berberis vulgaris*	Berberidaceae	Berbamine and berberine	Prostate cancer, oral cancer [80]
54.	*Betula alba*	Betulaceae	Betulinic acid	Prostate cancer [82], thyroid [86], breast cancer [84], colon cancer [85]
55.	*Betula utilis*	Betulaceae	Ursolic acid and betulin	Liver cancer, breast cancer [78]
56.	*Bolbostemma paniculatum*	Cucurbitaceae	Tubeimoside-5	Glioblastoma cancer [79]
57.	*Cannabis sativa*	Cannabaceae	Cannabinoids	Breast cancer, colorectal cancer [80, 81]
58.	*Catharanthus roseus*	Apocynaceae	Vincristine and vinblastine	Non-Hodgkin's lymphoma and Hodgkin's disease
59.	*Cinnamomum cassia*	Lauraceae	Coumarin	Promyelocytic leukaemia and basal cell carcinoma [84]
60.	*Colchicum luteum*	Liliaceae	Colchicines	Hodgkin lymphoma

(continued)

Table 2 (continued)

Sr. No.	Botanical name	Family	Chemical constituents	Types of cancer
61.	*Combretum caffrum*	Combretaceae	Combretastatin	Colon cancer and lung cancer [85]
62.	*Coriandrum sativum*	Apiaceae	Quercetin	Adenocarcinoma [87, 88]
63.	*Daphne mezereum*	Thymelaeaceae	Mezerein	Lung cancer and lymphocytic leukaemia [89]
64.	*Echinacea angustifolia*	Asteraceae	Arabinogalactan	Oesophagus cancer [90]
65.	*Emblica officinalis*	Phyllanthaceae	Emblicanin a and b	Liver cancer
66.	*Fagopyrum esculentum*	Polygonaceae	Inhibitor-1 protein,	Lymphoblastic leukaemia [91]
67.	*Ginkgo biloba*	Ginkgoaceae	Ginkgolides	Invasive oestrogen-receptor breast cancer
68.	*Glycine max*	Fabaceae	Genistein and daidzein	Cancer in oral
69.	*Gossypium hirsutum*	Malvaceae	Gossypol	Breast cancer and melanoma [92]
70.	*Indigofera tinctoria*	Fabaceae	Tannins and phenols	Lung cancer [84]
71.	*Lentinus edodes*	Polyporaceae	Terpenoids and lentinan	Colon cancer and lung carcinoma [93]
72.	*Linum usitatissimum*	Linaceae	Lignans	Breast cancer [80, 94]
73.	*Nothapodytes foetida*	Icacinaceae	Scopoletin, camptothecin	Colon cancer [85, 95]
74.	*Ochrosia elliptica*	Apocynaceae	9-methoxy ellipticine	Breast, kidney cancer [85, 96]
75.	*Ocimum sanctum*	Lamiaceae	Ursolic acid	Fibrosarcoma
76.	*Oldenlandia diffusa*	Rubiaceae	Stigmasterol	Stomach cancer [88, 97]
77.	*Origanum vulgare*	Lamiaceae	Rosmarinic acid	Lung cancer [85]
78.	*Panax ginseng*	Araliaceae	Polyacetylene	Stomach cancer [85]
79.	*Pfaffia paniculata*	Amaranthaceae	Cytotoxic substances	Oestrogen positive breast cancer [88]
80.	*Picrorhiza kurroa*	Plantaginaceae	Picrosides-i, ii, iii	Liver cancer [90]
81.	*Plumbago zeylanica*	Plumbaginaceae	Plumbagin	Fibrosarcoma cancers [90]
82.	*Podophyllum hexandrum*	Berberidaceae	Podophyllotoxin	Leukaemia [87]

(continued)

Table 2 (continued)

Sr. No.	Botanical name	Family	Chemical constituents	Types of cancer
83.	*Prunella vulgaris*	Lamiaceae	Oleanolic acid	Oral cavity [88]
84.	*Psoralea corylifolia*	Fabaceae	Psoralidincorylfolinin	Osteosarcoma [88]
85.	*Viscum album*	Santalaceae	Phenolic compounds	Testis cancer [89]

3 Conclusion

Cancer is the unchecked growth of malignant cells or tissues within the body. A cancerous growth is referred to as a malignant tumour or malignancy. A growth that is not cancerous is referred to as a benign tumour. Each of the sequential, connected processes that restrict the rate of cancer spread is sequential and interconnected. The traditional medical systems that are currently in use each have their own linked concepts and historical settings. While some of them, like Ayurveda traditional medicines, are spreading over the globe, some of these, like Tibetan traditional medicine, are still mostly exclusive to the country of origin. Many compounds found in plants have been demonstrated in clinical studies to have chemoprotective effects. Inhibiting angiogenesis is a novel approach to cancer treatment. The proper selection and application of this plant could very well aid in the management of cancer through antiangiogenic therapy. Plant-derived anticancer medicines are in high demand because they effectively inhibit cancer cell lines. In order to meet demand and be sustainable, the exploitation of these agents needs to be controlled. The attempt has been made to compile a list of the many different plant species found throughout the world that are either regularly utilised or being researched for their potential anticancer properties.

Contents

Abstract

Diseases affecting the digestive tract's activities are referred to as GIT disorders. Stomach or abdominal pain, dyspepsia, bloating, diarrhea, constipation, dysentery, vomiting, and gastroenteritis are typical gastrointestinal illnesses. Patients with gastrointestinal issues are routinely treated with herbal or alternative treatments. In several regions of the world, herbs have historically been trusted for the management of numerous illnesses. They are considered vital bases of pharmaceutical items, especially herbal remedies, and their use considerably impacts the delivery of basic health care. Because they have minimal side effects when used

appropriately, herbal medications are becoming more and more popular with Westerners. In recent years, a widespread trend has been there toward a resurgence of interest in a conventional system of medical care. According to the WHO, traditional medicine has a place in the primary healthcare system. Medicinal plants remain to be a significant source of treatment in developing nations. The majority of people in developing nations, or about 88% of them, are thought to rely on a traditional system of medicine for their medical care. When treating GI problems, evidence-based, rational phytotherapy which employs herbs and herbal preparations to provide the desired therapeutic effect plays a significant role. Given the variety of these disorders, it stands to reason that a wide range of herbal products can be utilized in both prevention and treatment. This chapter aims to review the use of various herbs and herbal preparations for managing and preventing gastrointestinal diseases as well as their safety and efficacy.

1 Introduction

The gastrointestinal tract (GIT), also known as the human digestive system, is made up of a hollow, twisting muscular tube that starts from the oral cavity, where food is taken in the mouth and travels through the throat, esophagus, stomach, and intestines before ending at the rectum and anus, from where digested food is discharged. Solid organs of the digestive system cover the gallbladder, pancreas, and liver. GI tract bacteria, also called gut flora or microbiome, aid digestion. Bacteria are the most prevalent and diverse group of microbial eukaryotes (fungi, protozoa, archaea, and viruses) that make up the human gastrointestinal microbiota. Its bacterial ecosystem is extensive and complex, with up to 1014 bacteria present – more than ten times as numerous as somatic human cells [1]. The GI tract's primary functions include digestion, absorption, excretion, and protection. Such tasks are carried out by a few specialized organs extending from the mouth to the anus. The stomach and small intestine are majorly responsible for digestion and absorption due to physical mechanisms like retropulsion along with chemical factors such as the presence of bile and enzymes in the small intestine. Desiccating and compacting waste, which is then kept in the rectum and sigmoid colon until it is evacuated, are the main jobs of the large intestine [2]. Ailments affecting the digestive tract's activities, like absorption of food and liquid, digestion, or excretion, are referred to as gastrointestinal disorders [3]. These conditions are brought on by infections with different bacterial, viral, and parasite species [4, 5].

1.1 Types of Gastrointestinal Disorders

There are two types: functional and structural.

Functional gastrointestinal disorders (FGIDs) are ailments where the digestive system appears normal but does not operate as it should. Functional disorders can affect anyone at any age, including adults, teens, and children. Yet, rather than being the outcome of an illness or infection, FGIDs cause sensitivity and a variety of GI symptoms due to improper functioning. The three main traits of FGIDs are dysfunction in the brain-gut axis, sensation, and motility.

Motility is the term for the muscular activity of the GI tract. The sensation is produced by the GI tract's nerves in response to stimuli (e.g., digestion of food). Functional GI illnesses may have nerves that are so responsive that even normal contractions can be painful or uncomfortable. A failure in communication between the brain and the GIT is known as a brain-gut dysfunction. FGIDs may impair the regulatory pathway between brain and gut function. Some of the indications of FGIDs are nausea, stomach pain, constipation, bloating, burping, flatulence, diarrhea, vomiting, and indigestion [6].

Structural gastrointestinal disorder refers to conditions where the colon seems aberrant and is not functioning properly. Sometimes the structural anomaly must be surgically removed. GI structural illnesses include inflammatory bowel disease, colon cancer, stenosis, colon polyps, hemorrhoids, and diverticular disease. Untreated structural GI problems usually aggravate symptoms and lead to life-threatening consequences [6].

1.2 General Signs of Digestive Disorders

Clearly, the conditions and symptoms of digestive illnesses are unique and vary from individual to individual. Nonetheless, most digestive problems exhibit certain indications and symptoms. Figure 1 illustrates typical indications [7].

The few commonest gastrointestinal conditions are:

1. Celiac Disease
2. Irritable Bowel Syndrome (IBS)
3. Lactose Intolerance

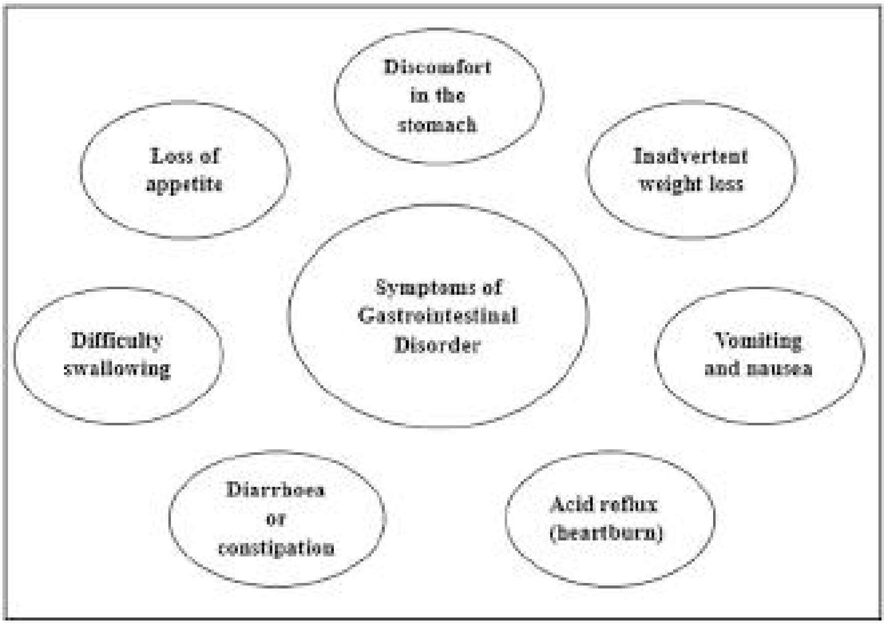

Fig. 1 Common symptoms of gastrointestinal disorders

4. Chronic Diarrhea
5. Constipation
6. Gastroesophageal Reflux Disease (GERD)
7. Peptic Ulcer Disease
8. Crohn's Disease
9. Ulcerative Colitis
10. Gallstones
11. Chronic and Acute Pancreatitis
12. Liver Disease
13. Diverticulitis [7]

1.3 Synthetic Medicines for Gastrointestinal Disorders and Their Adverse Effects

Gastrointestinal disorders are typically treated with the following class of medications.

- **Antacids**

  An antacid is a blend of many components having various salts of calcium, magnesium, and aluminum as their active substances. The antacid functions by neutralizing the acid present in the stomach by inhibiting the action of the proteolytic enzyme pepsin. The elderly and newborn populations are particularly vulnerable to negative consequences. It is not advised to take antacids frequently in this group for reasons of safety. Table 1 lists the therapeutic applications and negative effects of antacids [8].
- **Histamine H2-receptor antagonists (Histamine Blockers)**

  For a range of gastrointestinal disorders, including those listed in Table 1, stomach acid-suppressing drugs also called H2 receptor blockers or H2 receptor antagonists (H2RAs) are routinely prescribed. H2RAs prevent the endogenous ligand histamine from binding and showing its action by reversibly attaching themselves to receptors available on stomach parietal cells, hence reducing stomach acid output. Antagonists of the H2 receptor are often well tolerated. Headache, weariness, drowsiness, fatigue, abdominal pain, constipation, or diarrhea are examples of mild side effects. There is a correlation between the usage of H2RAs and some side effects, as shown in Table 1, in individuals who are over 65 or have hepatic or renal impairment [9].
- **Proton pump inhibitors**

  Proton pump inhibitors (PPIs) prevent the final step of gastric acid secretion by blocking the hydrogen/potassium adenosine triphosphatase (H+/K+ ATPase) enzyme, also known as the "proton pump," in the parietal cells of the stomach. The following conditions associated with stomach acid secretion are advised for the prevention and treatment of PPIs. In general, doctors do not worry about PPIs having serious side effects when used over a brief amount of time say 2 weeks,

Table 1 Reported adverse effects of synthetic medications

S.No.	Category of medications	Therapeutic use	Adverse effects	References
1	Antacids	Heartburn symptoms of GERD Gastric and duodenal ulcers Gastritis due to stress Non-ulcer dyspepsia Bile acid caused diarrhea Biliary reflux Constipation	Constipation Hypophosphatemia Hypercalcemia Osteopenia Microcytic anemia Fecal impaction Nausea Vomit Stomach cramps	[8]
2	Histamine H2-receptor antagonists (Histamine Blockers)	GERD Ulcer of duodenum or GIT, hypersecretion of gastric juices, and indigestion and heartburn	Delirium, confusion, hallucinations, or slurred speech	[9]
3	Proton pump inhibitors	Gastro-esophageal ulcers, peptic ulcer disease, non-steroidal anti-inflammatory drug-associated ulcers, Zollinger-Ellison syndrome, and eradication of *Helicobacter pylori*	Dementia, fracture risk, hepatocellular carcinoma, nosocomial pneumonia, chronic kidney disease, nutritional deficiencies, vitamin B12, iron and calcium deficiency, bacterial overgrowth, gastric polyps	[10]
4	Prokinetics	Functional dyspepsia	Parkinson-like symptoms, Dystonia, Akathisia, Galactorrhoea, and breast engorgement	[11]

but reports of adverse effects arise with the growing use of these drugs on long-term use. According to current studies, PPIs can be consumed only for a shorter duration of time in the lowest possible dose which is effective enough because using them for a longer time may pose adverse effects like reduced nutritional absorption, dementia, infections, kidney disease, and hypergastrinemia. The therapeutic uses and side effects of chronic PPI usage are listed in Table 1 [10].

- **Prokinetics**

  Dopamine antagonists (metoclopramide, domperidone, levosulpiride, and itopride) and serotonin (5-HT) receptor agonists for example cisapride and mosapride make up the majority of the prokinetic medications used in clinical settings. Although the effectiveness of all prokinetic medications for the treatment of gastrointestinal hypomotility disorders is well recognized, these medications are also linked to a number of negative side effects, which are mentioned in Table 1 [11].

2 Herbal Therapy for the Management and Prevention of Gastrointestinal Diseases

Herbal therapy has significantly improved human health because of its capacity to promote health, heal illnesses, and treat and rehab patients. Herbal medicine, also known as phytomedicine, or phytotherapy, comprises herbs, herbal components, or formulations, which have plant-based active chemicals or other compounds [12]. Numerous studies indicate that traditional people around the world frequently employ plant-based therapies or herbal medications to address problems in the digestive system. People can treat several digestive-related illnesses simply by regularly incorporating herbal substances into their diet for improving the performance of the digestive system. These herbal treatments function in a variety of ways, either by easing the bowel movements, enhancing the digestive process, raising the bowel movement frequency, detoxifying the body, eliminating toxins, minimizing gas, settling an upset stomach, and decreasing the bloating and digestive discomfort. All societies have employed medicinal plants throughout history as a type of medicine for the treatment of various human maladies, and they still have a crucial role in our current technology-based civilization. Approximately half of all medications currently used in clinical settings are plant-derived components or natural drug products or their derivatives [13]. For their health care, almost 80% of individuals in underdeveloped nations mostly use traditional herbal remedies that contain plant extracts or their active ingredients [14]. Secondary metabolites, also known as phytochemicals, are abundant in medicinal plants, and their derivatives display a wide range of biological characteristics, including anti-plasmodial, anti-inflammatory, anticancer, and antioxidant effects [13, 15, 16].

This review's objective is to provide some illustrations of studies that have been successful in establishing the efficacy of various gastrointestinal illnesses treated with plants.

2.1 Herbs Used in Gastrointestinal Diseases

2.1.1 *Aloe barbadensis* Miller

Aloe barbadensis Miller is one of more than 400 species of aloe that are native to arid tropical and subtropical weathers, including the southern United States, also referred to as *Aloe vera* (Fig. 2a). They are all members of the Liliaceae family and originated in South Africa [17]. Only a few aloe species have recently been thought to be important commercially, with *A. vera* being of utmost strength and thus the maximum well-liked herb in the research community [18].

Secondary metabolites produced by *A. vera* are recognized to be beneficial [17, 19]. The two most important secondary metabolites are anthraquinones and tricyclic aromatic quinines, both of which are widely distributed. Chrysophanol and Aloe-emodin are the two main anthraquinone derivatives that are found in nature [20]. It has been suggested that the type III polyketide biosynthesis pathway is used

Fig. 2 (**a**) Leaves of *Aloe barbadensis Miller* (**b**) Dried ripe fruits of *Anethum graveolens L* (**c**) Dried ripe fruits of Carum carvi L. (**d**) Fruits of Emblica officinalis (**e**) Dried ripe fruits of *Foeniculum vulgare* Mill. (**f**) Dried roots of Glycyrrhiza glabra (**g**) Leaves of Mentha piperita (**h**) Seeds of Plantago ovata Forsk (**i**) Fruits of Trachyspermum ammi L. (**j**) Seeds of Trigonella foenum-graecum L (**k**) Rhizome of Zingiber officinale

to generate the tricyclic aromatic quinines found in aloe [21]. The important secondary metabolites in *A. vera* gel are aloesin, aloin, and aloe-emodin (an oxidative derivative of aloin) [22].

For the treatment of stomach infections due to *H. pylori*, *aloe vera* gel acts as a special and effective natural remedy. It exhibits antibacterial action against both susceptible and resistant *H. pylori* strains. The cytoprotective properties of *Aloe vera* leaf extracts are explored for their benefits in digestion and peptic ulcer treatment [23]. *Aloe vera* latex is frequently used to treat constipation because it contains anthraquinone glycosides, which are known to have laxative effects [24, 25]. In a double-blind, randomized controlled trial (RCT) with 28 healthy individuals, it is discovered that aloin had a greater laxative effect than the stimulant laxative phenolphthalein [26]. The *L. brevis* strains were isolated from naturally fermented *A. vera* gel and called POAL (probiotics from aloe leaf) strains because they displayed exclusionary resistance to a variety of antibiotics while preventing the growth of various dangerous enteropathogens in the gut [27]. The colonic flora converts the aloin included in the gel into reactive aloe-emodin, which has a purgative effect. Aloe-emodin, a compound derived from *A. vera*, via decreasing MMP-2/9 reduces the migration of colon cancer cells and suppresses vascular endothelial growth factor (VEGF) and Ras homolog gene family member B through lowering the nuclear translocation and binding of DNA to NF-KB, assuring the effectiveness of aloe-emodin tumor via multiple target sites [28].

2.1.2 *Anethum graveolens* Linn

Dill, *Anethum graveolens* L. (Apiaceae family), is a well-known herb that is frequently used as a spice and also produces essential oil (Fig. 2b). It has been utilized in Ayurveda treatment since ancient times. It is a flavorful annual herb. In Ayurvedic medicine, dill is well known in the treatment of gastrointestinal pain, colic, and to aid with digestion. In Unani medicine, it is utilized for colic, digestive issues, and even for diarrhea [29].

Anethum is a component found in gripe water and used for the treatment of colic pain in infants and flatulence in young children [30]. The seed is stomachic, somewhat diuretic, stimulant, and galactagogue with a pleasant aroma [31, 32]. Dill oil from grapes contains the monoterpenes carvone and limonene as their primary ingredients [33]. Three different compounds phellandrene, dill ether, and myristicin combine to give the dill herb its distinctive aroma [34, 35]. The essential oil from the seeds decreases intestinal cramps and spasms, thereby calming colic [36, 37]. The volatile oil acts as an appetite booster and relieves gas aiding in digestion. Chewing the seeds helps to reduce bad breath [38]. The mucosa is strongly protected by *A. graveolens* L. seed extracts, that possess antisecretory, anti-ulcer, and anti-HCl and ethanol-induced stomach ulcers in mice [39]. The seeds of *A. graveolens* L. were used to extract two flavonoids, quercetin and isorhamnetin, which have antioxidant qualities and may be utilized to fight free radicals. This outcome might help avoid peptic ulcers [40, 41]. The HCl extract of dill fruit strongly relaxed the contractions caused by a range of spasmogens in rat ileum, supporting its importance in traditional medicine for digestive problems [42].

In another study, the effects of methanolic extract of dill on both spontaneous contractions and even those induced by acetylcholine were explored. Cumulative dosages of dill methanolic extract significantly reduced ($p < 0.01$) the spontaneous rat ileum contractions. The extract also reduced the contraction induced by acetylcholine in a dose-dependent manner ($p < 001$). The findings confirmed that the methanolic dill extract had a relaxing effect on the isolated rat gut. Dill extract prevented both naturally occurring and acetylcholine-induced ileum contractions [43].

2.1.3 *Carum carvi* Linn

C. carvi also known as Caraway is an essential medicinal plant belonging to the Apiaceae family (Fig. 2c). It has been grown for a very long time in Egypt, Australia, China, and Iran, as well as in the north and center of Europe [44]. It has been used traditionally as a spice in food and drinks as well as an herbal alternative for the treatment of GI diseases such as dyspepsia, diarrhea, various spasmodic symptoms, bloating, and flatulent colic [45].

Two important natural chemicals are limonene and carvone, having mucoprotective and antiulcerogenic actions on gastroduodenitis and duodenal peptic ulcers [46]. Caffeic acids, quercetin, kaempferol [47, 48], fatty acids (10–18%) (linoleic and oleic acids, petroselinic), essential oil (3–7%), protein (20%), and carbohydrates (15%) are the main constituents of caraway fruits [49]. As per European Pharmacopoeia, caraway fruit possesses essential oil up to 3%, the primary component is D-carvone which is up to 50–65%, (+)-limonene (45%), and carveol and dihydrocarveol (<1.5%). The odor is due to its main constituent D-carvone [50, 51].

An alcoholic extract of caraway has been found to have antispasmodic properties that block the spasmogens acetylcholine and histamine-induced smooth muscle spasms [52, 53]. Caraway oil demonstrated significant levels of selectivity in a study on 12 intestinal bacteria, suppressing the growth of possible pathogens to levels that did not affect the study's beneficial bacteria. This outcome was related to the efficacy and value of caraway oil in traditional medicine for the management of dysbiosis, which is associated with a variety of gastrointestinal and systemic disorders [54]. Caraway extracts reduced acid and leukotriene production, increased mucin secretion, and released prostaglandin E2 preventing indomethacin-induced stomach ulcers in a dose-dependent manner. Histological testing also supported the antiulcerogenic action, which was linked to the flavonoid content and free radical scavenging abilities of the food [55]. In one clinical trial, patients with functional dyspepsia (FD), according to Rome III criteria who were on a placebo with their regular medications, such as PPIs, anticonvulsants, antihistamines, antidepressants / TCAs, beta-blockers, pain modulators, H2RAs, and antacids, were compared with those who were taking enteric-coated capsules encapsulating caraway oil and menthol. The results of the study showed that the symptomatic reduction in the intervention group was quantitatively greater than that in the placebo group. Clinical Global Impressions were improved by intervention and placebo treatments in 61% and 49% of patients, respectively ($p = 0.23$). The treated group experienced no significant side effects [56]. The effectiveness of hot or cold olive oil poultices in curing IBS for 3 weeks, followed by 2-week "wash-out" periods, was compared to the efficiency of hot poultices created with caraway poultices in a cross-over RCT. Two-thirds of patients who used a caraway oil poultice on their skin rated the treatment as satisfactory or very good. The overall IBS-QOL (Quality of Life) score showed a statistically significant difference between caraway oil and the other oils. Comparatively, Caraway oil reported adequate alleviation at 51.8%, compared to hot olive oil 23.5% and cold olive oil 25.8% [57].

2.1.4 Emblica Officinalis

Emblica officinalis holds a revered place in Ayurveda, an ancient medical system practiced in India (Fig. 2d). It is a member of the Euphorbiaceae family. The Indian gooseberry or *Phyllanthus emblica* is another name [58, 59]. The juice of this fruit contains Vitamin C, i.e. 4.78 mg mL^{-1} [60, 61] in larger quantities. Several different acids that are present include gallic acid, ellagic acid, chebulinic acid, chebulagic acid, 1-O-galloyl-beta-D-glucose, quercetin, 3,6-di-O-galloyl-D-glucose, 1, 6-di-O-galloyl beta-D glucose, corilagin, 3-ethylgallic acid (3-ethoxy-4 [62]. Kaempferol-3-O-alpha-L-(6″- ethyl)-rhamnopyranoside and kaempferol-3-O-alpha-L-(6″-methyl)-rhamnopyranoside are flavonoids found in *P. emblica* [63].

P. emblica can improve meal digestion, absorption, and assimilation when used regularly. People that use it discover they prefer the taste of food more. Additionally, it enhances iron absorption for healthy blood. Stomach acids are balanced. For reducing mild to severe hyperacidity, *P. emblica* is the best choice. It is administered medicinally to alleviate diarrhea. In cases of dysentery, it is provided by the locals as a fruit decoction blended with sour milk. Fenugreek seeds infused with leaves are used to treat chronic diarrhea [64].

Polyphenols from *P. emblica* L. are widely used for gastrointestinal organ protection. Since *Helicobacter pylori* are responsible for stomach ulcers, the bioactive substances of amla act as one of the potent inhibitors of these strains in-vitro [65].

The *Phyllanthus emblica* extract was investigated for antiulcer and anti-secretory activities using several models to prompt GI ulcers in mice such as pylorus ligation, administration of indomethacin or necrotizing agent (25% sodium chloride, 0.2 M sodium hydroxide, and 80% ethanol), and hypothermia induction are all used to cause gastrointestinal ulcers [66]. In all the test models employed, oral treatment of extract at doses of 250 mg/kg and 500 mg/kg significantly reduced the development of stomach lesions. In a different experiment, mice with pancreatitis caused by L-arginine had their blood levels of lipase and IL-10 reduced when *P. emblica* L. (rich in tannins and gallic acid) in 200 mg/100 g was administered [67]. The research also showed that the group of rats in *P. emblica* had greater amounts of nucleic acids, pancreatic protein, DNA synthesis rate, and pancreatic amylase. The histological changes in the colon of mice with colitis brought on by acetic acid were also lessened by the methanol fruit extract of *P. emblica* [68]. The daily intake of 500 mg/tablet of *P. emblica* extract daily twice decreased the frequency and intensity of vomiting and indigestion when compared with the placebo group [69].

2.1.5 *Foeniculum vulgare* Mill.

A biennial plant from the Apiaceae family, *Foeniculum vulgare* Mill. (Fig. 2e) has both aroma and therapeutic properties. Due to its flavor, it is a medicinal herb that humans have been aware of and used since ancient times. It was grown in practically every nation [70]. Due to the valuable nutritional makeup of fennel, which includes the presence of important fatty acids, a diet containing the right amount of fennel may have potential health benefits [71].

Fennel water also possesses qualities just like anise and dill water. And when combined with syrup and sodium bicarbonate, this collection forms the domestic "gripe water," that is given to treat newborn flatulence. By adding boiling water to a teaspoonful of smashed fennel seeds, fennel tea can be made which is also used as a carminative [72]. From *F. vulgare*, flavonoids such quercetin-3-rutinoside, rosmarinic acid, and eriodictyol-7-rutinoside have been extracted [73]. The most prevalent flavonoids in *F. vulgare* include quercetin-3-glucuronide, isoquercitrin, kaempferol-3-glucuronide, quercetin-3-arabinoside, isorhamnetin glucoside, and kaempferol-3-arabinoside [74]. There have also been reports of aqueous extract of *F. vulgare* found to include quercetin-3-O-galactoside, kaempferol-3-O-rutinoside, quercetin-3-O-galactoside, and kaempferol-3-O-glucoside [75]. While the methanolic extract was used to isolate quercetin 3-O-rutinoside, quercetin 3-O-glucoside, and kaempferol 3-O-rutinoside, the ethyl acetate extract also yielded quercetin, kaempferol, and isorhamnetin 3-O-rhamnoside. These flavonoids have outstanding anti-inflammatory and antinociceptive properties [76]. Additionally, it was claimed that the antioxidants quercetin, rutin, and isoquercitrin had immunomodulatory properties [77]. Chlorogenic acids and rosmarinic acid (6.8% and 14.9% respectively) are the main phenolic components obtained in the methanolic extract of fennel seeds, while the main flavonoids are quercetin and apigenin (17.1% and 12.5%, respectively) [78].

Fennel essential oil reduces intestinal gas while also controlling the intestine's smooth muscle movement. *Foeniculum vulgare* is approved for the treatment of several symptoms of dyspepsias such as gastrointestinal atony, a feeling of heaviness in the stomach, and many others. It can be taken alone or in conjunction with other herbal remedies for the treatment of these conditions. Fennel can be added to treatments that contain anthraquinone ingredients to lessen the frequency of stomach pain that is frequently related to this kind of laxative [79]. The significant anti-ulcerogenic effect was shown by an aqueous extract of *F. vulgare* on a rat stomach on which lesions were brought on by ethanol. It was discovered that pre-treating with an aqueous extract considerably lessened the harm caused by ethanol to the stomach. When compared to the control group of animals, the effect of the aqueous extract was greatest and statistically significant ($P < 0.001$) in the 300 mg kg^{-1} group of mice. Aqueous extract of *F. vulgare* also markedly decreased levels of malondialdehyde in whole blood while markedly raising levels of Vitamin C, nitrite, Vitamin A, nitrate, and beta-carotene. As a result, rats' stomach mucosal lesions caused by ethanol were prevented by using aqueous fruit extract of *F. vulgare* [80].

2.1.6 *Glycyrrhiza glabra* Linn.

Commonly known as **Licorice**, it belongs to the Leguminosae family and has the scientific name *Glycyrrhiza glabra* (Fig. 2f). Both in parts of Europe and Asia, this therapeutic herb can be found [81].

The triterpenoid saponin glycyrrhizin is the primary constituent of licorice root, also referred to as glycyrrhizinic acid or glycyrrhizic acid, and is typically present in between 6% and 10%. The aglycone molecule (glycyrrhetinic acid) is produced by the hydrolysis of glycyrrhizin due to intestinal flora and a sugar moiety, causing both to be absorbed [82].

By removing the glycyrrhizin molecule, deglycyrrhizinated licorice (DGL) a processed licorice extract is produced that is used to treat peptic and aphthous ulcers. Flavonoids are those parts of DGL that are active. In animal trials, these compounds showed remarkable resistance to the development of chemical-induced ulcers [83]. A few more components of licorice include isoflavonoids (like, licoricone, isoflavonol, glabrol, and kumatakenin), coumarins like herniarin and umbelliferone, chalcones, triterpenoids, lignins, amino acids, amines, sterols, gums, and volatile oils [84].

Even though, glycyrrhetinic acid was the first medication to be shown to speed up the healing process in duodenal and gastric ulcers [85], many doctors who used to use licorice to treat peptic ulcers have started using DGL. As it has been proven to be superior and efficient to glycyrrhetinic acid with no side effects [86]. Over the years, numerous clinical investigations have revealed DGL to be a potent drug for ulcers. It has proven to be incredibly successful to treat stomach ulcers [87–91]. In one trial, DGL (760 mg, thrice a day) or a placebo was given to 33 individuals with stomach ulcers for 1 month. The DGL group (78%) experienced a considerably larger decrease in ulcer size than the placebo group (34%) [89].

DGL was found to be superior to cimetidine (Tagamet), ranitidine (Zantac), and antacids in multiple head-to-head comparison studies, both for the short-term treatment of peptic ulcers and for maintenance therapy [87, 88, 91]. For example, a hundred volunteers were given DGL (760 mg, between the meals, TID) or Tagamet in a head-to-head comparison with 200 mg of Tagamet thrice a day, with a bedtime dose of 400 mg [88]. Despite the fact that Tagamet has several serious adverse effects, using DGL is very safe. Since it was demonstrated in human tests to minimize the gastrointestinal bleeding brought on by aspirin, DGL is strongly advised in patients needing treatment for longer duration with ulcerogenic medications including aspirin, NSAIDs, and corticosteroids, to prevent gastric ulcers [90]. Duodenal ulcers can benefit from DGL as well. DGL was used to treat 40 patients who had more than six relapses the year prior and had chronic duodenal ulcers that had been present for four to 12 years. For 8 weeks, a daily dose of 4.5 g of DGL was given to half of the patients, while the other half had 3 g daily for the same period. Typically, within 5 to 7 days, all 40 patients had significant improvement, and no one needed surgery at the time of the one-year follow-up [92].

2.1.7 *Mentha piperita* Linn.

The earliest medicinal herb utilized in both Eastern and Western traditional medical systems is *Mentha piperita* (Fig. 2g) belonging to the family Lamiaceae. Herbalists have employed *M. piperita* as an emmenagogue, antiseptic, antispasmodic, astringent, carminative, antipruritic, antiemetic, diaphoretic, antibacterial, rubefacient, anticatarrhal, and analgesic [93]. It has historical usage as a spasmolytic for a variety of digestive issues, including colic in newborns, flatulence, diarrhea, dyspepsia, nausea, and vomiting, as well as to lessen gas and cramps [94]. In addition to menthol, peppermint oil also contains limonene, menthone, isomethone, cineole, isopulegol, pulegone, menthofuran, caron, and menthyl acetate [95]. Menthol is the main component of peppermint oil. According to the British Herbal Compendium [96], the leaves of piperita were used to cure biliary problems, indigestion, and intestinal colic. Its usage as a cholagogue and carminative in conditions affecting the gastrointestinal system, gallbladder, and bile ducts was advised by the German Commission, European Scientific Cooperative on Phytotherapy (ESCOP).

The major component of Dabur's "Pudina Hara," an Ayurvedic medicine that is used for the treatment of several stomach-related issues like gas, indigestion, acidity, etc., is *M. Piperita* oil. Mostly the oil is employed for treating the conditions like IBS, liver issues, ulcerative colitis, biliary tract ailments, and gallbladder problems. The gastric emptying rate is increased following *M. piperita* oil administration in a blinded, controlled research in patients with dyspepsia and normal gastrointestinal function [97]. It has a statistically significant impact on gynecological surgery patients who experience nausea [98]. Research indicates that *M. piperita* causes intestinal smooth muscle relaxation by lowering the calcium flux to the jejunum and large intestine [99]. Menthol and similar terpenes exhibit choleretic effects in in-vivo investigations and are useful in the treatment of a patient with bile duct and gallbladder cholesterol stones [100]. Although, piperita is acknowledged to be safe and is approved by Food and Drug Administration (FDA), still people with GI reflexes must use it cautiously because it might cause gallbladder discomfort and bile duct blockage [94].

2.1.8 *Plantago ovata* Forsk

The psyllium plant, *Plantago ovate* (Fig. 2h) of the family Plantaginaceae, is currently grown all over the world, including India [101]. It is originally from Persia. Several members of the *Plantago* genus are collectively referred to as "psyllium," and their seeds are a fantastic source of both soluble and insoluble fiber and are used commercially to manufacture mucilage [102]. The term "mucilage"refers to a class of transparent, colorless gelling substances that are produced by the seed coat and are frequently referred to as the husk or psyllium husky. For ailments such as hypercholesterolemia, colitis, diabetes, colon cancer, and inflammatory bowel disease, *P. ovate* is being utilized in many cultures as a home remedy [103]. Mucilaginous polysaccharide, mostly constitutes rhamnose, xylose, galactose, galacturonic acid, and arabinose, is the main component of the seeds and husk. Fatty acids are also present in the seeds, namely linoleic, oleic, and linolenic acids in concentrations of about 40.6%, 39.1%, and 6.9% respectively making up the majority. Dietary fiber of *P. ovata* may be extracted and has medical benefits, making it a useful source for making low-calorie foods [102].

Chronic constipation, digestion, hemorrhoids, moderate diarrhea, relief of duodenal ulcer, colon cleaning, IBS, demulcent, GERD, and other disorders are regularly treated with psyllium husk as a therapeutic agent [104]. Being an herbal, non-irritating laxative, which helps promote digestion, psyllium husk has been suggested. It transforms into a gelatinous, viscous substance that absorbs water to carry out a specific function when submerged in water. Fibers of husk are usually used to treat constipation and are frequently taken as a supplement. Clinical studies have consistently indicated the raised moisture level in stool, causing it to become heavier and softer while facilitating bowel movements [105]. On the other side, water uptake by psyllium has been demonstrated to impede colon transit and gastric emptying, which is advantageous for people who have diarrhea or stools that are incompatible with liquid stools. Both the number of bowel motions and the strain on the gastrointestinal walls are increased. Hemorrhoids and diverticulitis can be treated with psyllium husk [106]. Because of the accompanying health benefits, the FDA has authorized using psyllium husk in eatable items [107].

According to numerous research, using psyllium husk for medicinal purposes is risk-free and has few negative effects [103]. However, to validate its pharmacological qualities and postulate mechanisms of action for improvements to human health, further research is essentially required.

2.1.9 *Trachyspermum ammi* Linn.

Trachyspermum ammi L. (Fig. 2i), a drug of the Apiaceae family, is a highly prized seed spice with significant therapeutic value [108]. Ajwain fruits consist of brownish essential oil of 2–4%, of which thymol makes up the majority (35%–60%) [109].

Carvacrol, dipentene, α and β-pinenes, α-terpinene, and γ-terpenine as well as para-cymene are all components of the nonthymol fraction thymene [110]. The plant also contains trace quantities of myrcene, caphene, and α-3-carene. Alcoholic extracts possess a saponin that is extremely hygroscopic. A steroid-like compound and a yellow, crystalline flavone have been extracted from the fruits, along with a glucoside, 6-O-β-glucopyranosyloxythymol [111], and 25% of oleoresin that contains volatile oil [112]. One of the main ingredients of *T. ammi* oil is carvone which is 46% [113].

The fruits of *T. ammi* have been used medicinally for amoebiasis, expectorant, stomachic, carminative, and antiseptic purposes. The investigation of calcium channel blockage, which is revealed to facilitate the spasmolytic activities of herbs, supports the conventional usage of Ajwain in gastrointestinal ailments, like colic and diarrhea, as well as in hypertension [114]. Various ulcer models were used to demonstrate the antiulcer activity of *Trachyspermum ammi* fruit. The ulcer index and the proportion of ulcer prevention in mice pre-treated with ethanolic extract considerably lowered in all models. According to the findings, the extract significantly reduced ulcerative lesions, indicating protection ($p < 0.001$) in comparison to the animals in the control group [115]. When *T. ammi* was added in infusion, the gastric acid amount rose because it would cause the secretion of gastric acid to increase. *T. ammi* enhanced gastric acid output by about four times [114].

T. ammi decreased meal transit time in in-vivo experiments with rats, hence boosting the production of bile acids, and/or increasing digestive enzymes activity [116]. One of the studies found that the essence made from the seeds of *T. ammi* considerably decreased ($P < 0.05$) the contractions caused by the neurotransmitter acetylcholine (10^{-4} M). Upon adding the essence of *T. ammi* (0.01%) to the organ bath, it quickly began to have an inhibitory impact on acetylcholine-induced contraction; it reached its peak within 0.5 min and remained for at least 5 min. On the other hand, the same doses of *T. ammi* demonstrated a substantial antispasmodic activity [$P < 0.05$] with cumulative doses of 10^{-5}–10^{-2} M acetylcholine. The highest and lowest inhibitory effect on contraction of about 96.16% and 88.17% were elicited by concentrations of 0.01% and 0.002% *T. ammi*, respectively, in presence of 10^{-3} M acetylcholine with the statistically significant [$P < 0.05$] variations in the anti-spasmodic activity of both the concentrations [117].

2.1.10 *Trigonella foenum-graecum* Linn.

Trigonella foenum-graecum L. (Fabaceae) is also known as fenugreek (Fig. 2j). It has been a valuable spice for generations [118, 119]. One of the many chemical components of fenugreek is steroid sapogenins. It has been established that the fenugreek embryo, which is oily, contains diosgenin. In the stem alkaloids such as Nicotinic acid, trigocoumarin, trigonelline, and trimethyl coumarin are present. Seeds contain mucilage that stands out in specific [29]. The stem contains volatile oil, mucilage up to 28%, fixed oil of about 5% with a great aroma and a bitter taste, alkaloids namely choline and trigonelline, 22% proteins, and a substance that gives the stem its yellow color [120]. Fenugreek has about 58% carbohydrates, 23–26% protein, 6% fat, and 25% dietary fiber [121].

Fenugreek seeds have been found to lessen the GI adverse effects of tablets of metformin in people having diabetes type 2. Fenugreek seeds enhanced and controlled the intestinal microbiota, increased mucus secretion, and selectively stimulated intestinal bacteria. Fenugreek seeds work by decreasing the GI adverse effects of metformin tablets and increasing acceptance of them. This allows for sustained use of the pills as a treatment [122]. Fenugreek seed extract, oil, and powder have been found to hasten the healing of mucosal wounds in mice. In their research, mucilage-containing fenugreek seeds reduced intestinal and stomach swelling by creating a thin, supple covering on the fortifications of the affected organs [123, 124].

Similar to ranitidine, fenugreek seeds are used to treat gastroesophageal reflux [125]. It lessens bloating as well. The number of bacteria was reported to increase by polysaccharides isolated from fenugreek seeds, just like or even superior to inulin in behavior [126]. Fenugreek seeds have antiulcer properties. Seeds of fenugreek have a comparable effect as a popular proton pump inhibitor omeprazole, used to treat digestive problems such as gastroesophageal reflux disease, gastric and duodenal ulcers, and gastritis [127]. The hydro-extract and a fraction of gel extracted from seeds of fenugreek demonstrated notable ulcer-protective properties in a rat model of alcohol-provoked stomach ulcers, which are due to its actions on mucosal glycoproteins and anti-secretory activity. Additionally, fenugreek seed extract prevents alcohol-caused peroxidation of lipids and following mucosa damage likely through increasing the antioxidant capability of the stomach mucosa [127]. An aqueous trigonella seed extract has also been proven by researchers to have an antioxidant capacity [128], and it is well-known that giving antioxidants to rats can prevent ethanol-induced stomach damage [129]. Additionally, it has been discovered that soluble gel from fenugreek seeds prevents gastric lesion formation more effectively than omeprazole. The gastro-protective and anti-secretory properties of seeds of fenugreek may be caused by the polysaccharide content of the gel or the flavonoids [127]. This theory may be true because fenugreek seeds are acknowledged to have great quantities of flavonoids and it was proved that flavonoids guard the mucosa by reducing the growth of certain necrotic agent-induced lesions [130].

2.1.11 Zingiber officinale

Ginger (Family: Zingiberaceae) is a rhizome (Fig. 2k) that is utilized as a spice all over the world. Depending on the growth, harvesting, and processing conditions, this rhizome includes an extensive range of volatile and non-volatile chemicals in varying amounts [131]. Ginger is a crucial dietary component that has a carminative action, eases intestinal cramping, reduces strain on the lower esophageal sphincter [LES], and prevents bloating, gas, and dyspepsia [132–134]. It is a key ingredient in Asian medicine and has been utilized for a long time to treat a number of ailments, including digestive disorders like heartburn, gas, colic, vomiting, and diarrhea including pain in the abdomen, nausea, and cramping [135, 136]. The majority of the components of ginger that have been extracted by various analytical techniques are gingerols [137].

It improved the excretion of digestive enzymes. Clinical trials have demonstrated that ginger is just as active as dimenhydrinate [138] as well as being more efficient than vitamin B6 [139] in alleviating morning sickness and nausea during pregnancy. In addition, it has been suggested in the management of chemotherapy-related vomiting [140], gynecological laparoscopy [141], and postoperative preventive antiemetics [142]. Additionally, ginger is also suggested as a remedy for motion and sea sickness [143]. Ginger's exact mode of action is uncertain. It may, however, block receptors of serotonin and have antiemetic effects on the central nervous and gastrointestinal tract [144]. In a clinical trial, 100 mg ginger extract or 2 g of rhizome for 2 days was given and their effect on GI motility was examined [145]. The findings showed that the intervention group's gastrointestinal motility significantly improved when compared to the control group. Ginger has been demonstrated to quicken stomach emptying and increase antral contractions in healthy people [146]. In research, no variations were observed in the length of the fundus, GI symptoms, or the levels of the gut peptides like ghrelin, motilin, and GLP-1 of serum in individuals with functional dyspepsia [147].

2.2 The Herbal Formulations Used in Gastrointestinal Disorders

2.2.1 Triphala (India)

An Ayurvedic herbal formulation Triphala is made up of three herbs as shown in Table 2 [148, 149]. Tannins, ellagic acid, gallic acid, and chebulinic acid are their major constituents. These powerful antioxidants may be responsible for some of the formula's immunomodulatory effects [150–152]. Other bioactive substances found in Triphala include saponins, flavonoids like luteolin and quercetin, anthraquinones, fatty acids, amino acids, and several types of carbohydrates [151]. The human gut microbiome also converts triphala-derived polyphenols like chebulinic acid into active metabolites, possibly in vitro to reduce oxidative damage [153]. The usage of Triphala for gastrointestinal health, in general, is likely its most well-known benefit. Triphala extracts made from both aqueous and alcohol have been reported to stop diarrhea in animal trials [154]. Triphala also has enteroprotective properties, which are most likely brought on by its high antioxidant content, at least in part. In a mouse model, Triphala restored reduced protein, glutathione, and phospholipid amounts in the intestinal villi of the brush border while concurrently lowering myeloperoxidase and XO levels in the epithelium of the intestine [155]. Triphala had gastro-protective effects on stress-induced ulcers in rats [156]. Triphala was tested in a human clinical experiment on individuals with gastrointestinal diseases, and it was found to improve the occurrence, yield, and constancy of stools while reducing constipation, mucus, abdominal pain, hyperacidity, and flatulence [157]. The antioxidant properties and great quantities of flavonoids in Triphala were responsible for the healing effect, which also decreased colitis in mouse screening methods [158].

Triphala contains phytochemicals like quercetin and gallic acid that are known to encourage the evolution of Bifidobacteria and *L. bacillus* species by suppressing the

Table 2 Herbal formulations used in gastrointestinal disorders with their constituents

S.no	Formulation Name	Herbs used in the formulation	Indication	References
1	Triphala	Fruits of *Terminalia chebula* (family Combretaceae), *Terminalia bellerica* (family Combretaceae), and *Phyllanthus emblica* (Phyllanthaceae)	Appetite stimulation, gastric hyperacidity reduction, constipation, abdominal pain, and flatulence	[148, 149, 155]
2	STW-5 (IBEROGAST®)	*Iberis amara* (family Brassicaceae), Roots of *Angelica Sinensis* (family Apiaceae), flowers of *Matricaria chamomilla* L. (Family Asteraceae), fruit of *Carum carvi* L. (family Apiaceae), fruits of *Silybum marianum* (family Asteraceae), leaves of *Melissa officinalis* (family Lamiaceae), leaves of *Mentha x piperitae* (family Lamiaceae), *Chelidonium majus L.* (family Papaveraceae), and roots of *Glycyrrhiza glabra* (family Fabaceae)	Functional dyspepsia Irritable bowel syndrome	[166–171]
3	Peppermint oil (PMO)	*Mentha piperata* (family Lamiaceae)	Digestive tract smooth muscle relaxant Diarrhea Irritable bowel syndrome Antispasmodic	[172, 174, 177–179]
4	Zhizhu Kuanzhong	*Rhizome of Atractylodes macrocephala* (family Asteraceae), fruits of *Citrus aurantium* (family Rutaceae), roots of *Bupleurum* (family Apiaceae), and fruits of *Crataegus pinnatifida* (family Rosaceae)	Functional dyspepsia	[180, 181]
5	Rikkunshito RKT	Tuber of *Pinellia ternata* (family Araceae), roots of *Panax ginseng* (family Araliaceae), rhizome of *Atractylodis lanceae* (family Asteraceae) *Pachyma hoelen* (family Polyporaceae) *Aurantii nobilis pericarpium*	Dyspepsia Stress-induced gastric hypersensitivity Epigastric fullness, heartburn, burp, and nausea.	[184, 185, 194, 195]

(continued)

Table 2 (continued)

		(family Rutaceae), fruits of *Zizyphi fructus* (family Rhamnaceae)		
6	DA-9701	Seeds of *Pharbitis nil* (family Convolvulaceae) tubers of *Corydalis turtschaninovii* (family Papaveraceae)	Functional dyspepsia	[197, 198, 200–202]
7	Pudin Hara	Pudin Hara Pearls: leaves of *Mentha piperata* (family Lamiaceae) and *Mentha spicata* (family Lamiaceae) Pudin Hara Liquid: *Mentha piperata* (family Lamiaceae)	Indigestion, functional dyspepsia	[204]

formation of unwanted gut flora like *E. coli* [159–162]. Additionally, lactic acid bacteria have enzymes (such as tannase) that can break down plant tannins like the gallic acid in Triphala [163–165]. For instance, chebulinic acid, a polyphenol derived from Triphala, is metabolized by the human gut microbiota into products called urolithins that is able to fend off oxidative injury.

2.2.2 STW-5 (Iberogast®) (Germany)

A liquid concoction known as STW-5 is created by combining extracts from nine well-known herbs as indicated in Table 2, that were obtained using alcohol in a certain ratio. It is marketed in Europe as an over-the-counter drug and has been clinically used for many years in German-speaking nations [166, 167]. The concoction has distinctive ingredients, like extracts of well-known herbs produced by distinct extraction methods with stable quantities of components [167].

STW-5 demonstrated spasmolytic effects in an experiment using a guinea pig ileal muscle strip by decreasing acetylcholine and spasms brought on by histamine. Because of *Iberis amara* the basal resting tone is increased and the atonic segment is contracted. These double actions make it spasmolytic and tonic and were reliant on the basal tone of the gut. The duodenum, jejunum, and colon also experienced these effects [168].

315 individuals with functional dyspepsia as indicated using the Rome II criteria were included in a randomly, double-blind, placebo-controlled research. The human volunteers were randomly assigned to receive either a placebo or STW 5, 3×20 drops/day for an 8-week treatment after a washout period of a week. Six months were spent monitoring the patients. The gastrointestinal symptoms' (GIS's) evolution during the treatment period served as the primary endpoint. In both groups, the GIS improved. Following 4 and 8 weeks of treatment, the STW 5 group showed a

clinically meaningful improvement that was more than the placebo. Global evaluations by researchers and patients reaffirmed STW 5's appreciable superiority [169, 170].

The effectiveness and security of STW 5 in treating IBS were examined in one random, double-blind, and placebo-controlled research [171]. The test used a gastroenterological expert panel-developed abdominal symptom score, which contained eight specific IBS indications assessed on a 4-point Likert scale, as one of its major effectiveness endpoints. After a 1-week washout period, for four weeks, 300 patients were randomized to receive STW 5, two research medications, or a placebo. In comparison to the placebo, the IBS symptom score dropped by 1.5 points because of STW 5, which was clinically relevant and statistically significant ($p < 0.0004$). Similar results were found for the stomach pain, which was assessed using four-point Likert scales for each of the four abdominal quadrangles. STW 5 once more demonstrated a statistically significant advantage over placebo [171].

2.2.3 Peppermint Oil

Steam distillation is used to create peppermint oil (PMO) through plant leaves of *Mentha piperata* as indicated in Table 2 [172]. Its numerous constituents (>80) include 35–55% of menthol, 20–31% of menthone, menthyl acetate in 3–10%, cineol, and several other volatile oils [173–175]. Menthol, which naturally occurs as a pure stereoisomer, appears to be its main component and active element [174].

There are numerous lines of evidence that point to PMO's potential role as a digestive tract smooth muscle relaxant [174]. In guinea pig ileal smooth muscle, PMO and its ingredient menthol inhibit calcium channels, which aids in relaxing intestinal smooth muscle, according to in vitro studies [176]. A different investigation discovered that PMO greatly decreased the guinea pig coli's sensitivity to acetylcholine, 5-hydroxytryptamine, and histamine [99]. By limiting the uptake of extracellular calcium ions via voltage-dependent channels, they hypothesized that the PMO relaxes GI smooth muscle [99, 175]. PMO reduced stomach spasms when administered orally or topically [177, 178].

According to Rome III criteria, in a recent study, patients with mixed IBS or IBS with diarrhea participated in a randomized controlled experiment of 4 weeks to test the effectiveness and tolerability of a new PMO formulation intended to sustain the drug release within the small intestine. A solid-state customized enteric-coating matrix designed to deliver peppermint oil to the small intestine that is triple-coated with prolonged release and fewer potential side effects was used in their research. At the end of the experiment, the PMO group had a 40% reduction from baseline in the whole IBS scale scores when compared with the placebo group 24.3% ($p = 0.0246$). In addition, compared to the placebo, there was a superior perfection in numerous distinct GI symptoms and also in rigorous or intolerable symptoms [179].

2.2.4 Zhizhu Kuanzhong (China)

Since 2002, a proprietary fixed combination formulation known as Zhizhu Kuanzhong (ZZKZ) has been sold commercially in China [180]. Four herbs as indicated in Table 2 combine to make it. The primary ingredients Shan Zha and

Bai Zhu have been investigated in animal pharmacological investigations, and it has been found that they speed up intestinal propulsion and gastric emptying when compared to control treatments [181, 182]. Zhi Shi is frequently used as a TCM treatment for FD on its own. Zhi Shi demonstrated an inhibitory effect in in vitro tests on the impulsive retrenchment of the pyloric circular smooth muscle strip [183]. It has been demonstrated that chai hu has an anti-anxiety and antidepressant effect in addition to speeding up small intestinal transit time and gastric fluid emptying [180].

ZZKZ, a patented formula, enhanced intestinal propulsion and motility as well as stomach emptying in rats [180, 181]. ZZKZ was demonstrated to be highly efficacious than placebo for 392 patients meeting Rome III postprandial distress syndrome criteria when taken at a dose of 3×2 capsules daily for functional dyspepsia. This particularly enhanced satiety and fullness after meals. Since no serious side effects had been documented in any of the RCTs or post-marketing monitoring data, it suggests that this medication is safe [180, 181].

ZZKZ was shown to be non-inferior to cisapride in FD symptom control and gastric emptying in a limited Phase II, RCT with 403 FD patients [182]. In a study, St. John's wort and domperidone combined with ZZKZ at the same dosage of three capsules per day had comparable benefits on FD patients' scores for depression and anxiety [183].

2.2.5 Rikkunshito (RKT) (Japan)

As stated in Table 2 [184, 185], RKT is an extracted granule for oral use made up of a dried mixture of eight unprocessed herbs. RKT has been shown to improve GE, antral contractions, and fundic relaxation in addition to reducing GI symptoms like dyspepsia or reflux [186]. It has been proposed that each component of RKT exhibits synergistic effects through a complicated interacting route [187, 188].

By triggering the esophageal acid clearance mechanisms, RKT was able to minimize clinical symptoms and the amount of time that acid was present in the distal esophagus during 24-hour esophageal pH monitoring tests in a trial with eight children who had symptoms of gastroesophageal reflux [189]. In a pilot survey, RKT treatment for 8 weeks enhanced clearance of the esophagus by lessening LES residual pressure throughout swallowing and elevating the entire frequency of bolus transit and peristaltic contraction rate in esophageal multichannel impedance and manometry in 30 patients from PPI-refractory NERD [190]. Rikkunshito produced a relaxing effect on the stomach smooth muscles of a rat, which was brought about by the Ca2+-stimulated K+ channel being activated [191]. RKT is demonstrated to improve adaptive relaxation of the guinea pig stomach when it is isolated [192]. RKT demonstrated a high bile salt binding capacity and may guard against bile acid exposure harming the esophageal mucosa. Refractory GERD and duodenogastroesophageal reflux can both benefit from it [193]. RKT can improve stomach accommodation and reduce stress-induced gastric hypersensitivity [194]. In Japan, during a placebo-controlled, randomized trial with 42 patients having chronic idiopathic dyspepsia, the acetaminophen absorption technique revealed that RKT possesses prokinetic activity for enhancing gastric emptying, it also decreases upper gastrointestinal symptoms such as nausea, heartburn, epigastric fullness, and burp in comparison with placebo [195]. According to a randomized, parallel comparison experiment in Japan with 104 patients with GERD who were resistant to PPIs, the effectiveness of RKT with a standard dose of PPI on decreasing acid-related dysmotility symptom and reflux symptoms was comparable to that of a double dose of PPI [196].

2.2.6 DA-9701 (South Korea)

The Korean Food and Drug Administration approved the novel herbal medication DA-9701, which was created in South Korea, in May 2011 [197]. It contains ethanolic extracts of plants indicated in Table 2. These two herbs are extensively utilized as an herbal medication in Korea, China, and Japan since ancient times to treat gastrointestinal as well as gynecological disorders. Pharbitidis semen is employed as an intestinal peristalsis activator and an analgesic for the stomach [198]. Tuber of Corydalis is prescribed as an analgesic or an antispasmodic for the gastrointestinal tract [199]. The active ingredients in DA-9701 are corydaline and tetrahydropalmatine in Corydalis tuber and chlorogenic acid in Pharbitidis semen. The pharmacological investigation has shown that DA-9701 exhibits dopamine D2 antagonistic, 5-HT1A agonist, adrenergic a2 agonist, and 5-HT4 agonist action [197, 198].

According to the Rome II criterion, 462 Korean FD patients participated in a randomized, controlled, multi-center trial that revealed the effects of 30 mg DA9701 TID and 50 mg itopride hydrochloride TID on FD symptoms [200]. At 4 weeks, the itopride group had a responder rate of 36%, whereas the DA-9701 group had a responder rate of 37%. DA-9701 with itopride significantly decreased from baseline, and all consumer complaints related to gastrointestinal. In short research, FD patients according to Rome III definitions and the presence of H. pylori, the group having DA-9701 presented better indication recovery rates (73.3%) at 12 weeks as compared to the elimination group (60%). Due to the short sample size, there was no statistically significant difference [201]. In a subclass examination, DA-9701 greatly lowered the reflux symptom score in participants 65 years of age or older when compared to the placebo [202]. After taking 30 mg of DA-9701 TID for 24 days, 27 patients who satisfied Rome III's parameters for functional constipation showed improved involuntary movement of the bowel, stool form, and subjective symptoms of constipation [203].

2.2.7 Pudin Hara (India)

Two Ayurvedic preparations manufactured by Dabur India Ltd. called Pudin Hara Pearls and Pudin Hara Liquid include two Mentha species as shown in Table 2 and are intended for indigestion. Along with other ingredients, preservatives, and colors, each 180 mg of Pudin Hara Pearls contains 0.174 ml of Mentha oil obtained from the aerial part of *Mentha piperata*, and 0.034 ml of Spearmint oil (*Mentha spicata*, Aerial part, Oil). In addition to other ingredients, preservatives, and colors, each 1 ml or 20 drops of Liquid Pudin Hara contain 0.0337 ml of *Mentha piperata* oil.

One capsule of Pudin Hara Pearls (thrice a day) or ten drops of Liquid Pudin Hara was given to 79 individuals with functional dyspepsia after mealtimes for 5 days or until signs subsided, whichever came first. Based on improvements in indications such as nausea, acid regurgitation, heartburn, stomach discomfort, and upper abdominal bloating as well as the overall assessment of the investigator and patient therapeutic efficacy was determined from the baseline. Safety was evaluated based on the emergence of negative events and modifications to the hematological and biochemical profiles. Liquid Pudin Hara and Pearls of Pudin Hara dramatically reduced the symptoms of functional dyspepsia, including the above-mentioned conditions. Although no statistically significant variations were observed in the research products while comparing the effectiveness in treating the symptoms of dyspepsia Pudin Hara Pearls were more effective in treating bloating of the upper abdomen, heartburn, acid regurgitation, and stomach pain, while Liquid Pudin Hara was more effective at treating nausea and vomiting as well as the feeling of acidity. In any of the study subjects, no adverse events were recorded during the investigation. Pudin Hara Pearls and Pudin Hara Liquid could be used safely and effectively in treating functional dyspepsia [204].

3 Prospects and Challenges of Herbal Medicine Formulation

A single herbal remedy or medicinal plant may include hundreds of natural ingredients, and a polyherbal formulation has many times as many as one. Single active ingredient may practically be hard to identify in such a study, especially when a herbal product is a blend of two or more herbs [205]. Raw material quality is influenced by environmental factors, farming practices, and good collection techniques, such as plant selection and cultivation, in addition to intrinsic (genetic) aspects. It is challenging to conduct quality controls on the raw materials for herbal medicines due to a variety of factors. Correct identification of medicinal plant species, specific storage, and unique cleaning processes for diverse materials are significant requirements for the quality control of raw materials, according to good manufacturing practice (GMP). The main difficulties come in the quality control of final herbal medicines, particularly herbal mixtures [205]. As a result, compared to other pharmaceuticals, the overall specifications and procedures for quality control of final herbal products continue to be far more complicated. The World Health Organization (WHO) continues to support the implementation of quality assurance and control measures, such as National Quality Specifications and Standards for Herbal Materials, GMP, labeling, and licensing schemes for manufacturing, to assure the safety and efficacy of herbal medicines. The use of incorrect plant species, adulteration of herbal products, contamination, overdosage, misuse of herbal medications by consumers or healthcare professionals, and the combination of herbal medications with other medications are just a few of the causes of adverse effects resulting from the consumption of herbal medicines. Most manufacturers of herbal medicines are not properly informed about the value of taxonomic botany and documentation, and this presents specific obstacles during the identification and collection of medicinal plants used in herbal remedies. It is vital to use the most widely used binomial names for medicinal plants to avoid confusion caused by the common names. Botanists, phytochemists, pharmacologists, and other key players must work effectively together to monitor herbal medicine [205].

In human health care systems around the world, medicinal herbs have been crucial not only in treating illnesses but also as a potential resource for maintaining good health. The herbal industry has the potential to significantly impact the world economy. Future international labeling guidelines should effectively address quality issues given the rising use of herbal products. To comprehend the use of herbal medicines, standardization of methods and quality control data on safety and efficacy are required. The formation of businesses based on medicinal plants in undeveloped countries has been severely hampered by a lack of understanding of the potential social and economic benefits of doing so. Much research is being done on herbal medications to incorporate them into brand-new drug delivery systems [206]. Innovative approaches to reducing drug instability, like the use of suspension, biodegradable cellulose, therapeutic proteins, nanoparticles, and emulsifiers, can be especially helpful. Preventing drug deterioration brought on by environmental factors is a major issue when it comes to medication stability [207]. To maintain medication stability, certain procedures, including packing and container standards, must be followed. Pharmacokinetics and ADME research are essential for ensuring the efficacy, toxicity, and safety profile of herbal therapies because the side effects and toxicity of herbal treatments have been well-documented, including kidney damage, the development of stones, acute neuropathy, and newborn mortality. The validation of efficacy, safety, and toxicity levels occurs at the most crucial stage of developing herbal medications, which includes clinical trials and ethical considerations [207]. Such validation is necessary to compete with existing allopathic medicines and survive in the global medication market. For herbal medicine producers to maintain the quality of their products, competent authority regulations for quality and safety criteria are essential [208].

4 Conclusion

Numerous studies show that traditional people around the world frequently employ plant-based therapies or herbal medications to address digestive system problems. Different ethnic groups have employed a wide variety of herbs to cure different digestive issues from generation to generation. Herbal drugs are becoming more and more well-liked among Westerners because, when used properly, they have few negative effects. Recently, there has been a general trend toward a recovery of interest in a traditional healthcare system. People can treat a range of digestive-related ailments by regularly including herbal medicines in their diets, which can enhance how well the digestive system works. Numerous secondary metabolites or phytochemicals found in plants can have a part in the management and inhibition of certain gastrointestinal problems. These herbal treatments for digestion function in a variety of methods, counting encouraging effortless bowel movements, enhancing digestion, growing the incidence of bowel movements, purifying the body and eliminating contaminants, settling an upset stomach, and minimizing gas, bloating, and discomfort in digestion. Unfortunately, not enough research has been done on the vast majority of plant species utilized in indigenous traditional medicine in many underdeveloped nations. Triphala is a potent polyherbal blend with a wide range of medicinal benefits for preserving homeostasis as well as illness prevention and therapy. Numerous scientific investigations have documented evidence-based support for Triphala's many traditional uses. It may be possible to explain STW 5 (Iberogast) observed therapeutic effectiveness in treating hypotonic and spastic dysmotility symptoms of functional dyspepsia and irritable bowel syndrome, at least in part, by the pharmacological evidence that points to a dual-action principle. The practice of STW-5 as a prospective alternate medicine for functional gastrointestinal disorders, particularly functional dyspepsia and irritable bowel syndrome, will be made possible by further research on their involvement in the pathophysiology of FGIDs. Clinical experiments and in vitro investigations have shown that peppermint oil appears to reduce IBS indications, particularly stomach pain, by soothing smooth muscles in the stomach. It is necessary to have pertinent data derived from thorough studies to support the efficacy and security of PMO. Rats' intestinal propulsion and motility as well as stomach emptying were improved by the patented formula Zhizhu Kuanzhong. It was discovered to be more effective at treating FD when used alone or in combination with conventional Western therapy. RKT enhances stomach motor activity, together with gastric accommodation and emptying, and boosts esophageal clearance and motility, according to basic research and clinical investigations. DA-9701 increases stomach emptying and antral motility in healthy and sick situations, according to a number of preclinical and human investigations. Furthermore, it was asserted that DA-9701 might lessen constipation and GERD in the particular group. By using Pudin Hara Pearls and Pudin Hara Liquid, functional dyspepsia symptoms such as acid regurgitation, heartburn, a sense of acidity, stomach pain, and upper abdominal bloating were dramatically reduced. Both Pudin Hara Liquid and Pudin Hara Pearls may be used safely and successfully to treat functional dyspepsia. For the establishment of the scientific basis for activity and to more accurately assess the superiority, efficiency, and security of these formulations, ongoing examination of traditional plant medicines is necessary. Well-designed clinical trials will offer the required proof of efficacy to validate herbal medicines. In a small number of clinical trials, the safety and acceptability of conventional and herbal medicines used to treat digestive system illnesses have been examined. The findings generally demonstrate that there have been minimal side effects observed. Recent research on conventional plant-based therapeutics has produced evidence that supports additional studies in the hope that new treatments for digestive illnesses may be created.

Herbal Medicine and Pregnancy

23

Priyanka Devi and Prasann Kumar

Contents

Abstract

The usage of herbal medications is increasingly commonplace worldwide, and this trend is also noticeable among pregnant women. Pregnant women may use herbal medicine to improve their general health. Although self-diagnosis and self-dosing are common in herbal medicine, they are unsafe and highly discouraged. It is advisable to use herbs for pregnancy management only under the guidance of a midwife, physician, herbalist, naturopathic, or homeopathic doctor because each pregnancy is unique. This chapter discusses the use of herbal remedies during pregnancy and the types of herbal remedies used. Herbal medicines include herbs, herbal preparations, and finished products made from herbs, and they contain active compounds from plants with known or suspected therapeutic advantages.

To ensure the best outcome for pregnant women and their babies, herbal medicine products should only be recommended for use by individuals who are well-versed in the types of herbs, their parts (e.g., roots, leaves, etc.), dosage, and how they could be used (e.g., capsules, tonics, teas) before consuming herbs during pregnancy. Most pregnant women who use herbal medicine conceal their usage from their attending conventional medical professionals. However, most women were encouraged by their families and friends to utilize herbal medications because are considered safer, more effective, and had fewer adverse side effects than modern medicine. During pregnancy, herbs that are considered safe to use are usually those used for food and other related purposes. The most common form of these supplements is a tablet, a tea, or an infusion.

1 Introduction

In many societies across the globe, the use of medicinal plants to promote a healthy pregnancy and facilitate a smooth delivery has been a long-standing tradition. In the past three decades, there has been a noticeable surge in the availability of comprehensive literature on plant-based therapies in Western countries. Despite the medical community lacking substantial evidence to deem homeopathic remedies unsafe during pregnancy, this perception still endures. It is worth noting, however, that most natural remedies employed during pregnancy and labor have not undergone rigorous scientific scrutiny. While anecdotal evidence may offer some support for their use, it is imperative to establish scientific validation regarding their safety and efficacy.

Nevertheless, women in North America and elsewhere continue to rely on botanical remedies they have come to know through word of mouth or natural birthing literature. This study draws from a range of sources, including HerbClips, a resource provided by the American Botanical Council, and various herbal and pregnancy literature. These sources shed light on the subject [16].

Pregnancy triggers a series of significant physiological changes in a woman's body, often leading to a variety of discomforts such as nausea, vomiting, indigestion, and diarrhea. It is a common response for expectant women, including the use of natural remedies, to self-medicate to alleviate these conditions [54]. This trend has contributed to the substantial increase in the global utilization of natural remedies by pregnant women [14, 54].

The prevalence of natural medication use during pregnancy is influenced by various factors, including geographic region, ethnicity, cultural practices, and socio-economic status. To investigate this phenomenon, researchers conducted a cross-sectional study involving 9459 pregnant women across 23 countries in Europe, encompassing Western Europe, Northern Europe, Eastern Europe, North and South Americas, and Australia. Among the participants, 28.9% reported the use of herbal medicines during their pregnancies. Notably, the countries with the highest reported usage of natural medications were Russia (60.0%), Poland (49.8%), and Australia (43.8%) [57].

Furthermore, Hwang et al. [37] found that countries like Iran (49.2%), Egypt (27.31%), Bangladesh (70%), Iraq (53.7%), Palestine (40%), and Taiwan (33.6%) also exhibited a substantial prevalence of natural medication use among pregnant women.

While previous studies indicate the widespread use of natural medicines during pregnancy in sub-Saharan Africa [6], there remains a scarcity of data on the prevalence of herbal medicine usage among expectant women in numerous sub-Saharan African nations. This study provides insights into the reasons, potential adverse effects, and effectiveness of the most commonly used herbal medicines during pregnancy in sub-Saharan Africa and the varying frequencies of herbal drug utilization across different countries in the region.

The utilization of herbal medicine (HM) during pregnancy is a common practice, with the majority of users being female, and many continue using HMs even during pregnancy [24]. However, the prevalence of HM use during pregnancy can vary widely depending on factors such as region, race, culture, and socioeconomic status, ranging from 7% to 55% [24, 114]. For example, in Australia, 34% of pregnant women use HMs [27], while in the European Union, the figure is as high as 50% [36, 62]. In contrast, in the United States and Canada, 6–9% of pregnant women use HMs [64].

Pregnant women often turn to herbal products to support their health and address non-life-threatening conditions, viewing them as a safe and natural alternative to conventional medications, particularly for issues like nausea and constipation [27, 38]. Notably, some HMs, such as black cohosh (*Actaea racemosa*) and blue cohosh (*Caulophyllum thalictroides*), have a well-documented history of use as uterine tonics and labor inducers [27]. However, despite reports of associated risks [109], there remains a lack of comprehensive information regarding their safety and efficacy during pregnancy.

One key issue is the widespread availability of HMs without needing a prescription in many countries. This can lead to challenges when pregnant women self-prescribe HMs alongside traditional medications recommended by their healthcare providers [99]. Patients may not always disclose their use of HMs to their healthcare providers, often because they do not perceive them as potentially hazardous substances [1].

This chapter serves as a comprehensive exploration of the multifaceted landscape of herbal medicine use during pregnancy. Its primary objective is providing valuable education to medical practitioners and expectant mothers. It seeks to shed light on the prevalence of herbal medicine use among pregnant women and, more crucially, to highlight the potential interactions between herbal medicines (HMs) and conventional medications employed to manage underlying medical conditions or pregnancy-related issues.

Physiological changes that occur during pregnancy can trigger or exacerbate various medical conditions. For instance, hypertensive disorders, encompassing chronic hypertension, fetal hypertension, and preeclampsia, contribute to approximately 10% of pregnancy-related complications in the United States. Some expectant mothers grapple with preexisting conditions like epilepsy or asthma, with approximately 9% reporting a history of asthma. Moreover, the use of antiepileptic drugs (AEDs) during pregnancy has been associated with potential risks, including adverse effects like miscarriage, antepartum, and postpartum hemorrhage.

Within this chapter, we delve into the demographics of pregnant herbal medicine users and explore the risks associated with herbal medicine usage during pregnancy. By highlighting the key medical conditions that herbal remedies aim to address, we aim to provide a comprehensive understanding of the nuances surrounding this practice.

In essence, the use of herbal medicine during pregnancy is a topic that requires thoughtful consideration, well-informed decision-making, and the active engagement of healthcare professionals. By examining prevalence, risks, and interactions with conventional medications, we endeavor to equip both medical practitioners and expectant mothers with the knowledge necessary to make informed choices regarding herbal medicine use during pregnancy. This knowledge ultimately plays a pivotal role in ensuring the best possible outcomes for both mother and child.

2 Navigating Pregnancy: A Guide to Herbal Medicine and Medicinal Plants

Pregnancy is a remarkable period marked by profound physical and emotional transformations as women's bodies adapt to nurture and develop a new life. Pregnancy is a profound and intricate life-altering journey, encompassing a multitude of physical, emotional, and social transformations. This process typically spans 9 months and culminates in the birth of a child. This journey often brings about a host of typical symptoms, such as morning sickness, sleep disturbances, and heartburn. In response to these challenges, many individuals turn to herbal remedies and medicinal plants as an alternative or complementary approach to conventional medical care.

The various facets of the pregnancy voyage are summarized in Table 1. It's imperative to acknowledge each pregnancy's uniqueness and its individualized experiences. Consultation with healthcare professionals is indispensable for

Table 1 Key stages and aspects in pregnancy

Topic	Key points
Conception	Pregnancy begins with sperm fertilizing an egg.
	Zygote forms in the fallopian tube.
	Zygote implants in the uterine wall.
Prenatal development	Zygote evolves into an embryo.
	Divided into three trimesters.
	Each trimester is marked by changes and milestones.
Pregnancy symptoms	Includes morning sickness, fatigue, mood swings, and appetite changes.
	Symptoms can vary among individuals.
Prenatal care	Essential for a healthy pregnancy.
	Involves routine check-ups, prenatal vitamins, and screening for complications.
Diet and nutrition	Balanced diet crucial for fetal development.
	Avoidance of harmful substances like alcohol and specific medications.
Physical changes	Pregnancy results in weight gain, breast modifications, and abdominal expansion.
	Hormonal changes can lead to skin alterations like stretch marks.
Emotional changes	Pregnancy-related emotional adjustments due to hormonal shifts and anticipation of parenthood.
	Effective communication and emotional support are vital.
Maternal health	Monitoring the health of the expectant mother is paramount.
	Conditions like preeclampsia and gestational diabetes may require specific care.
Labor and delivery	Culmination of pregnancy with uterine contractions leading to birth.
	Various delivery methods, including vaginal birth and cesarean section.
Postpartum period	A phase of physical and emotional recuperation post-childbirth.
	Involves caring for the newborn and adapting to parenthood.
Challenges	Some pregnancies may face complications like ectopic pregnancies, miscarriages, or preterm birth.
	Awareness and timely medical intervention are crucial.
Parenting and childcare	Pregnancy initiates the lifelong journey of parenthood.
	Considerations include childcare, parenting approaches, and the well-being of both child and parents.
Support system	Quality of pregnancy and postpartum period depends on a strong support system including partners, family, friends, and healthcare professionals.
Cultural and societal factors	Cultural and societal factors influence an individual's pregnancy experience.
	Wide variations exist across different geographic regions and communities.
Fertility and reproductive health	Vital concepts for those trying to conceive.
	Infertility concerns and assisted reproduction options warrant discussion.

(continued)

Table 1 (continued)

Topic	Key points
Family planning	Decisions about family size and birth spacing significantly impact pregnancy discussions.
	Timing and methods of contraception are part of family planning.
Legal and ethical issues	Complex topics like surrogacy, adoption, and abortion are discussed in the context of pregnancy.
	These matters involve moral, legal, and psychological considerations.

personalized guidance and addressing specific concerns or medical conditions during pregnancy. Additionally, emotional support and open communication are indispensable components for expectant parents to navigate this transformative journey effectively.

Herbal medicine, an ancient practice deeply ingrained in human culture, involves using plants and their derivatives for therapeutic purposes [7, 8, 48]. Medicinal plants have been significant in various cultural traditions, serving as remedies for various health conditions [40–47]. The use of medicinal herbs and plants during pregnancy has garnered considerable attention due to the potential relief they may offer for the common discomforts experienced by expectant mothers. However, it also raises substantial concerns regarding their effectiveness and safety.

The use of herbal remedies and medicinal plants during pregnancy necessitates a careful evaluation, as it entails a delicate balance between potential benefits and safety, always with the overarching goal of safeguarding the well-being of both the expectant mother and the developing fetus. This discussion endeavors to provide participants with a comprehensive understanding of the subject, enabling them to make well-informed choices concerning their health and well-being during this transformative period, benefiting themselves and their unborn children.

This chapter section lays the foundation for a comprehensive exploration of the use of herbal medicine and medicinal plants during pregnancy. The associated potential risks that underscore the importance of seeking expert medical advice, identifying known safe herbs, discussing appropriate dosage considerations, exploring potential benefits, and navigating the legal aspects are summarized in Table 2. Furthermore, we will consider the varying responses of individuals to herbal remedies and complementary therapies, emphasizing the necessity for personalized guidance and informed decision-making.

In summary, safety should be a paramount concern for pregnant individuals, and consultation with healthcare providers is essential. While some medicinal plants and herbal remedies may be used cautiously to address common discomforts, they should complement rather than replace conventional medical care during pregnancy. Informed and open discussions with healthcare professionals are vital for making well-informed decisions regarding the use of herbal remedies during pregnancy.

Table 2 Aspects of herbal medicine and medicinal plants in pregnancy

Topic	Key points
Safety concerns	Limited scientific data on medicinal plants' safety and fetal effects during pregnancy.
Consultation with healthcare professionals	Pregnant individuals should always seek advice from healthcare providers before using herbal remedies.
Known safe herbs	Some herbs are considered safe during pregnancy when used in moderation.
	Examples: ginger, peppermint, and red raspberry leaf (in the third trimester with supervision).
